BUILDING.

*People built as soon as earth was made
Almost, because they might forget (they were afraid)
Earth did not make itself, but came of Somebody.
They laboured that their work might last, and show thereby
He stays, while we and earth, and all things come and go.
Come whence? Go whither? That, when come and gone, we know
Perhaps, but not while earth and all things need our best
Attention: we must wait and die to know the rest.—ROBERT BROWNING.*

THE ARCHITECT AND CONTRACT REPORTER. A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

FROM time to time the subject of illicit commissions crops up for discussion. The remark of the Lord Chief Justice in a recent case has given one of the opportunities for which some people appear to be on the look out. His Lordship said:—"Unfortunately in commercial circles, in which prominent men played a part, extraordinary mistakes occurred. But a principal who employed an agent to do work for him employed him upon terms that the agent was not likely to get secret commissions. The sooner secret commissions were not approved by an honourable profession the better it would be for commerce in all its branches." A gentleman who claims to have been a Fellow of the Surveyors' Institution for many years declares that the practices consist not only of secret commissions on the accounts for printing, bill-sticking, advertising, &c., particularly referred to by the Lord Chief Justice, but they also include the secret commissions received, and in many instances demanded, by surveyors, auctioneers and estate agents of 10 per cent. and even 15 per cent. on builders' accounts for repairing, altering and decorating house property, and commissions received on private sales of property from both vendor and purchaser. The Secretary of the Institution has pointed out that by one of the by-laws "A member shall not accept or give any illicit or secret trade or other discounts, commission or allowance in connection with any works the execution of which he may be engaged to superintend, or with any other professional business which may be entrusted to him, or any goods he may order on behalf of clients." Mr. ROGERS also adds that "It is rarely that offences of this kind are brought under the notice of the Council of the Institution. When they are, they are at once investigated; but the difficulty in the way of action consists in the fact that these transactions, being in their nature secret, are not always capable of legal proof." What is desirable is that, instead of trusting to rumour, some person would have the courage to accept the risk and announce boldly and publicly the names of the culprits and the circumstances of the offence. Anonymous statements cannot mitigate the evil if it exists, while they create suspicion against honourable men who would forfeit their own self-respect by the acceptance of a "tip." As allegations of the kind are sometimes brought against Government officials, one would think it would be easy to set up a commission to inquire into them. If it turned out the charges were proved and the offenders were made to suffer, it would be an object-lesson which would strike terror among men of a different class.

It was not supposed that the Italian Government would allow any body of foreign archaeologists to undertake the exploration of Herculaneum. With a Government like that of Turkey, antiquity is of small account; and as the majority of valuable objects which are discovered become the property of the SULTAN, he

acquires something without paying anything for it. The archaeologists are supposed to be rewarded by the pleasure of excavation. The sites operated on do not involve any interference with property. But at Herculaneum the case is different. The ancient city has been built over, and researches may cause much injury to property if not the destruction of many houses. It is consequently necessary that Italy should keep a strict watch, although the international commission would consist of men whose motives were entirely unselfish. Apparently Dr. WALDSTEIN has been rather premature in announcing that he possessed authority to make arrangements. The Italian Government would no doubt be gratified if he could raise sufficient money to enable the costly work to be undertaken. But the control would necessarily be in the hands of Italian officials. Herculaneum was of greater importance than Pompeii at the time of the destruction, and it can be taken for granted that works of art which would be more precious than any found at Pompeii are still entombed beneath Portici and Rescina. The examples which many years ago were met with and which are now in the Naples Museum are sufficient to raise expectations to the utmost. But the exploration must necessarily be costly, for it would be, perhaps, more economical to purchase much of the property in the new towns than to undertake the expense of underpinning the buildings.

THE Government have evidently resolved that the clause in the Factory Act relating to "a reasonable temperature" is not to be inoperative. An important case came before the city justices of Manchester on Wednesday which exemplifies the lenient and the later and more severe manner of enforcing the Act. In March last a firm in Ancoats whose premises were not adequately heated were asked by the chief inspector to carry out the necessary requirements. As there has been laxity in the administration the request was unheeded. On December 9 it was necessary to make another visit, and it was found that in one room the temperature was 40 degs. and in another 42 degs. A summons was issued. Finding the authorities were in earnest, one of the defendants called on the inspector, expressed regret and promised to undertake the necessary work without delay. When the case came before the Court the inspector said he did not press for a penalty, and only a nominal fine and costs were imposed. It was stated that one of the reasons for the delay was that with additional means of heating occupiers have to pay a higher rate of insurance. As was explained that cause is insufficient. The Act has to be obeyed. It was the first case of the kind tried in Manchester, and the factory owners in the district should at once take steps to have adequate heating in their works. It should also be remembered that under the Act much more than cotton factories are comprised.

ARCHITECTURE IN 1904.

THE most prominent event of the year that has passed is, in the domain of architecture, the manifestation of the preponderance of opinion within the ranks of the Royal Institute of British Architects in favour of registration, that is, the statutory recognition of the qualified architect as distinguished from the charlatan and quack, whose only claim to the title of architect is a brass plate and impudence.

Undoubtedly the expression of the views of the majority has been stifled for some time by the clever tacticians who have so long held sway in the Council of the Royal Institute, but 1904 has seen, by the help of a very small amount of organisation, the epoch-making pronouncement by the voice of the premier representative body of architecture that registration is both necessary and desirable in the interests of the art, the profession and the public.

This vital step in progress we must not, however, suppose will suffice for the immediate, or even the proximate, attainment of the goal to which the majority of architects are pressing forward. The clever tacticians are still in evidence and using their best endeavours to retard the inevitably slow advancement of the movement. The shape which registration is to take, the means by which it is to be made operative, are matters that are not to be easily determined without much deliberation and discussion. The leaders of the majority, confident in the strength of their cause, have already shown an almost too generous desire to give every opportunity for the expression of their opponents' views. Only within the last month a resolution was adopted at a business meeting of the Royal Institute, "That the registration committee appointed by the general body be allowed to co-opt additional members." Now the registration committee as at present constituted is overwhelmingly in favour of registration. The members to be co-opted can therefore hardly be other than able and representative men who are opposed to registration. This of necessity means more talk and delay in the work of the committee, even if the co-opted members have the grace to abandon tactics intended to retard and happily wreck the movement, and confine their attention to depriving registration as far as possible of what seem to them objectionable features. The advance that has been made during the past year has, we may feel confident, made registration certain of achievement, but we must possess our souls in patience for its ultimate realisation.

R.I.B.A. FELLOWSHIP.

Of considerable importance in connection with the ability of the public to distinguish between the qualified and unqualified architect is the resolution of the Royal Institute, taken during the past year, to admit to the ranks of Fellows after the end of 1906, save in exceptional instances, only those who have passed a qualifying examination. When this resolution becomes operative the Royal Institute may justly pose as a body that admits as members only those who are qualified architects, and who undertake to act as honourable practitioners.

ANCIENT LIGHTS.

The past year has seen the momentous decision of the House of Lords in the appeal case of *COLLS v. The Home and Colonial Stores, Ltd.*, a decision that goes far to render clear the law of ancient lights and vitally affects, at least in towns, the practice of architecture, both as an art and as a profession. The value of the decision has been recognised by numerous expressions of appreciation of the public-spirited action of Mr. J. HOWARD COLLS in carrying the case to the highest legal tribunal in the country. The case of *KINE v. JOLLY* shows, however, that one at least of the judges of the High Court considers that the leading case does not in all cases negative the granting of a mandatory injunction. This decision has, however, been reversed on appeal.

LONDON BUILDING ACT AMENDMENT.

Amongst important legal matters of the year is the proposed amendment of the London Building Act, 1894, foreshadowed by the report of the Building Act committee of the London County Council. This amendment refers to several functions of the Building Act, the formation and widening of streets with limitations of the height of buildings, the determination of building lines and regulation of projections therefrom, the arrangement of open spaces, light and ventilation to buildings, the provision of means of escape from buildings in the event of fire, the construction of buildings to lessen the risk of conflagrations, the method of dealing with dangerous and neglected structures, dangerous businesses, low-lying land. These and a host of other minor matters constitute a revision of the present Act of a most drastic character, and not only drastic but in some instances retrospective, as, for example, the provision "that every building (both new and existing) of more than one storey and exceeding 25 feet in height shall be provided with means of access to the roof, and with a parapet or guard-rail where necessary to prevent persons slipping off the roof."

That the suggestions of the Council's Building Act committee make for the increased safety and improved health of the inhabitants of London must be admitted; but in face of the strong opposition that may be expected in the Imperial Parliament from the representatives and guardians of vested interests, one can hardly regard the proposal of the Council as other than a *ballon d'essai*.

OWNERSHIP OF DRAWINGS.

The ownership of drawings for buildings that have been erected has occupied the attention of the High Court in the case of *GIBBON v. PEASE*, in which the decision in *EBDY v. MCGOWAN* has been held to determine that such drawings are the property of the employer and not of the architect, albeit that in *EBDY v. MCGOWAN* the drawings implicated were those for a non-executed building. The case of *GIBBON v. PEASE* is, however, we understand, to be carried to the Court of Appeal, when mayhap the judicial mind may be brought to see that an architect is a man who produces buildings and not merely a draughtsman. Contributions have been made by the Royal Institute of British Architects, the Society of Architects and some few practitioners, to the cost of adequately fighting the appeal.

WORKMEN'S COMPENSATION FOR ACCIDENTS.

The operation of the law relating to workmen's compensation for accidents has been under the consideration of a departmental committee, whose report has been issued during the past year. This report establishes that on the whole the present law has worked satisfactorily, but that amendment is desirable, so that in all cases an injured workman shall receive a reasonable compensation for his pecuniary loss. The employer, who is to be the representative of the body politic in paying this compensation, must protect himself by insurance, and the committee appears to anticipate that for the protection of the workman from loss by the insolvency of employer or insurance company some system of national insurance may require to be established. The man who builds is, of course, the ultimate source of the compensation to the injured workman, and the cost of building generally is thus increased.

ELECTRICITY IN FACTORIES AND WORKSHOPS.

The prevention of accident, as well as the preservation of life and property, have received further assistance by the issue of regulations from the Home Office under the Factory and Workshop Act for the use of electricity, which has been certified to be dangerous in factories and workshops for the purpose of bringing it within the scope of the Act.

CATHEDRALS.

The past year has seen some memorable events in the history of our cathedrals. On July 19 His Majesty

the KING laid the foundation-stone of the new cathedral at Liverpool, and the foundations of the building are in course of construction. The tower and spire of Truro Cathedral have been completed, and the benediction ceremony took place in January last. The new west front of Hereford Cathedral has been dedicated by the Archbishop of CANTERBURY, although there still remains to be completed the renewal of the fronts of the north and south aisles. In the sister isle the nave and aisles of the new Belfast Cathedral have been so far completed that they are usable for service, and enable us to judge to some extent of the measure of success attained by Sir THOMAS DREW's attempt to deviate from the Mediævalism that is the prevalent flavour of our modern cathedrals down to Truro and Liverpool. In Armagh the Roman Catholic cathedral of St. Patrick has been consecrated by the papal legate, Cardinal VAN-NUTELLI, after being in progress for sixty-four years; it having been commenced in the year 1840.

On the other side of the picture we have had the report of Mr. W. D. CARÖE, architect to the Ecclesiastical Commissioners, on the appalling state of decay into which the central tower, or Angel Steeple, of Canterbury Cathedral has been allowed to fall. The Caen stone, of which the tower has been built, has crumbled and decayed to such an extent that the steeple was found to be actually dangerous, and an immediate commencement of repair has therefore had to be undertaken. The decay has been to a certain extent evident for some time; but on the urgent representations of Mr. CARÖE scaffolding was erected to facilitate closer inspection, from which resulted the knowledge of the even greater mischief than had been anticipated. The terrible extent of the detrition was evidenced by nearly a hundredweight of fragments falling on to the scaffold on one windy day.

Though not fully of cathedral character, the Abbey Church of Bath is, nevertheless, a national monument of sufficient importance for note to be taken of the fact that in this case also careful examination by an expert architect has revealed unrecognised, if not unsuspected, dangerous deterioration of the stability of the central tower. This was struck by lightning in August of last year, and although the damage from this cause was less than might be expected, Mr. T. G. JACKSON, R.A., found that from the expansion by rust of iron cramping the pinnacles of the tower and of the choir had been dangerously affected. Mr. JACKSON also found and called attention to an urgent necessity for the strengthening of the flying buttresses that were being overpowered by the thrust of the nave vaulting.

The example of Canterbury Cathedral and Bath Abbey Church point the necessity to the custodians of our national monuments for periodical examination by expert architects of the buildings under their care. Wise owners of freehold estates are accustomed to have inspections made of their property at regular intervals, though let on repairing leases, and those who have the charge of the architectural masterpieces of our country should exercise no less care in the fulfilment of their obligations as national trustees. In no instance, moreover, is the truth so evident of the proverb that "A stitch in time saves nine," as in the upkeep of buildings, and early attention would often render unnecessary those hysterical and frantic appeals for help from the public to repair the consequences of neglect.

DULNESS IN THE BUILDING TRADE.

The past year has seen a continuance and increase of that lessened demand for labour in the building trades which has been the unvarying theme of the Board of Trade reports since 1900. This is the infallible touchstone that tells of the decline in architectural activity which, though real enough, we might be inclined to doubt if we judged merely from the evidences of building going on around us. Yet we hear that architects, as a rule, have not been busy during the past year. Even though in general business there seems to

be some slight improvement in trade and money is a little cheaper than it was, the swing of the pendulum towards more prosperous times, if it has indeed commenced, has not gone far enough as yet to carry much benefit to the building trade, which as it is the last to feel depression, is also the last to experience a general revival of trade. The public has to make its money by trade before it can spend it, either for pleasure or profit, in bricks and mortar.

Necessary and utilitarian building goes on, but investment and speculation are reduced to a minimum, and municipal enterprise is stifled. Even the London County Council adopted the report of their improvements committee that it is inadvisable to seek powers in the next session of Parliament for the carrying out of "numerous important and desirable improvements." At the same meeting of the Council was approved the decision of the highways committee not to submit any fresh proposals for next session in connection with tramway work. As the Council had found itself obliged to issue a loan of five millions sterling at the low price of 90 earlier in the year, and had, moreover, been staggered by a proposal from the corporate property, charities and endowments committee to accept a rent of 3s. 2d. per foot for a plot of land in Kingsway for which members thought 5s. would be a fair price, it is hardly surprising to find that a check has been administered to the progressive instincts of the Council. The land to let in the Holborn to Strand improvement has again failed to find bidders at auction, and is still keeping unproductive millions of the ratepayers' money. If all the "important and desirable improvements" which have been for the present shelved are of like nature with the abandoned wild-cat scheme of buying up Charing Cross station and rebuilding Hungerford bridge, the ratepayers of London ought to be thankful that financial stringency prevents the autocrats of Spring Gardens from still further increasing the unproductive indebtedness of the Metropolis.

LONDON COUNTY HALL.

One improvement is undoubtedly necessary—the proper housing of the County Council and its ever-increasing staff. The actual money waste of the present haphazard want of system, with employes scattered in all directions, is beyond doubt enormous, to say nothing of the want of efficiency that necessarily results. Spring Gardens itself is a rabbit warren that would be a disgrace to the poorest or smallest borough council in the Metropolis, and we can only hope in the interests of the ratepayers that the task which has during the past year been entrusted to a committee of the Council may have a more fortunate ending than any of the past suggestions, which have for one reason or another been negatived, and that a suitable site may speedily be found on which an adequate building, worthy of the county of London, may be erected. So urgent is the necessity that almost any site, if only sufficiently large, should be acceptable without needless cavil. A perfect site is probably unattainable, and to any site that may be suggested objections will be possible. The one essential and indispensable condition, in our opinion, is that the site should be amply sufficient not only for present requirements but for future extension on a large scale.

The importance of providing for future extension is illustrated by the action of the Bradford Corporation, who have during the past year determined on an enlargement of their present town hall buildings at a cost of 70,000*l.* Bradford town hall is comparatively a modern building, but that of Sheffield is still more so, and yet nearly 40,000*l.* is to be spent on the extension of the latter.

ASYLUM, WORKHOUSE AND INFIRMARY BUILDING.

Of the architectural work which has been commenced in the past year a large proportion has consisted of such unfortunately necessary work as the provision of

asylum, workhouse and infirmary accommodation—lunacy, poverty and sickness are not checked by the dearthness of money or the decline of municipal credit.

The Bristol Board of Guardians have started to expend 160,000*l.* in the extension of their workhouses at Stapleton and Eastville, and the provision of a separate institution for the accommodation of all the imbeciles and epileptics chargeable to the Guardians.

The West Riding County Council having during the past year completed the first portions of their mammoth asylum at Storthes Hall, Huddersfield, at a cost of nearly 200,000*l.*, have started to provide accommodation for another 600 patients, thus advancing to the proposed goal of an asylum for 2,000 cases which, with the necessary staff, will probably mean a total population of 2,500 persons. The erection of these enormous institutions has, however, been adversely criticised by the Lunacy Commissioners in a recent report, pointing out that specific troubles, as "asylum dysentery," are to be feared in the aggregation of a large number of imbeciles in one asylum. The limit of size that appears to the Commissioners to be desirable is fixed at 800 to 1,000 inmates, any excess beyond which makes for a positive increase in the cost of maintenance per head.

The enlargement of the Bucks County Lunatic Asylum was completed during the year at a cost of about 55,000*l.*

The new Royal Infirmary, Manchester, has been commenced by the selection of the plans of Messrs. EDWIN T. HALL & JOHN BROOKE, after a competition limited to twelve selected architects. The infirmary is to contain 504 beds, and the estimated cost of the selected design is 324,000*l.*

A smaller hospital has similarly made the initial step by the selection of the designs of Messrs. H. H. & M. E. COLLINS for the rebuilding of the City of London Lying-in Hospital, in a limited competition of six firms of architects. The competition estimate of cost is in this case 20,000*l.*

The erection has been commenced of a new out-patients' department for St. Bartholomew's Hospital, London, from the designs of Mr. E. BLAKEWAY FANSON. The department is on an extensive scale, as may be gathered from the size of the out-patients' waiting hall, which will be 140 feet long and 45 feet wide, and capable of seating 850 people.

At Seacroft, Leeds, there has been completed during the past year a new fever hospital from the designs of Mr. E. T. HALL, at a cost of over 200,000*l.* and accommodating 452 patients.

VENTILATION.

A somewhat amusing incident in connection with hospital construction during the past year has been an acrimonious discussion between Messrs. HENMAN & COOPER on the one side, and Mr. G. H. BIBBY on the other. Messrs. HENMAN & COOPER are the architects of large hospitals at Birmingham and Belfast, both of which are ventilated on the "plenum" system. Mr. BIBBY is apparently the henchman of a well-known system of "natural" ventilation. The amusing part of the discussion, to the outsider, is the display of partisan spirit, in which each side endeavours to exalt the merits of its favourite system, and to belittle those of its opponent. The broad-minded architect recognises that each system has its merits and each its limitations, and that in ventilation as in most other departments of architectural activity there is no universal panacea for all cases. To sum up briefly, the plenum system is effective but costly, the natural system is cheap but of limited efficiency.

IMPORTANT BUILDINGS COMMENCED.

Amongst important buildings commenced during the past year have been the new public offices and town hall at Acton, Middlesex, for which the design of Mr. W. G. HUNT was selected in a limited competition. The competition estimate of Mr. HUNT's design was

52,946*l.* This, by the way, was a competition in which the award of the assessor, Mr. J. MACVICAR ANDERSON, has been very severely criticised, and has given much dissatisfaction in architectural circles. In fact, the assessor's selection seems to please nobody except the Acton Council, the assessor and the fortunate competitor. As these, however, are the parties most intimately concerned, others must put up with the reflection that once more it has been shown that the single assessor system is not the satisfactory solution of the competition problem, and that there is a good deal to be said in favour of the jury system, practically universal on the Continent.

Her Royal Highness Princess HENRY OF BATTENBERG has laid the foundation-stone of a National Nautical School at Portishead, near Bristol, which is being erected from the designs of Mr. EDWARD GABRIEL, at a cost of 30,000*l.*, to take the place of the training ship *Formidable*. Amongst the commendable features of the new building may be mentioned the construction of the floors of the dormitories of solid balks of timber tongued together, a method which may be regarded as the most reliable form of fire-resisting floor that can be constructed.

Additions to Sunderland town hall, at a stipulated cost of 30,000*l.*, formed the subject of an open competition, for which the designs of Messrs. WILLS & ANDERSON were successful.

A new Stock Exchange for Manchester has been started, the designs of Messrs. BRADSHAW & GASS being selected in a limited competition. The estimated cost of the building was 30,000*l.*

Liverpool, the rival of Manchester, has set out to add to the many fine buildings already to be found in the city by the erection of a new Cotton Exchange, at a cost of something approaching 150,000*l.*, designs by Messrs. MATEAR & SIMON having been selected in a competition restricted to local architects.

The new town hall at Stockport has been commenced and the foundation-stone laid. The design is that of Mr. A. BRUMWELL THOMAS, and was selected in competition. The amount of the builder's contract is 56,881*l.* At Tottenham the foundation-stones have been laid of the new municipal offices, public baths, fire station and coroner's court. The designs which are being carried out are those of Messrs. TAYLER & JEMMETT, which were successful in the open competition. The buildings will cost nearly 60,000*l.*

An important extension of the British Museum has been commenced on the south side of Montague Place, where is to be erected a building on the northern side of the old reading-room that will form an annexe to the old library and to the exhibition galleries. The architect to whom the work is entrusted was chosen in a somewhat novel manner. A list of suitable architects was requested and submitted by the Royal Institute of British Architects, and from the list the Government selected the name of Mr. J. J. BURNET, of Glasgow.

THEATRE BUILDING.

A considerable amount of activity has been manifested during the past year in the erection of theatres. A new theatre has been completed in Glasgow, styled the King's Theatre, from the designs of Mr. FRANK MATCHAM, at a cost of about 50,000*l.* The accommodation is intended for 2,000 persons. In London a new theatre with a seating capacity of 1,120 has been commenced on a site at the corner of Aldwych and Drury Lane. This is being erected from the designs of Mr. W. G. R. SPRAGUE for Mr. MURRAY CARSON. Another theatre and music hall, from the designs of Mr. SPRAGUE, has been commenced on a site at the corner of Tottenham Court Road and Great Russell Street. This will hold the large number of 4,000 persons. Within the last week the reconstructed Lyceum has been completed from the designs of Mr. BERTIE CREWE, and the former home of high-class drama has become a "two-shows-a-

night" music hall. Mr. CREWE is also the architect of a noteworthy illustration of the magnitude of the alien immigration, a theatre in Whitechapel wherein dramas will be performed in the Yiddish tongue. This is to seat 2,000 persons and will cost 45,000*l.* The close of the old year has seen also the completion of a remarkable theatre of varieties or music hall in Mr. OSWALD STOLL's Coliseum at the Trafalgar Square end of St. Martin's Lane, erected from the designs of Mr. FRANK MATCHAM.

In connection with theatre building, we may note that Liverpool has taken in hand the regulation of the details of theatre arrangement and construction, in order to safeguard the lives of playgoers.

NOTABLE BUILDINGS COMPLETED.

Amongst the notable buildings completed during the year has been the new wing of the Law Society's house in Chancery Lane. This was opened by their Majesties the KING and QUEEN, and has been erected from the designs of Mr. H. PERCY ADAMS. The new wing is remarkable for the clever treatment in detail both of the exterior and the interior. The Cartwright Memorial Hall, Bradford, erected from the designs of Messrs. J. W. SIMPSON & E. W. MILNER ALLEN, to the memory of Dr. CARTWRIGHT, the inventor of the power-loom and other machinery in connection with the textile industry, has been completed and opened. The most valuable site in the City of London, at the corner of Cornhill and Lombard Street, has received the recently-completed new offices of the London, Liverpool and Globe Insurance Company, erected from the designs of Mr. J. MACVICAR ANDERSON. Another important City building, the new London and Provincial Banking premises, at the junction of Lothbury and Old Jewry, has been finished from the designs of Mr. ARTHUR C. BLOMFIELD, at a cost of about 55,000*l.* The immense extension of the Savoy Hotel, from the designs of Mr. T. E. COLLICUTT, has also been brought to completion during the past year, and is a strikingly original addition to London's architecture. The first portion of the new buildings of the Leysian Mission, City Road, has been completed at a cost of 112,000*l.* from the designs of Messrs. BRADSHAW & GASS, of Bolton, and was opened by the PRINCE and PRINCESS OF WALES. At Southend-on-Sea there has been completed and opened the new Hôtel Métropole, which has been erected at a cost of more than 300,000*l.* from the designs of Mr. JAMES THOMPSON. In Finsbury Square, London, two striking buildings have been completed, the one at the west corner of the north side of the square, the other at the west corner of the south side. The former has been erected from the designs of Mr. JOHN BELCHER for the Royal London Friendly Society, and the latter from the designs of Messrs. GILBERT & CONSTANDUROS, as the head-offices of the London and Manchester Industrial Assurance Company. The new town hall of High Wycombe has been completed and opened. This has been erected from the designs of Messrs. BATEMAN, BATEMAN & ALFRED HALE, of Birmingham, which were selected in open competition.

LOCAL BY-LAWS.

The difficulty under the existing conditions imposed by the requirements of local by-laws in erecting cottages at prices commensurate with the rents that their occupants can afford to pay has raised a considerable amount of discussion during the past year, and the subject has been forcibly brought to the notice of the public by the apparently harsh treatment of Sir WILLIAM GRANTHAM. This has been emphasised by the appearance of a Judge of the High Court as defendant in a rural police court, the magistrates of which were hardly bold enough to do more than attempt to compromise the matter. A practical step towards the mitigation of the evil has been taken by the attendance of a very influential deputation before the President of the Local Government Board, as a result of which it is

to be hoped that some modification may be made of Section 276 of the Public Health Act, 1875, by which option is given to the rural district councils in their discretion to apply to the rural districts the by-laws suitable to the urban districts. This is the root of the trouble. The model by-laws for urban districts make for increased cost of building, and though this may be necessary for the welfare of the public in towns, the case is radically different in rural districts. It would be well if all rural district councils were to follow the example of that of Chertsey, who unanimously appointed a committee of farmers to consider their existing by-laws with a view to their alteration so as to permit, on the recommendation of their medical officer, of the erection of cottages in the rural districts of wood and corrugated iron, for letting to labourers at cheap rents. Wood and corrugated iron are not the only materials which might be employed for cheapness. The not yet extinct art of "cob" walling, for example, has much to recommend it, and new materials of useful quality are by no means few.

SCHOOL ARCHITECTURE.

The working of the new educational system of the country has by most of the county councils been made the occasion of a false economy in the appointment of officers to replace the experienced architects who have specialised in schools. As these officers are expected to devote their whole time to the work for salaries that average some 300*l.* a year, it may readily be understood that the school architecture of the future will hardly be marked by the exercise of the skill and experience that have been bestowed upon it in the past, and that in the interest of scholars, teachers and the standard of education it urgently requires.

LONDON TRAFFIC.

The problem of London's congested street traffic is still engaging the attention of the Royal Commission on London Locomotion, which has collected during the year a large amount of evidence from many who may be supposed to be experts in the subject. As practical steps of improvement may be noted the reopening after widening of London Bridge, the commencement by the London County Council of the new Rotherhithe tunnel by the acceptance of the tender of Messrs. PRICE & REEVES at 1,088,484*l.*, and the construction which is now proceeding of the underground tramway in Kingsway from Theobald's Road to the Strand.

CONFLAGRATIONS.

In fire prevention object-lessons have been afforded during the past year by three calamitous conflagrations in the United States. The burning of the Iroquois Theatre at Chicago, with a terrible loss of life, though comparatively little damage to the building, points to the paramount necessity for theatres of easy, direct and ample exits and automatic sprinklers for the stage. The conflagration at Baltimore, which practically destroyed a section of the city some three-quarters of a mile long by half a mile broad, has taught the necessity for the adequate subdivision of fire risks, and the utility of properly protected steel and concrete construction, whilst the weakness of terra-cotta, tile and stone as modes of fire-resisting construction has been overwhelmingly manifested. Similar lessons were enforced by the fire at Rochester, U.S.A., which, although not so serious as that at Baltimore, was sufficiently so to cause a loss of some half million pounds sterling.

In our own country we have had serious losses of important examples from "the stately homes of England" in Hanley Castle, Worcestershire; Earls Barton Grange, Northamptonshire, and Uffington House, Lincolnshire.

The lesson taught by the American conflagrations of the value of concrete protected steel for fire-resisting construction has added emphasis to the interest taken in architectural circles during the past year in the

subject of ferro-concrete, which requires only a modification of existing building by-laws to take the prominent position it deserves.

APPOINTMENTS.

Amongst appointments that may be noted during the past year are that of Mr. FELIX NEVILLE CLAY, as architect to the Board of Education, in succession to Mr. E. R. ROBSON; of Mr. WALTER L. SPIERS, as Curator of the Soane Museum, consequent on the decease of Mr. G. H. BIRCH; of Mr. C. H. REILLY to the Roscoe Chair of Architecture at Liverpool University, left vacant by the resignation of Professor SIMPSON, the lectures during the interregnum being delivered by Mr. F. R. FARROW; of Mr. JOHN MURRAY as Crown Surveyor, on the decease of Mr. ARTHUR GREEN; and of Mr. SYDNEY PERKS as Surveyor to the Corporation of London, on the resignation of Mr. ANDREW MURRAY.

HONOURS.

Honours allotted to members of the architectural profession include the addition of Sir HENRY TANNER, architect to the Office of Works, and Sir ASTON WEBB, R.A., past president of the Royal Institute of British Architects, to the scanty roll of titled architects; whilst the Royal gold medal was awarded to the distinguished French architect and savant, M. AUGUSTE CHOISY.

OBITUARY.

The obituary list includes the names of Mr. WILLIAM PAIN, Mr. H. SAXON SNELL, Mr. BARROW EMANUEL, Mr. PERCIVAL GORDON SMITH, Mr. PETER PAUL PUGIN, Mr. GEORGE HENRY BIRCH, Mr. WILLIAM ALFRED ROYLE, Mr. JOHN KELLY, Mr. JAMES WILLIAM BROOKER, Mr. EDMUND LAW, Mr. RICHARD KNILL FREEMAN, Mr. WILLIAM HARRY RAWLE, Mr. W. E. MITCHELL, Mr. J. S. STEWART, Mr. JOSIAH HUNT, Mr. CHRISTOPHER O. ELLISON, Mr. E. A. LANSDOWNE, Mr. HENRY ARTHUR HUNT, Mr. WILLIAM NAIRNE TAIT, Mr. J. LEWIS THOMAS, Professor ROBERT KERR, Mr. JOHN NORTON, Mr. W. H. F. SAMES, Mr. WILLIAM FREEMAN, Mr. CHARLES JOHN FERGUSON, F.S.A., Mr. FRANCIS W. BEDFORD, Mr. RICHARD MAWSON.

THE CATHEDRAL OF ST. ASAPH.*

WE have grown so accustomed to speak of St. Asaph's, St. Davids and St. Andrews as ordinary bishoprics, it is not always realised that they originally formed a peculiar designation. As a rule, not only in Great Britain but in other parts of Christendom, bishoprics are associated with the names of cities or territories. If we go back to the time of St. PAUL we find him directing the appointment of elders in every city. The city then included the *paroikia*, or suburbs. A bishop's diocese would therefore comprise not merely the city in which he dwelt, but the districts around it over which he exercised ecclesiastical jurisdiction. In other words, the ancient parish and the ancient diocese were conterminous. In course of time it was necessary to entrust authority over smaller districts to some of the clergy; as they grew more numerous they were formed into groups of ten—decem—and the superintendent of each group became known as the decanus or dean. Wherever Imperial administration existed, or Rome held direct or indirect sway, the names of dioceses were derived from cities in which the bishop lived. Ephesus, for instance, was a long-established city before St. JOHN settled in it.

In a country like Ireland, which had not in any way imitated Roman administration, there were no cities. Every clan, after the conversion of the country to Christianity, insisted on having its own bishop, and this explains how St. PATRICK is credited with appointing

over 360 bishops during his life. In Ireland the names of dioceses are in many instances those of districts rather than of cities, such as Meath and Clonmacnoise, Ossory and Ferns, and in some cases, like Kilmacduagh, they are supposed to commemorate individuals.

Wales recalls two of its saints in the names of dioceses, viz. St. Davids, after the patron who was supposed to have founded the see. It was, however, called at one time Menevia. St. Asaph's should have been known as St. Mungo's or St. Kentigern's if justice always prevailed in naming, just as, on a like principle, America should be called Columbia. St. MUNGO was one of the great missionaries of the sixth century. He founded a monastery at the place which is now known as Glasgow. Then there was some dispute with the king or chief of the region, and he went to Wales, where near another river Clwyd he established a second monastery. The monks of a later time gained a reputation for their discernment in selecting picturesque sites for their settlements. But it must be said St. KENTIGERN gave them an example, for the spot he selected is still recognised as a subject for landscapists. In a country like Wales, where there were rival chiefs, the establishment of a monastery must have been no easy task. But men like St. KENTIGERN accepted trouble as a blessing in disguise. Scotland had, however, claims upon him, and when the affairs which drove him from the North were settled he returned and lived at Glasgow until his death, which took place about the year 601.

Founders of sees and prominent ecclesiastics in those days appear to have had the right of nominating their successors. In that way ASA, or ASAPH, one of the monks, became head of the monastery and bishop of the district. There are some legends connected with him, but we do not live in the ages of faith, and there would be little use in repeating them. ASA and ASAPH are both Jewish names. There was an ASAPH who was one of DAVID's musicians, and to whom some of the Psalms are attributed. But St. ASAPH was, it appears, a native of Wales.

The church which was used in those days must have been of the simplest kind. It was probably constructed of timber. So remote a district was liable to be often invaded, and marauders were never deterred by the sanctity of a church or monastery. Over the history of St. Asaph there was a cloud for centuries, which no efforts appeared to be able to pierce through. Indeed, there are doubts whether at various periods any people, laymen or monks, were sufficiently courageous to live there. According to BROWNE WILLIS:—"The continuance of the church of St. Asaph in early times without a bishop may be further evidenced from its situation on the great road where all the armies took their route on making incursions from England into these parts of Wales; the inland parts being impassable by reason of the hills and forests, so that St. Asaph may, before the eleventh century, be not only supposed to be left without a resident bishop, but also without inhabitants." In the twelfth century there are records of men who are described as bishops of St. Asaph, but it is difficult to say whether they ever discharged any functions in the place. Among them was GEOFFREY OF MONMOUTH, the author or translator of the fabulous "History of Britain," which, if of little value as a chronicle, has exercised an important influence in supplying scenes which have been utilised by poets and dramatists.

It is not until 1282 that a light, if a lurid one, is thrown upon the cathedral of St. Asaph. The bishop of that time was known as ANIAN II. Originally he was a Dominican and a foreigner. When EDWARD I., before assuming the crown of England, resolved to journey to Acre and the Holy Land, the friar accompanied him. In 1268 he was consecrated Bishop of St. Asaph. It was a difficult period to hold the office. LLEWELYN, the Welsh prince, was bound as a vassal of the English throne to swear fealty to EDWARD, but he contrived to

* See Illustration.

evade the duty. He intended to assert the independence of Wales. The country was invaded by the English, and the prince was compelled to submit. He was ordered to pay a fine of 50,000*l.*, to cede tracts of land, and to do homage to the king at Rhudlan, now known as Ruthin, and London. Peace, however, was of short duration, and eventually LLEWELYN was slain. ANIAN was supposed to have sympathised with him, and in consequence was deprived of his see. Archbishop PECKHAM then stood in favour, and he was able to obtain Bishop ANIAN's pardon. The cathedral had been destroyed in the course of the war, and the king wished to have a substitute for it erected in Rhudlan. That project was, however, abandoned, and ANIAN was allowed to build a new cathedral. A pastoral letter was issued by Archbishop PECKHAM, in which he authorised the Canons of St. Asaph to carry the Book of the Gospels, called "Eveggulthen," belonging to the cathedral, through the dioceses of Lichfield, Hereford and Wales, to collect subscriptions to carry out the work.

It may then be assumed that the oldest part of the cathedral dates from the close of the thirteenth century. In 1341 there is a record of the construction of a new lady chapel. Apparently they were either additions, or the buildings commenced in the thirteenth century had fallen out of repair, for in 1381 we read of works in progress. The deacons—or monks in charge of ten other monks—and overseers were expected to find six competent workmen on every day, with the exception of Sundays and feast days, who were to be employed in a quarry called Rubram, in order to obtain stone for the works at the cathedral. In the reign of HENRY VI. there were more troubles in Wales, and "the church cathedrall of St. Asaph, with the steple, bells, quere, porch and vestiary, with all other contents, stalls, desks and alters was brent and utterly destroyed." The cathedral, after the partial destruction by OWEN GLENDOWER, was allowed to lie in ruins for years. Bishop REDMAN towards the close of the fifteenth century is said to have raised the walls and to have put on a new roof.

After the Reformation the cathedral was kept in decent condition. WILLIAM MORGAN in the beginning of the seventeenth century reslated the roof. JOHN OWEN destroyed the throne which Bishop REDMAN had erected, but he set up a new wainscot pulpit, as well as seats and forms for the congregation, in addition to a large organ. During the Civil War the cathedral was not respected. According to BROWNE WILLIS, a postmaster named MILLES seized on the episcopal palace and turned it into a tavern. He kept his horses and oxen in the body of the church, tied up and fed his calves on the bishop's throne and other parts of the choir, removed the font into his yard, set it in the ground and made use of it as a hog trough. After the Restoration GEORGE GRIFFITH expended money on repairs. The famous ISAAC BARROW restored the north and south aisles, covered them with lead and wainscotted the eastern end of the choir. WILLIAM FLEETWOOD repaved a great portion of the building. In February 1714 the upper part of the tower was blown down, causing great damage to the choir. The reparations were carried out by Bishop JOHN WYNNE. We obtain a glimpse of the cathedral in the eighteenth century from the diary of Dr. JOHNSON, who says:—"We went to church at St. Asaph—the cathedral, though not large, has something of dignity and grandeur. The cross aisle is very short. It has scarcely any monuments. The quire has, I think, thirty-two stalls of antique workmanship. On the backs were Canonicus, Prebend, Cancellarius, Thesaurarius, Precentor." Afterwards Bishop SHEPLEY removed the ruined chapter-house and introduced what was supposed to be improvements in the cathedral. The roof of the cathedral was lowered in 1810, and afterwards one of the WYATTS covered the building with stucco.

The late Professor FREEMAN visited St. Asaph in 1854. He described it as follows:—

The first appearance of St. Asaph is disappointing in two respects; first, because even with those who previously know what it is like, its title of cathedral causes an involuntary comparison with buildings of an altogether different class; secondly, because of its over-neatness and its faulty arrangements. But when these feelings are got over, there is much to admire in St. Asaph. If anyone came upon it suddenly as the parish church of a small Welsh town, it would excite as much rapture as it now does disappointment. Its outline, from most points of view, is perfect, and its details though very plain are highly interesting. The church with which it most naturally occurs to compare it is Brecon Priory. To that noble building it must, even in its best days, have been decidedly inferior; but, while its old choir and chapter-house were standing, it was probably by no means so immeasurably inferior as it appears at present. No corporation aggregate in the kingdom has less to be said against it on the score of repairing and keeping clean of churches than the Dean and Chapter of St. Asaph. No church was ever in more perfect repair, or in a more perfect state of cleanliness. In fact, it is overdone; the church is too neat and trim, the churchyard is too much like a garden and too scrupulously kept under lock and key.

Fourteen years afterwards, that is, in 1868, it was decided to have the building restored, and the task was entrusted to Sir GILBERT SCOTT. He removed the parts which were out of keeping with the original style of the church, and endeavoured to recreate a building belonging to the end of the thirteenth and beginning of the fourteenth centuries, with what success the illustrations will show.

THE WATTS EXHIBITION.

WHEN EMILE ZOLA visited Rome a few years ago, M. HÉBERT, who had been Director of the French School, acted as *cicerone* in the Sistine Chapel, and explained to him the paintings of MICHEL ANGELO. Politeness dictated that the novelist should ask to see some of the French painter's own works. The reply he received was:—"After visiting the Sistine Chapel one is not allowed to see works by HÉBERT. You can see them in Paris, where there is not so redoubtable a competition as here." The words were becoming in the mouth of a modern master who had spent a great part of his life in Rome. Between the sublimities of the Tuscan artist and the Italian peasant scenes of the Frenchman there was a wide difference. But M. HÉBERT understood the limitations of his powers, and, although a professor, he acted wisely in not attempting to cope with MICHEL ANGELO. If the executors of the late GEORGE FREDERICK WATTS, who have contributed seventy-seven out of the two hundred and forty-eight examples now to be seen and enjoyed at Burlington House, and the other contributors to the exhibition, were invited to send their pictures and drawings to an exhibition in the neighbourhood of the Vatican, they need have no fear they would suffer depreciation by the proximity of the great figures on the roof of the Papal chapel. What is no less remarkable is that the Englishman's works would hold their own in Venice. A more interesting assemblage of paintings was never shown in any winter exhibition. As a rule, an exhibition of "a deceased master of the English school" is rarely successful, owing to the general absence of unity. A painter is satisfied when a purchaser selects one of his works. Only in exceptional cases can he imagine that two or more will ever be seen together. It would be imprudent

to sacrifice temporary attractiveness to provide for their appearance in the Academy after he has passed away. But Mr. WATTS, either by the adoption of fixed principles or from some other causes which we need not investigate, produced works which, as we now see them, support one another in making a pleasurable impression. He preferred canvases of certain dimensions. The hangers were consequently able to dispose them in a more symmetrical manner than is usual in an exhibition. Each room becomes an interesting experiment in decoration which well deserves the notice of owners and conservators of picture galleries. Some connoisseurs are sure to maintain that a different arrangement would be more successful. In such a case it may be believed that a chronological order is necessitated, and undoubtedly it would have its advantage. But for the purposes of display and for a show that will be attractive, we doubt whether the present arrangement could be surpassed.

The large gallery and three other galleries are occupied with Mr. WATTS's oil-paintings, while the water-colour room is mainly devoted to his drawings. The examples comprise portraits produced at different periods, landscapes and imaginative subjects. They begin with his own portrait at the age of seventeen, and may be said to come to a close with the unfinished portrait of himself on which he was engaged in 1904. There is also the remarkable marble bust of *Clytie*, and in the courtyard is the mounted figure which was erected last year, and which we believe was intended for Rhodesia. It will thus be found that the painter's remarkable versatility is displayed. It would have been an advantage if works which are in other galleries in London could be lent for the occasion. But the collection at Burlington House, incomplete as it is, is calculated to impress the visitor with the greatness of the artist and his noble labours during seventy years.

We hope we shall not be considered captious or following the example of the Greek shoemaker if we begin by pointing to the remarkable absence of anything which could be considered in the least degree as architectural amidst so large a collection. We are only endeavouring, like POLONIUS, "by indirections to find directions out." The great painters of Europe have utilised architecture, not merely because it supplied noble forms like those we see in RAPHAEL's paintings, and offered contrasts to natural forms, but because architecture, whether great or small, is a human creation rather than an imitation like painting and sculpture. By endeavouring to present man as independent of it there is incompleteness. Mr. WATTS's indifference produced a worse result. Pictures which otherwise would be admirable are marred by his treatment of objects which were constructed. For instance, there is a portrait of himself dated 1853, which is invaluable as an indication of the direction towards Venice of his thoughts at the time. It is described as a "three-quarter figure, in a red robe, standing in front of a balustrade facing the spectator." The truth is the painter appears in the most ridiculous of all positions, *i.e.* when a man stands before a tailor to be "fitted on." Mr. WATTS's arms hang helplessly, he looks sheepish, and evidently he was apparelled in the Venetian robe for the first time. The incongruity of a modern collar and necktie might be pardoned, but the so-called balustrading is merely a wretched piece of wooden skirting painted white. It occupies half the background and makes the entire picture lose its harmony and become irritating to the eye. In another picture, entitled *Prayer*, belonging to the Corporation of Manchester, we see a delicate girl on her knees with her hands resting on a table. Her dress is that red-orange which the painter loved, heightened by red braid, and she wears a red fillet in her hair. This is not the prayer of a model but genuine devotion. Unluckily, the table employed is one of those with a spiral stem which hawkers consider to be indispensable in small suburban houses. The effect of

it is worse than the skirting in the portrait. We could point out other instances of the same crass inattention to details of building and furniture. In that way Mr. WATTS separated himself from the great artists of the past. Worse still, he imposed a limitation on his powers. Man is a social animal, and therefore in all schools "interiors" are common. In the collection at the Academy that fact is ignored. Occasionally we see a portrait of a mother and a child, or two sisters standing as if there was no relationship between them. But from the majority of the paintings the conclusion must be drawn that man is a solitary being. Domestic life appears to be unknown, and there is no case of a number of men or women coming together for any purpose. With such a subject as *Paolo and Francesca* he could not avoid depicting two ghostly figures in an embrace; in painting *Britomart* it was necessary to introduce the nurse, and the Redcross Knight would be incomplete without UNA. JACOB required ESAU as a foil and a few figures in the background, but evidently Mr. WATTS felt he could express his thoughts sufficiently by single figures. To show men in social life, in council, in united labour, or in worship, it would be necessary in most cases to represent a building or part of one, and that was not a task he cared to undertake. In the small picture, *When Poverty comes in at the Door, Love Flies out at the Window*, he was compelled to show an interior, but the model of it might have been derived from a toy-shop. We have no desire to disparage Mr. WATTS's great ability. But when he is to be compared with other painters it is only fair that the conditions should be equalised. He endeavoured to be original and he succeeded, but he shirked many of the difficulties which his predecessors and contemporaries encountered.

The exhibition also shows that he was not always superior to his time. There are a great many of his earlier portraits which are no better than those by men who gained no fame. His own portrait representing him at the age of seventeen is unfinished, and it might have been inspired by one of the engravings after a portrait of SHELLEY, the poet. The portrait of his father produced two years afterwards is unpretending. *The Wounded Heron* of 1837, as a study in white and greys, is a very remarkable work. It would be interesting to know whether it was copied from reality, for if not the painting becomes still more remarkable. *Aurora*, showing "a partially draped female floating in the clouds surrounded by amorini," might have been suggested by one of FROST's paintings. In the same year, however, he attempted the subject of *Caractacus* in the competition for the cartoons. It was believed at the time that the efforts to deal with epic subjects on a large scale would have a beneficial effect, and in the portraits which followed we see an improvement in WATTS's style. He was enabled by his premium to travel to Italy, and the view of Fiesole shows a susceptibility to nature, but an indifference to buildings. We see too in *Time and Oblivion*, which belongs to 1848 and which measures 6 feet 5 inches by 9 feet 5 inches, that he had come under Florentine influences and was not afraid to grapple with abstractions on a very large scale. His own description of the picture is:—"The forms of Time and Oblivion, rising above the sphere of the terrestrial globe, are poised in mid-air betwixt the orbs of day and night. Time, as the type of stalwart manhood gifted with imperishable youth, holds in his right hand the emblematic scythe, while Oblivion, with bent head and downcast eyes, spreads her mantle of darkness over all." This work was the beginning of a long series of attempts to deal with abstractions.

The years which followed are represented in the Academy by portraits. In 1859 there is one of Lord TENNYSON, and in 1861 one of MOTLEY, the American historian, which in size and treatment correspond with works which were presented to the nation. In 1862 we have the *Sir Galahad*, a full-length figure standing

beside a white horse, and apparently in mute astonishment at the vision revealed to him. This might have been suggested by the mysterious etching of DÜRER, *The White Horse*, which remains one of the puzzles of art. The position of Mr. WATTS could not fail to be assured by his figure of the Arthurian knight. But it was not until 1867 that he was elected an Associate of the Royal Academy.

There is no date attached to *The Mother of Giorgione*, which abounds in so many of the characteristics of the Venetian master it might well pass for a work by him. But *The Eve of Peace*, produced in 1863, reveals how well Mr. WATTS had assimilated the qualities of the best Venetians. The warrior, who is in armour with a richly-adorned surcoat and his sword in his hand, bows his head as if in supplication for peace. It is a noble figure with splendid colour. But *Choosing*, which belongs to 1864, shows that the painter, if he pleased, could easily have become a popular artist. It is a half-length of a little girl with some rose-buds in her hand, but who seems to have found a rival charm in a bush of camellias. To the following year must be credited the *Esau*, a three-quarter length figure, clad in very heavy drapery, part of it being a sheepskin, and holding a spear in his hand. There is nothing particularly Biblical about it, and it is one of the least important of the works exhibited. That in the same year the *Fata Morgana* was seen—a nude figure flying low and accompanied by a sprite—is a revelation of the diversity of WATTS's thoughts at the time. He was one of those men the character of whose next work could not be anticipated. His *Aspiration*, a young man in armour holding a standard, was evidently a portrait of ARTHUR PRINSEP, who was afterwards a general. In the same year was seen his marvellous likeness of Dr. JOACHIM, the violinist. A small landscape, *All the Air a Solemn Stillness Holds*, would be admirable and fully expressive of the subject if it were not for a haystack and farm-buildings on one side. If he had intended to suggest that man's works disfigure the beauty of earth, he could not produce a stronger example.

It was about the same time he executed the likeness of JOHN STUART MILL. In it, as in the TENNYSON, we seem to have an expression which is intended to suggest the working of the mind over complex problems. In the effort broken colouring counts for a great deal, but it is evident that both faces were worked out by a vast number of delicate strokes. It is remarkable that a painter who had resolved to confute the statement that it is impossible to find the mind's construction in the face should never have attempted the production of poetic characters. A HAMLET or a LEAR, a MERCUTIO or a JAQUES, if painted by him, would be of more worth than many pages by commentators. It was not only perplexed philosophers he was capable of presenting. There is no more characteristic portrait of MILLAIS than that painted by WATTS in 1871. His Dean LIDDELL is a marvellous revelation of an aristocratic Don who was also possessed of intellectual power, while his Sir JOHN SIMEON might serve as a type of an Anglo-Saxon gentleman. His head of Mrs. LANGTRY will hereafter be more convincing of her loveliness than any of her later portraits or innumerable photographs.

The following explanation which Mr. WATTS gave of one class of his works has been reprinted in the catalogue:—

The great majority of these works must be regarded rather as hieroglyphs than anything else, certainly not as more than symbols, which all art was in the beginning and which everything is that is not directly connected with physical conditions. In many cases the intention is frankly didactic; excuse for this, generally regarded as exasperating, being that it has been found, not seldom, that the attempts to reflect the thoughts of the most elevated minds of all ages, even in an unused and halting language, have not been without interest at least, if without profit. Whatever type may have been used, Classical, Mediæval or other, the endeavour has been to impress distinctly the

direction of modern thought, and in all except two cases, reference to spiritual dogmas has been purposely avoided.

In the old days an attempt to point a moral generally required several figures. Mr. WATTS generally contrived to express his thoughts by means of two. *Love and Death*, *Love and Life*, *Jacob and Esau*, *Death and Innocence*, *Diana and Endymion*, and so on, have a subtlety of meaning in addition to their attractions as figures. He evidently thought out his subjects completely, for when he made a second version the difference between it and the first is very slight. Thus in *Love and Life* the man's forward foot in one is only partly pressed against the rock, while in the other both feet serve as a base. In the larger *Love and Death* a dove is introduced in the foreground cowering before the figure "feared of man," and there is a slight variation in the steps to the house. Mr. WATTS's love of duality is so marked that his representations of the Three Graces or the Three Virtues become rather remarkable.

It cannot be said that at any time his powers began to fail. It might even be supposed that in his last years he was progressing. There is no trace in discordant colours of that affection in the eyes from which TURNER and MULREADY suffered. The *Trifles Light as Air*, in which amorini are ascending and rivalling birds and butterflies, is one of the most delightful works exhibited. He was not afraid to introduce an iridescent bubble in it which is a *coup de main*. The version of DIANA and ENDYMION, a favourite subject with him, which he painted in 1903, is superior to those produced at an earlier time. *The Two Paths* of the same year is his most successful landscape. His *Lilian* in last summer's exhibition was by some considered to be below the artist's average standard, but that was owing to its surroundings. In the present exhibition it appears among relatives, and must be accepted as a masterpiece. It has some of the characteristics of a fresco, and there is a pathetic interest in finding a similar treatment recurring in so many of the artist's works, although the opportunities offered to him for fresco were extremely limited and one of his two attempts was a failure. Another remarkable circumstance is that so many works should be seen which have not found purchasers. No doubt in some cases the painter declined to part with his works. But he was too great an artist to be admired by the multitude, and buyers of pictures may have thought his works would have a disturbing effect in a small gallery. Fortunately he was not a man whose inspiration depended on popularity. Whether under other circumstances the character of his works might have been more or less varied it is impossible to tell, but the 248 works which are to be seen in the galleries of the Royal Academy form a whole of which England may well be proud.

THE PUBLIC AUTHORITIES PROTECTION ACT.*

By Professor W. S. HOLDSWORTH, D.C.L.

IN these days of municipal trading the determination of the exact scope of the provisions of the Public Authorities Protection Act is a matter which nearly affects all classes of the community, and none more nearly than the classes of architects, engineers and builders. The title of the Act indicates its object. It is an Act "to generalise and amend certain statutory provisions for the protection of persons acting in the execution of statutory and other public duties." The Act does not apply to proceedings by any department of the Government against any local authority; but it does apply to all proceedings taken in the United Kingdom against any person "for any act done in pursuance or

* 56 & 57 Vict. c. 61.

execution or intended execution of any Act of Parliament, or of any public duty or authority, or in respect of any alleged neglect or default in the execution of any such act, duty or authority." It gives to persons sued under these circumstances the following advantages:—(1) The benefit of a short period of limitation. The action does not lie unless it is begun six months after the act complained of, or, in the case of a continuing injury, within six months after the cessation of such injury. (2) If the defendant is successful he gets not merely party and party, but solicitor and client costs—the plaintiff must pay the whole cost of the litigation. (3) There are other provisions giving to defendants similar advantages as to costs where they have made a sufficient tender before action brought, or where the plaintiff, before beginning proceedings, has not given to the defendant a sufficient opportunity of making such tender.

Some points arising on the construction of the Act have already been judicially settled. It is clear that the Act does not apply to bodies such as a railway company or a pier company. It is true that such bodies as these are constituted by Act of Parliament, and often perform public duties laid upon them by statute; but they are essentially commercial undertakings, and carry on their duties to earn a profit for shareholders. The Act applies to public bodies who carry out their duties not simply in order to make a profit, but because they are a part of the established government of the country. Such bodies, if a profit is made, apply it to public purposes. For practical purposes we can draw the line by asking whether any given body is established primarily to trade or primarily to govern.* Again, it is clear that the provisions as to costs do not take away the discretion of the Court to disallow costs if it sees fit,† and that the provision giving to the successful defendant solicitor and client costs relates only to the costs of the original action, and not to the costs of an appeal.‡

The most important question of all arising upon the construction of the Act has not yet been settled. This is the question whether all the acts and defaults of public bodies come within the Act, and, if not, where the line is to be drawn between the cases which fall within the Act and the cases which do not. In other words, can any public authority for any act demand the privilege of the short period of limitation, and the privilege of getting, if successful, solicitor and client costs conferred by the Act? It is admitted that this is an unsettled question upon which opinions may differ.§

The actual cases decided upon the construction of the Act have shown that the Act affords protection to public authorities in a great variety of instances. Thus it has been decided that it applies to an action against a municipal corporation for an injunction to restrain the corporation from allowing water to escape from their aqueduct and flood the plaintiff's land;|| that it applies to an action against the Corporation of Preston for negligence in their management of the navigation of the Ribble;¶ and that it applies to an action against a municipal corporation for obstructing a stream in the course of the erection of an electric-generating station, and thereby causing the plaintiff's land to be flooded.** None of these cases, however, necessarily go the full

length of deciding that all proceedings against public authorities come within the Act. But in the case of *The Ydun** Sir FRANCIS JEUNE's dicta clearly point in this direction and give to the provisions of the Act the most extensive interpretation. "The question is," he says, "whether the protection of this section of the Act is given to municipal bodies in the execution of duties not strictly municipal or official, but duties arising in connection with a commercial enterprise which they are empowered by Parliament to undertake. . . . Even apart from authority I should have entertained little doubt on the point. It has been and may be questioned whether, and to what extent, municipal authorities should be authorised by Parliament to engage, possibly in competition with private traders, in what would otherwise be the subject of private commercial enterprise. But if Parliament decides that a public authority should be so authorised, if it confers on a municipality the right and duty to assume the functions of a trader, it clothes those functions with a public character, and makes them just as much public duties of a public authority as those for the performance of which that authority was created. If a municipality is authorised to supply water or gas, I can see no distinction between its acts, its contracts and its defaults in supplying those articles and its acts, contracts and defaults in repairing roads and maintaining street lamps. The analogy of the State itself may be invoked to negative any such distinction. The transmission of letters and telegrams, if not monopolised by the State, would doubtless be performed by private enterprise. But surely the State acts just as publicly and officially in its administration of the Post Office as of any other of its departments." This extensive view of the interpretation of the Act has been followed in two cases. In the case of *CHAMBERLAIN and HOOKHAM v. Bradford Corporation*,† the Corporation was sued by the plaintiffs for the infringement of their patents for electric meters in the course of their installation of electric light under their statutory powers. The plaintiffs having failed to prove their case, KEKEWICH, J., held that the Act applied, and that the defendants were entitled to solicitor and client costs. In the case of *PARKER v. London County Council*‡ the Act was applied to an action against the County Council for negligence by a passenger in one of the Council's trams.

This extensive view of the interpretation of the Act has not yet had the sanction of the Court of Appeal. In the case of *JEREMIAH AMBLER & Sons, Ltd., v. Bradford Corporation*,§ *VAUGHAN WILLIAMS, L.J.*, pointed out that though the case of *The Ydun*|| was affirmed by the Court of Appeal, nothing was said by the Court which involved an approval of the very wide grounds upon which the decision of Sir F. JEUNE was based. "I mean," he says, "that the judgments in the Court of Appeal do not necessarily affirm the proposition that the Act applies to municipal trading under the authority of a special Act or order which a corporation or other public body chooses to obtain, just as any private person might do without being under any obligation so to do. The public authority in regard to such trading is, in fact, a mere volunteer, and it may be urged that, as the public authority is under no obligation to exercise the statutory authority which it has obtained . . . there is no reason why a public body trading in competition with private traders should be protected as to either costs or the time within which an action should be brought."

The Lord Justice pointed out, however, that this narrower view of the scope of the Act was in conflict with the case of *CHAMBERLAIN and HOOKHAM v. Bradford Corporation*. It is clearly also in conflict with *PARKER v. London County Council*, but in the latter case *CHANNELL, J.*, though he held that he was bound by

authority to say that the Act applied, confessed that he might have taken the less extensive view of the interpretation of the Act had he been deciding the matter apart from authority. "If," he said, "I were construing the Act for the first time, I should have been inclined, although bearing in mind the decisions of other judges upon the Act I should no doubt have been wrong, to say that, although a municipal body might be entitled to the protection of the Act in regard to matters done by them in the course of the construction of a tramway, they would not be entitled to it in regard to matters subsequently arising during its working, and that they would not be brought within the words 'neglect or default in the execution of such duty' merely because the act which they were doing would have been *ultra vires* unless done under statutory authority."*

It has been reserved for FARWELL, J., whose decisions have been before now noted for a happy combination of bold reasoning and sound law, to adopt this less extensive interpretation of the Act in the case of *SHARPINGTON v. Fulham Guardians*.† In that case he has decided that the Act does not apply to liabilities under a contract made by a Board of Guardians with a builder, incurred by reason of the negligence of the Guardians, and by reason of alterations made by them in the plans of the buildings which were the subject-matter of the contract. The learned judge adopted the view that the Act applies only to acts or contracts directly and immediately occasioned by the carrying out of public or statutory duties; and that it does not apply if the Act or the contract is only indirectly occasioned by, or incidental to, one of their public or statutory duties. In other words, if a public authority is authorised by statute to run a tramway or to instal a system of electric lighting, the Act will apply to all acts or contracts incidental to the work of constructing the tramway or installing the light, because they are under a duty to the public to do the work. But if they are authorised to guard the poor the Act will not apply to contracts to build houses for the poor because the duty to the public is not to build houses but to maintain the poor. "The public duty which is here cast upon the Guardians is to supply a receiving house for poor children; a breach or negligent performance of that duty would be an injury to the children, or possibly to the public, who might be injured by finding the children on the highway. In order to carry out this duty they have the power to build a house or alter a house, and they accordingly entered into a private contract. It is a breach of this private contract which is complained of in this action. It is not a complaint by a number of children or by a member of the public in respect of the public duty. It is a complaint by a private individual in respect of a private injury done to him. The only way in which the public duty comes in at all is . . . that if it were not for the public duty any such contract would be *ultra vires*. But that would apply to every contract."

Now it is a little difficult to see how this case can be reconciled with the dicta in the case of *The Ydun*, or with the decisions in *CHAMBERLAIN and HOOKHAM v. Bradford Corporation* and *PARKER v. London County Council*. On the other hand, it is not contrary to any decision of the Court of Appeal, and it is in accordance with what CHANNELL, J., would have considered to be the right interpretation of the Act had he not thought himself bound by authority to decide differently. It is certainly desirable that a decision of the Court of Appeal or the House of Lords should clear up this doubtful point of law.

On the general question as to which interpretation of the Act would be most expedient, it can hardly be doubted that there is far more to be said for the less extensive interpretation than for the wider interpretation. As was said in argument in one of the cases cited above,

"It is now becoming a matter of common occurrence for a corporation to enter into these quasi-commercial enterprises, and it is a serious thing if they can recover costs of litigation conducted, it may be, in the most expensive style." We must add, too, that it is a serious thing if persons are to be debarred from recovering by the lapse of the short period of six months. It may be that it is proper that public authorities should be protected from vexatious legal proceedings as to matters which fall directly and immediately within the scope of their public duties. It is a very different thing to extend that protection to all the various kinds of complaint which may arise from the manifold activities and enterprises of the modern public authority. Persons no doubt will differ largely as to the proper sphere of the activity of the State, according as their views tend in the direction of individualism or socialism. It cannot, however, be denied that the "municipal socialism" of the present day is on its trial. We do not as yet know enough of its results to give a final judgment as to its merits or defects. We cannot as yet define its limitations. If we are ever to come to a clear conclusion upon such vital matters we must be able to compare the results of municipal enterprise in various spheres of activity with the results of private enterprise in the same spheres. No trustworthy comparison can be made if, owing to the very great procedural advantages conferred upon public authorities, a severe handicap is put upon the ventures of private individuals.

WESTMINSTER CATHEDRAL.

ON Tuesday Archbishop Bourne delivered an address in the new cathedral, in the course of which he referred to the finances of that important work. He said he did not feel ready to make any appeal for the fund of the cathedral until it had been proved that the late Cardinal Vaughan was right in thinking that a metropolitan cathedral was really needed for the due development of the Catholic faith in England, and that the cathedral which he had erected was actually meeting that need. There was now no room for further hesitation, and he felt fully justified in echoing the appeal which the Cardinal made. Heavy liabilities had been incurred apart from the cathedral fund. The actual debt on the cathedral fabric was about 7,000*l.*, and since the Cardinal's death only 605*l.* had been received towards the building fund, excluding donations promised to Cardinal Vaughan, but not actually made until after his death. The Archbishop named some of the works which he desired to see carried out. At present they were engaged in completing the clergy house and the offices for the administration of the diocese, and soon they must begin to build a choir school. For those objects they made no public appeal. The baldachino over the high altar would be erected this year, and the other works as rapidly as the architects could complete designs. There must soon be a permanent installation of the electric light, the organ must be completed, and the approaches to the cathedral called for a considerable outlay. He earnestly appealed to Roman Catholics to liquidate the debt and provide for the furnishing and decoration of the cathedral.

THE NATIONAL GALLERY.

THE following additions have recently been made to the National Collection, and are hung in the Gallery at Trafalgar Square:—A portrait of Dr. Péral, by Francesco Goya, presented by Sir George Donaldson. It is hung in Room XIV. A portrait picture of Mr. and Mrs. Edwards, by Henri Fantin Latour, presented by Mrs. Edwin Edwards. Placed temporarily on a screen in Room XVI.

The following are placed in the Gallery of British Art, at Millbank:—A portrait bust in bronze of the late G. F. Watts, R.A., O.M., by Alfred Gilbert, R.A., presented by Mrs. Watts. This is placed with the Watts collection of pictures in Room VII. A small sketch in burnt clay of *A Nymph Reclining*, by Sir Francis Chantrey, R.A., presented by Miss Tye. Placed in Room VIII. A picture entitled *Outward Bound*, by Sir Edward J. Poynter, P.R.A., bequeathed by Mr. Henry Evans, of Derby. Hung in Room III.

* L.R. 1904, 2 K.B. at p. 505.

† L.R. 1904, 2 Ch. 449.

NOTES AND COMMENTS.

THE annual convention of the American Institute of Architects will be held on Wednesday, Thursday and Friday in Washington. The convention will open with an address of welcome by one of the commissioners of the district of Columbia. This will be followed by another from Mr. W. S. EAMES, president of the Institute. Reports from the standing and special committees will be read. The report on municipal improvement, prepared by Mr. FRANK MILES DAY, will be illustrated by lantern slides, showing the progress made in systematic municipal work throughout the country. It is proposed to give a brief outline of the work, illustrated by lantern slides, of the candidates who will be proposed for honorary and corresponding members of the Institute at the convention. Several amendments to the constitution, notices of which have been sent to all members of the Institute, will be acted upon at this meeting. A series of papers will be read during the convention on phases of architectural practice. "The Relation of the Architect with the Government" will be given in the report of Mr. GEO. B. POST, chairman of the committee on Government architecture. "The Selection of an Architect for Government Work without Competition" will be discussed by Mr. C. F. McKIM, Mr. THOMAS HASTINGS and Mr. J. C. HORNBLOWER; "The Selection of an Architect for Government Work by Competition," by Mr. JAMES P. JAMESON and Mr. IRVING K. POND; "Relations of Architects with Municipal School Work," by Messrs. R. CLIPSTON STURGIS, WM. B. ITTNER and WM. B. MUNDIE; "Financing Building Operations," by Mr. W. H. RUSSELL. Papers on "Office Organisation" are also expected. "Relations of Specialists to Architects" will be discussed by Mr. C. T. PURDY and Mr. EDGAR V. SEELER. There may also be read one or two papers relating to the lessons taught by the Baltimore fire.

THE compilers of the "Year-Book of New South Wales" do not hold out encouraging prospects for emigrants who are architects. In the colony, as in England and other places, there must be a peculiar fascination in architecture, for we are told "the number of architects in New South Wales is out of all proportion to the demand for their services, despite the steadily increasing activity in the building trades." Architects in practice have pupils, and other aspirants are receiving instruction in the Sydney Technical College and in private classes. The following advice is given:—"Professional architects intending to settle in the colony would find the ground almost wholly covered. Even in interior decorative work there is no lack of designers or artists, but the expenditure in this direction in Australian buildings is comparatively limited. Stained glass is mostly imported, but some is manufactured locally, although not to an extent sufficient to encourage the immigration of designers or skilled workers." Painters are likewise superfluous. Even among the teachers few attain more than a modest competence. There exists a subsidised society in Sydney, but although in the exhibitions there are many works, few are sold, and in consequence there is a tendency on the part of the more competent members to quit the Colony and seek their fortunes in Europe or America. There are also few openings for a black-and-white artist. Judging by the "Year-Book" the arts and sciences and literature are at a discount in New South Wales.

AN important arbitration case has been determined in Manchester, and the result cannot be satisfactory to either of the parties. The Municipal School of Technology is a large and important building, and the contract was confided in 1895 to Messrs. ROBERT NEILL & SONS, whose reputation is not confined to the city. A claim was made, arising out of extra work and delays caused by the Corporation and other contractors, which amounted to 38,483*l.* The question of prices was

referred to Mr. M. H. YOUNG, quantity surveyor, of London, and the whole claim was considered by Sir WILLIAM EMERSON. According to the award of the latter, the Corporation are to pay Messrs. ROBERT NEILL & SONS 19,920*l.*, together with their own costs and the taxed costs of Messrs. NEILL. The arbitrator's fees, including those of Mr. YOUNG, which are put down at 988*l.*, will have to be paid by the Corporation. Application will have to be made to the Local Government Board for authority to borrow 20,000*l.* to pay the sums awarded. The chairman of the education committee expressed regret that the subject should be the first that came before them in the New Year, and said he was surprised and disappointed with the result. But the surprise, we think, is likely to be shared by the contractors, who must have expected larger damages.

IN the latest number of *L'Art* there is a reproduction of a drawing by DAUBIGNY, the French landscapist, of the Houses of Parliament at Westminster. It was made during his visit to London in 1866. At that time the works were in progress for the Thames Embankment, and he was evidently struck by the contrast between the ground and the building. He selected a point of view from which he could see the Clock Tower, the great ventilator and the Victoria Tower, as well as the smaller towers fronting the Thames, and in the distance the four towers of St. John's Church, which must have puzzled him. It was a curious subject for an artist like DAUBIGNY to select. The article is by M. EMILE MICHEL, of the Institut. Among other articles we may point out one on the French opera by M. ADOLPHE JULLIEN; the Paradise of Ostend, by M. JEAN ROBIE; and a tribute to the oldest of French writers, M. PHILIBERT AUDEBRADÉ, by M. PAUL LEROI. We have referred to several of the large plates which were given during past years to the subscribers. Five of those for 1904 have just been issued. They comprise *A Lawn-Tennis Party*, after Mr. JOHN LAVERY; *Envoi de Fleurs*, after M. DE TOULMOUCHE; *Le Labourage Nivernais*, after ROSA BONHEUR; *Une Recluse dans la Vallée d'Optevoz*, after DAUBIGNY; and *Primavera*, after M. JULIUS ROLSHOVEN. When we remember that these large etchings, each of which would cost a good sum if sold by a printseller, with all the numbers of *L'Art* for a twelvemonth, can be obtained for a couple of guineas the liberality of the conductor appears incredible, and, *L'Art* might be taken for a philanthropic institution for the gratuitous dissemination of works of art of high class.

OVER sixty paintings and drawings by the late FREDERICK SANDYS are to be seen in the Royal Academy. Among them are the *Medea*, which in 1868 was rejected at the Academy, and the *Helen of Troy*, *Vivien*, *Morgan-le-Fay*, *Cleopatra*, *Penelope*, *Persephone*, and other works which, to some extent, have an historic sense, for they were admired by ROSSETTI, and were often referred to in his letters and in various other works relating to art. SANDYS can be claimed as belonging to the Norwich school, and if not one of the early pre-Raphaelites, he may be considered as one of the later members of the brotherhood. The famous parody of the *Sir Isumbras at the Ford*, by MILLAIS, was by him. He was a marvellous draughtsman, and classical and northern legends afforded him subjects which none of his contemporaries surpassed. But the studies he drew for his illustrations in magazines reveal that, in spite of his power, he made the most elaborate preparations. In one case we can see no less than six studies for a small wood engraving. It must be difficult to decide whether he worked best in oils, chalk, or in pen and ink. The *Judith and Holofernes* is a marvellous pen drawing; *Lady Greensleeves* in chalks is incomparable; while the *Mrs. Stephen Lewis*, an old lady in a black dress with a white laced cap, would assert itself in any collection of portraits. Certainly the SANDYS collection of drawings and paintings by themselves well repay a visit to the Academy.

ILLUSTRATIONS.

FRIEZE FOR NEW GAIETY RESTAURANT AND MESSRS. SHORT'S PREMISES, LONDON.

THE frieze consists of twenty-five panels with windows alternating. It comprises over forty figures 7 feet high each. They illustrate various subjects. On the Strand front is a series of panels representing Britannia and her Colonies, and another representing the Spirit of Progress with the Sciences and Industries on either side of her. The Aldwych front has a series of panels in which figures of SHAKESPEARE'S Comedy and Tragedy heroines are represented; these are terminated at either end by figures of Comedy and Tragedy on the Garden Thoroughfare front. The Strand end, Messrs. SHORT'S premises, has figures representing the Arts of Architecture, Sculpture and

Painting, and on either side are figures personifying Poetry, Literature and Music, instrumental and vocal. The Aldwych end of the Garden Thoroughfare has figures representing War, Justice, Charity and Peace, in the order named. The whole frieze is in Portland stone. The figure surmounting the dome of the theatre is a winged representation of Fame holding a laurel wreath and blowing a trumpet. The total height from base to tip of wings is 15 feet, the figure being 10 feet high. It is in teak wood, painted, and may possibly be gilded. Mr. HIBBERT BINNEY, St. John's Wood studios, is the sculptor, Messrs. ERNEST RÜNTZ & FORD being the architects.

NEW ROYAL COLLEGE OF SCIENCE, SOUTH KENSINGTON.

VIEW IN PALERMO.

THE excellent illustrations for which *The Architect* was indebted to Mr. AXEL HAIG have been unobtainable for a long time. We therefore intend to reproduce some examples of plates which, although

necessarily less elaborate than Mr. HAIG'S large etchings, are perhaps better adapted as examples for the architectural draughtsman. In his description of the plate now published Mr. HAIG wrote:—

Those who are in the habit of dispensing with the services of cicerones may stroll about and get lost in the out-of-the-way places in such a curious town as Palermo, and come upon sights, in their perhaps perverted ideas, fully as interesting or characteristic as any of the "Lions"; and it was in one such pilgrimage that this view was encountered and noted down. Here you have a glimpse of the old Duomo, and most prominent in the view the great belfry crowning a part of the Archbishop's palace. A suggestion is given of the western façade with its flanking towers, and a very small portion of the north side, altogether too slight to show the curiously mixed, but not unpleasing, *tout ensemble* of a building which exhibits externally a strange combination of Saracenic, Norman, Gothic and modern work. Two towers similar to those of the west end flank the east end of the Duomo, which terminates in a semi-circular apse. . . . Two lofty arches, seen in the sketch, span the street separating the Duomo from the Archbishop's palace, and correspond nearly with the width of the belfry tower, which forms part of the palace. A massive building, stretching north and south, forms the base of the tower, which rises from the northern end. The corners of the building terminate in angle turrets. The pinnacles of the tower above are, similarly to those of the four towers of the Duomo, very curious and unlike Gothic work. A tower has stood here from very early times, for it is recorded that when in 1169 the Palermitan insurgents pursued the Chancellor Stephen he took refuge in this tower, or its immediate predecessor.

CATHEDRAL SERIES.—ST. ASAPH: GENERAL EXTERIOR, FROM SOUTH-WEST CORNER, LOOKING NORTH-EAST.

ST. MARY'S, NOTTINGHAM.

ON Christmas Day the bronze doors by Mr. H. Wilson, which are the gift of Mr. Sydney Morse, as a memorial of his father, the late Canon Morse, who was vicar of the parish from 1864 until 1886, were formally opened in St. Mary's, Nottingham. The doors are in the south porch, which has already been restored in Canon Morse's memory. According to a description which has been prepared by the architect, the general intention has been to illustrate the life of Our Lord in its relation to the Virgin Mary (to whom the church is dedicated). "In the tympanum, enclosed within a vesica, the Holy Mother supports and cherishes the body of Christ, while in the spandrels, on either side, the gates of death and life are suggested; the Dove, typifying the Spirit, enters weary into the one and issues strong-winged from the other, thus symbolising the unending round of life and death." Each door consists of five panels, in relief, illustrating the life of Christ. On the left door the subjects are:—The Annunciation, the Visitation, the Nativity, the Epiphany, the Crucifixion. In this last the Cross is a branching vine, and at its foot "stand our first parents, conscious of the Fall, while the doves of peace and pardon hover overhead." The subjects of the panels on the right door are:—The Flight into Egypt, the Baptism in the Jordan, the Entry into Jerusalem, the three Marias at the Sepulchre, the Resurrection. In this panel the Saviour is shown emerging from the tomb, and, while still bound with the grave-clothes, the Spirit of Life in the form of a dove flies to His breast, and overhead the birds sing at the coming of the new dawn. The inscription, which divides the tympanum from the doors themselves, is, "In Loving Memory of Francis Morse, 1818-1886, Father, Pastor, Friend."

Jules Raeymaekers, a Belgian painter, who recently died in the village of Houffalize, in the north-east of the province of Luxembourg, has bequeathed his house in that place to the Government, together with an endowment, to be used as a residence for landscape painters who desire to study the scenery of the Ardennes. The residents will be chosen by the Belgian Royal Academy, and no painter will be allowed to live in the house for more than two years.

COTHELSTONE.

By the HON. J. DUTTON.

TOWARDS Bridgwater, at the foot of the Quantock Hills, are the interesting remains of the ancient manor-house of Cothelstone, formerly the seat of the STAWELS, but now turned into a farmhouse. The STAWELS had been settled in Somersetshire since the time of the Conquest: the first was ADAM DE STAWEL, who took his name from Stawell, in the parish of Moorlinch.

Sir JOHN STAWEL, the owner of Cothelstone at the time of the Great Rebellion, was a zealous adherent of his sovereign, and he paid for his loyalty by seeing his noble mansion despoiled and devastated, his woods felled and many of his estates sold. Lord CLARENDON wrote of him as "a gentleman of the largest estate that any man possessed in the West, who, from his very great affection for the person of the king and for the Government that was settled both in Church and State, engaged with singular courage both his own person and two sons in the most active part of the war, and had rendered himself as odious to Parliament as any man in that condition had done."

He lived to see the Restoration, and was one of the hundred knights who welcomed CHARLES II. at Charing Cross. There is a very fine monument with recumbent figures of him and his wife in Cothelstone Church, on which there is an epitaph recording his loyalty and sufferings for the king. His eldest son RALPH was created Lord STAWEL in 1683. The male line became

extinct in 1755 on the death of EDWARD, fourth Baron STAWEL, but his daughter MARY, who married the Right Hon. HENRY BILSON-LEGGE, was made Baroness STAWEL in her own right, and was succeeded by her son. He, however, died leaving only a daughter, and the title became again extinct. The representative of the family in the female line is the present Lord SHERBORNE.

One of the wings of the house was rebuilt and other parts restored in 1873, the original features of this singular Jacobean house being carefully preserved. The mullions of banister design dividing the windows and the twisted pillars of the entrance are very curious, and probably unique. The great stone arch of the gateway originally occupied a position on the road nearer to the house than where it now stands, and the inner gatehouse is an excellent and almost untouched example of Jacobean work.

Tradition says that Judge JEFFREYS hanged two men, Colonel BOVET and Mr. BLACKMORE, on the stone arch in front of Cothelstone House to avenge himself on Sir JOHN STAWEL, because, notwithstanding his being on the side of the king, he was so disgusted at Judge JEFFREYS's brutality in the Bloody Assizes that, though he was high sheriff, he would not go to meet him when he came to Taunton, nor would he speak to him, but turned his back on him when he saw him.

In Cothelstone Church there are two very fine monuments with recumbent figures of two of the STAWEL family and their wives, one of the time of EDWARD II. and the other the Sir JOHN STAWEL of whom mention has already been made.

COTHELSTONE MANOR-HOUSE.

OUTER GATEWAY, COTHELSTONE.

INNER GATEHOUSE, COTHELSTONE.

THE NATIONAL MEMORIAL TO QUEEN VICTORIA.

THE central hall of the Royal Academy is now occupied by a model of the design for the national memorial which is to be erected in front of Buckingham Palace. It will be executed in marble and bronze. The following description is given of it:—

The model is 8 feet high, and being on a one-tenth scale, represents a total height, from the base to the top, of 80 feet. The statue of the Queen, which, as she sits enthroned, is 13 feet high, is draped in robes of state. On her right is a group representing Justice, on her left Truth, and at her back Motherhood. Above the cornice of the upper pedestal are eagles with outstretched wings, emblematic of Dominion; and on either side are figures, on the right of Courage and on the left of Constancy, qualities which, with the others, bring about the triumph of Victory, surmounting the whole. Round the base are fully-treated ships' prows, two bearing trophies suggestive of the Army and Navy, and two fruits and flowers, suggestive of Commerce and Prosperity. On each side of the platform is a great fountain discharging down steps into a basin 160 feet long by 28 feet across. The fountain on the right typifies Power, with figures representing the Army and Navy; below them is a sea nymph. Corresponding with this *motif* of Power, there is on the other side Intelligence, with figures representing Science and Art; below them reclines a triton. On the retaining wall, which is 8 feet 6 inches high, are reliefs symbolical of the British people as Children of the Sea. Flanking the steps leading up to the central feature are lions with figures representing respectively Peace, Progress, Manufacture and Agriculture.

It is not clear from the model how the memorial will stand as regards the point of view of an ordinary spectator. There is no doubt the curved lines are pleasing. But in such a dreary place as that which will be the site of the memorial so large a basin and such an expanse of marble platforms will not be a cheering spectacle on a winter's day. The old rule in this country was to allow people to approach close to royal memorials. In the Albert Memorial, although it is of unusual size, there is a slight departure from what was usual. Abroad the same principle was adopted. There might be a wide space separating the allegorical figures at Versailles from the visitors, but the statues of Louis XIV. were not inaccessible to the crowd. In Berlin every inch of the famous memorial of FREDERICK THE GREAT can be closely studied. The recently erected memorials of the Kaiser WILLIAM reveal a new intention, and by the size of the work a spectator is made to feel his own insignificance. Before the memorial of Queen VICTORIA we expect the prevalent impression will be one of aloofness, for royalty will be unapproachable. The two great fountains will be barriers. In such works we suppose there must be allegorical figures and there is a large stock from which a sculptor can select. But in such a case it would seem to be necessary to suggest the sources from which the funds were derived for the creation of the memorial. If India and the Colonies contribute, why should they not have their representative figures? Then, again, is there not a little overdoing of Courage and Power? We can understand the fitness of the enraged lions which flank the Emperor WILLIAM's memorial in Berlin. Indeed, the number of wild animals and wilder women which are found there are almost enough to deter a peaceable man from studying the work. If a child from a Sunday school were to ask a teacher, after looking on Mr. Brock's figures, why are lions made the representatives of Peace, Progress, Manufacture and Agriculture, it would be found difficult to give an explanation. To ordinary folks they would appear to be embarrassments rather than auxiliaries. Besides, would not fewer figures, or those of a different class, become more suggestive of the relations between the late QUEEN and her subjects during sixty years?

THE MEMORIAL OF THE ETRICK SHEPHERD.

WHEN Walter Scott was appointed Sheriff—a position corresponding with an English judge of a County Court, it was necessary that he should frequently visit Ettrick Forest, which was part of his district. There he became acquainted with James Hogg, whose enthusiasm, says Lockhart, "about the minstrelsy of the Forest was equal to his own, and whose mother, then an aged woman, though she lived many years afterwards, was celebrated for having by heart several ballads in a more perfect form than any other inhabitant of the Vale of Ettrick." Hogg was enabled to furnish Scott with a number of copies of old ballads which subsequently appeared in the "Border Minstrelsy." About the same time Hogg published some of his original poems, and with the profits, together with the money received for a couple of prize essays, he was enabled to take a farm which turned out a failure. He was afterwards able to obtain one from the Duke of Buccleuch. But his mind was divided between pastoral

MEMORIAL OF JAMES HOGG, THE POET.
(A. G. Heiton, Architect.)

and literary pursuits, and for the greater part of his life he was in financial difficulties. That he was a true poet could not be questioned, but he was of a different school to Burns. It was truly said by John Wilson that Burns with a pen and Burns with a flail were identical; for as the thresher is never concealed, Burns was always revealing himself in his songs. Hogg, on the contrary, sought to be representative of other men. It seemed, too, as if fairy-land had been revealed to him when he was watching sheep as a boy, for his "Kilmeny" is unique. During his lifetime he was so general a favourite, and was so complacent and good-humoured that many people took advantage of him, and he was made to exhibit himself as if he were made up of foibles for the general amusement. He was utilised for the "Noctes Ambrosianæ," and was expected to be always setting tables in a roar. But there is no doubt he was capable of writing exquisite poetry, and under happier circumstances his reputation would be more extended. His countrymen have not forgotten his genius, and the site of the cottage in which he was born in 1772 has been marked by the memorial which we illustrate. It was designed by Mr. A. G. Heiton, architect, of Perth.

ST. MARY'S CATHEDRAL, EDINBURGH.

IN last September the congregation of St. Mary's Cathedral, Edinburgh, was able to celebrate the twenty-fifth anniversary of the dedication of the building. The opening of a new cathedral must necessarily be a rare event in this country, and there was a time in Scotland when it would appear to be an impossibility. It is owing to the generosity of two ladies, the Misses Barbara and Mary Walker, that the building is an ornament to Edinburgh. Originally their intention was to erect a "chapel" at a cost of 30,000*l.* It was afterward arranged

to expend a sum of 45,000*l.*, which was increased to 65,000*l.*, on a cathedral.

As there was a difference in ritual between the Established Churches in Scotland and England, it was supposed that if the competition were restricted to Scotsmen the designs might not be so well adapted for Episcopalian purposes as those obtained from English architects. The trustees, therefore, settled that there should be three Scottish as well as three English competitors. The choice fell on Mr. Alexander Ross, of Inverness; Mr. Lessels, of Edinburgh; Messrs. Peddie & Kinnear, of Edinburgh; Sir

ST. MARY'S CATHEDRAL, EDINBURGH. (SIR GEORGE GILBERT SCOTT, R.A., *Architect.*)

DESIGN FOR ST. MARY'S CATHEDRAL, EDINBURGH. (By GEORGE EDMUND STREET, R.A.)

DESIGN FOR ST. MARY'S CATHEDRAL, EDINBURGH. (By WILLIAM BURGESS.)

G. G. Scott, R.A., Mr. G. E. Street, R.A., and Mr. William Burges. In the instructions they received it was stated that sittings were to be provided in the nave and choir for 1,500 persons. Provision was also to be made for a small congregation at daily services. There was to be a chapter-house capable of holding 150 persons.

Speaking of the designs as a whole, the late Mr. Ewan Christian, who was appointed judge, in his report to the trustees, said:—"The care and skill which have been bestowed on the preparation of the respective designs, and the beauty of many of the drawings, is very remarkable, and it can hardly be doubted but that by judicious selection from amongst them you can scarcely fail in securing a building not only well calculated for the purpose in view, but one that shall be a noble addition to the ornamental structures of your city."

There was nothing mentioned in the instructions about the style to be adopted. In 1872 Gothic was considered to be the only appropriate style for ecclesiastical buildings. The examples which survive in Scotland of the old Episcopalian churches were all in that style. It is believed in the North that local Gothic has sufficient peculiarities to be recognised as a distinct variety. French influence is supposed to have had something to do with imparting character to it. The competitors found some difficulty in dealing with the subject. Mr. Ross said of his design:—"A severe and comparatively early style of French Gothic was selected, so as to avoid excessive detail and carving, and as approaching more nearly the best period of Scottish Gothic, which in much of its massive and severe character is more nearly allied to the early French than any other, and many details may be found identical in both." Messrs. Peddie & Kinnear stated:—"Scottish Gothic is quite distinct from English Gothic. There are noble examples of it in the cathedrals of Elgin and Dunblane, the abbey of Sweetheart, &c., buildings which owe their effect to the grandeur of their general design and the simplicity of their details, rather than to elaborate ornamentation and minute carving. It has been sought to make the cathedral, which, from its position and size, will be the cathedral of Scotland, thoroughly Scottish in character." Sir Gilbert Scott said:—"In selecting the variety of architecture on which to found my design I have met with some little difficulty. I desired that it should not, at the least, be discordant with the finest of the Scottish examples; but here we have an *embarras de richesses*, for we find in Scotland noble examples of nearly every period. Putting aside the Norman, we have glorious examples of the Transitional style, as at Kelso, Jedburgh, St. Andrews, parts of Holyrood, &c. We have the developed Early Pointed, as in the greater part of Holyrood, the whole of Glasgow, Elgin and many other grand examples; the earlier Decorated, as at Dunblane, Sweetheart Abbey, &c., and the later styles in very many others. I have myself, however, been most impressed by the earlier phase of the Early Pointed, a style which especially unites the architecture of Scotland with that of the North of England, and is one capable, as I think, of the greatest possible degree of dignity, united with a reasonable amount of simplicity and any amount of beauty." Mr. Street said:—"In choosing to limit my studies for this work to the Scotch churches of the thirteenth century, I am running no risk, for I believe that it would be difficult to find buildings more pure in detail, more graceful in design, or more suited to our wants in their comparatively modest scale in any part of Europe. The country which can boast of such examples as Glasgow, St. Andrews, Dunblane and Elgin cathedrals, or the abbeys of Pluscardine, Sweetheart and Dundrennan, Melrose, Kelso, Jedburgh, Dryburgh and Holyrood, has no need that her architects should leave their own country in search of what is most appropriate and most beautiful. All these buildings, with one exception, are of very nearly the same date—the first half of the thirteenth century, and it is in the style of this period accordingly I have made my design." Neither Mr. Lessels nor Mr. Burges described the process they adopted in the selection of a style.

Mr. Christian concluded that in arrangement of the ground plan Mr. Street's came first, and he added, "I do not think it would be possible to design a better or more suitable arrangement for the purpose in view." In respect of construction, the first place was assigned to the design by Mr. Ross, partly because vaulting was not employed in the loftier and larger portions of the church. For architectural character the designs by Mr. Ross and Mr. Burges were said to be "so beautiful in general design that it would be hard to balance their respective merits." On the whole, partly for constructive reasons and for general

solidity, Mr. Christian preferred the design of Mr. Ross. He said there was perhaps more general richness and picturesqueness of effect in Mr. Burges's design; the eastern and western fronts were richer and more beautiful, while the western front was a most finished and beautiful composition. Mr. Street's design was described as "one of great excellence in respect of detail, and although perhaps more severe in its general character than either of those first mentioned, yet it is wrought out in a bold and vigorous style, combined with much elegance, and would undoubtedly if executed produce externally a dignified and noble result, whilst the interior would be remarkably light and elegant." As regards Sir Gilbert Scott's design, it was said:—"The design is throughout bold and simple in its character externally, but internally decoration is more freely introduced. The most striking feature is undoubtedly the central tower, the massiveness and noble proportions of which would be of the greatest possible value on a site like that on which it is proposed to build in giving a general dignity of effect to the whole structure. The tower for this purpose is designed with very considerable power. Other portions of the exterior, and notably the western front, are much less happy and forcible; but the eastern end of the choir is a fine and dignified composition." Mr. Christian informed the trustees that their selection would have to be limited to one of the four designs he described. The advice was fatal to the designs by Messrs. Peddie & Kinnear and Mr. Lessels.

After Mr. Christian's report there was much surprise when it was announced that Sir Gilbert Scott obtained the commission. Mr. Street, in a letter to *The Architect*, wrote to say that he had taken part in very few competitions, and always acquiesced patiently in the finality of a decision when given by a fair tribunal, but he would not be tempted again. His reason was:—"If in the case of so important a building, where so much caution was shown in drawing up the conditions, and where so eminent a professional referee was called in, both the conditions and the referee's report are treated as so much waste-paper, it is to be feared that no precautions which architects can devise will give any reasonable certainty of a fair result." Mr. Christian also wrote to us saying that he could not agree with Mr. Street that the trustees were bound in such a case to exercise no power of selection, for "no body of deliberating men, and especially Scotchmen, could be expected to relinquish such a right, and no consulting architect in the presence of so many excellent designs could, in my judgment, ask them to do it." We also received a letter from one of the trustees, in which it was remarked that although they had the greatest confidence in Mr. Christian's judgment, there was an unanimous vote in favour of the acceptance of Sir Gilbert Scott's design. Some were at first in favour of the design by Mr. Ross, but "none considered that Mr. Street's design, with all its great merits and its exceeding beauty, would be suitable to the site without considerable modification, which would have been equivalent to a new design."

Afterwards it was stated that Mr. Ross had obtained the assistance of Mr. George Freeth Roper. Mr. Ross promptly denied this, and declared that "the designs were prepared by myself and worked out in detail in my own office here, under my own direction and superintendence by regularly paid draughtsmen, who, except one (Mr. Roper) were young men trained in my own office." The view taken in our columns of the unpleasant subject by Mr. Edmund Sharpe, who, it may be mentioned, preferred Mr. Street's design, was that "it is not possible in this or in any other age for an architect in large practice either to execute himself a fifth part of the drawings that pass out of his office, or to do more, often, than to pass most of them in hasty review." But he hoped the incident would have a beneficial effect in checking the tendency to employ hired assistants in the preparation of competition designs—of draughtsmen who had been brought up at the feet of teachers of a different class, and whose ideas might be foreign to those of their temporary employer.

There can be no question that the competition brought forth three excellent designs, which we republish in connection with the recent celebration, and especially on account of their intrinsic interest as examples of the work of three renowned English architects.

The Manchester City Art Gallery committee have resolved that it is desirable that an exhibition of the works of the late G. F. Watts, R.A., should be held in the City Galleries in the approaching spring.

FRENCH SCHOOLS OF ART.

A DEPUTATION consisting of the chairman, Mr. James Fleming, with two others of the Governors, Mr. W. Forrest Salmon, F.R.I.B.A., and Mr. John J. Burnet, A.R.S.A., F.R.I.B.A., and the headmaster, Mr. Fra. H. Newbery, were appointed, at a meeting of the Governors of the Glasgow School of Art, to visit and report upon the working of some of the more important of the national and municipal schools of art in France. They were further charged with the mission of obtaining, if possible, the services of a professor for the department of design and decorative art in the school. In this latter commission they were successful. The Chairman and the Governors, whose names are given above, travelled at their own expense; the headmaster alone received a grant from the school funds to cover his outlay.

The schools visited were the Ecole Nationale de Beaux-Arts in Lyons; the Ecole Nationale et Spéciale of Paris; l'Ecole des Arts Décoratifs in Paris; l'Ecole Nationale des Arts Industriels at Roubaix, and l'Ecole Municipale des Beaux-Arts at Lille. It was not found possible, as at first intended, to visit the School of Art at Toulouse. The proposed visit of the deputation had been notified by the Minister of Public Instruction in France to the directors of the schools in Lyons, Paris and Roubaix, and the Prefect of the Nord was instructed to notify the Mayor of Lille. These most useful introductions were obtained through the French ambassador in London, M. Cambon, by the kind action of the Scotch Education Department. The following remarks relate to the Paris schools:—

In Paris the deputation visited (1) the Ecole Nationale et Spéciale des Beaux-Arts; (2) the Ecole Nationale des Arts Décoratifs; (3) the Palais du Trocadéro, to purchase casts for the school.

(1) The Ecole des Beaux-Arts, Rue Bonaparte. This institution is practically the university of art, not only for France (although the educational facilities there afforded are primarily for Frenchmen), but of the whole world. All nationalities are represented on the roll of students. French students, sent as they are as bursars by practically every city and town in France, form by far the majority, and among other countries contributing students perhaps America sends the most. Male and female students are alike eligible for admission. Instruction throughout is free, and there is no registration fee. No students above twenty-five years of age are admitted. Entrance examinations are held twice yearly, and these are very exacting. From painter, sculptor, architect and engraver candidates alike, admission work is demanded. Should this gain acceptance, other proofs follow to be executed before the candidate is permitted to be enrolled. Thus painting students submit a drawing from the life and a drawing from the antique. These being accepted, the candidate has further to execute and submit:—(1) An anatomical drawing (two hours allowed); (2) a perspective drawing of an object in relief showing principal perspective lines (four hours); (3) an antique fragment, modelled (nine hours); (4) a study in elementary architecture (six hours); (5) an examination in general history (written or oral at choice of candidate).

Sculpture and engraver candidates have to pass a similar test, differing only from the above in that preliminary modelling works are submitted, and drawing from the antique takes the place of (3) above.

Architect candidates have to submit to, instead of submitting, a test of their powers of design, and have further to execute a work in drawing from the antique and ornament; modelling; calculations and logarithms; arithmetic; algebra and elementary geometry; descriptive geometry applied to architecture; descriptive geometry; oral proofs of history knowledge and a written composition.

The Ecole des Beaux-Arts is directly controlled from the Ministry of Public Instruction of the Fine Arts. The teaching administration is vested in a director and the body of professors known as the Superior Council. The official business is conducted by a secretary and staff. The subjects taught are drawing, painting, sculpture, architecture and engraving. The subject of engraving in copper is attached to the painting section, and to sculpture belongs that of engraving on medals and precious stones. There is no section for decorative art, as commonly understood, nor does design for the manufactures form part of the curriculum.

M. Henri Mayeux, architect, gives an annual course of lectures on the decorative arts to students of the Ecole Nationale et Spéciale des Beaux-Arts.

There are three ateliers for painting, three for modelling and three for architecture. Each atelier receives visits from a professor three times weekly between the hours of eight and twelve. Lectures are given at hours in the day other than these. A week of twenty-four hours is the time generally allowed for each study in painting and modelling. The sizes of works are rigidly fixed, and these are, as a rule, small. Larger studies are allowed for the annual competitions.

The teaching comprises courses of study, exercises set by the professors, examinations and competitions. There are eighteen distinct courses of study, and the programme for these courses is determined by the Superior Council of the school and approved of by the Minister. The whole system of teaching and study is based upon examinations for awards, competitions for prizes, and the submission of specified work for prizes and bursaries. All judgments are made by juries special to each section of school work. These juries are chosen by the professors among themselves. The Director is president of all juries and an official inspector acts as secretary. Marks are awarded upon the basis of a fixed official value. There is an annual exhibition following upon the completion of the work of the juries. Students are encouraged to take all branches of art study. Certificates of study are issued to painters and sculptors.

The architectural school is divided into first and second courses. A diploma of architecture is granted to students who successfully complete the work of these two courses.

Besides the Grand Prix de Rome, belonging to the Institut de France and entitling the winner to a four years' residence at the Villa Medici or French State art school in Rome, the school is very rich in gifts and legacies. These are granted generally for special studies in the three arts respectively, as also for anatomy, history, perspective, and in each case are distinguished by the name of the donor.

The Foundation Chenavard is specially for poor students, and is divided among painters, sculptors, architects and graveurs. The number of foundationers, as also the value of each respective bursary, is determined by the School Council. The Société Centrale des Architectes Français appears as a donor, and a prize is given by American architects educated in the school. These gifts and legacies are outside the prizes and medals offered by the school itself.

In connection with the school there are:—(1) A museum of casts (all styles and periods); (2) a museum of copies of pictures of the Old Masters; (3) works that have obtained the Prix de Rome; (4) a collection of works that have obtained medals; (5) material for study of anatomy, geometry, stereotomy, physics, chemistry and construction; (6) objects of art given or bequeathed to the school; (7) library.

The deputation visited an atelier for architecture, Professor Paulin; painting ateliers taught by Professor Gérôme (the late) and Professor Cormon, and ateliers for modelling presided over by Professor Barrias and Professor Chaplain. Order and discipline is maintained in the ateliers by a body of surveillants. A visit was also paid to the female painting and drawing studio. In each studio the macier or senior student in charge, and who is elected to the post by his fellows, courteously gave any information that was asked for as to the work and working of the studio, and the deputation had further the pleasure of a short interview with Professor Cormon.

The Ecole Nationale des Arts Décoratifs in the Rue de l'Ecole de Médecine is, as its sub-title implies, a school for the application of fine arts to industry. The institution is housed in a building formerly a school belonging to a religious order. Its classes are open day and evening. Students under thirteen are not admitted to the day classes, nor under fourteen to the evening courses.

Candidates for admission submit either a study of ornament in light and shade, a modelled study or an exercise in architecture, according as they wish to be enrolled in either one of the courses of drawing, modelling or architecture. Should any one of these proofs be considered worthy, the candidate is admitted at once to the superior division of the course. Any student admitted into one particular section can at the same time attend two other sections, as room permits. The hours are from 8.30 A.M. till 10.30 A.M., 1 till 4 P.M. or 1 till 5 P.M. according to the season, and from 7.30 till 9.30 P.M. Unjustifiable absences render the student liable to dismissal and the same punishment is made to students whose work is considered inefficient or insufficient. All instruction is free.

The subjects taken are drawing, modelling, geometry, plant study, architecture, mathematics, ornament and architectural composition, history of art, perspective and anatomy. There are special studios for ornament applied to industry (painted and modelled), as also a special atelier for architecture. In the absence of the director the deputation was shown over the building by the sub-director, and various studies in process of execution were shown. Gas and coke fire are used for lighting and warmth. The authorities are considering the removal of the school to other and more suitable premises. Notwithstanding the adverse circumstances under which the work is carried on, the school has turned out some very notable decorative artists. Its influence, however, is most felt in the general excellence of the workmen it supplies to the various artistic industries of Paris and of France.

At the Museum of Architectural Casts installed in the Palais du Trocadéro the Governors ordered a collection of casts for the use of the Glasgow school. These consisted of figures from the Porte Royale of the cathedral of Chartres; Corbeil, a complete doorway from Toulouse, Barye's Lion and Serpent and other smaller specimens.

In France education is free, but no student may enter a school of art until he has passed an entrance examination. This examination demands preparatory instruction, which is provided for in special preparatory schools. The entrance examination is such that candidates applying must exhibit both skill and earnest endeavour in order to obtain a pass. The ordinary French student is compelled to follow a definite and rigorous course of training, which insures a thoroughness that has not as yet been possible to reach in Scotland. One of the reasons for this is that art education is felt everywhere in France to be an absolute necessity. It is encouraged alike by the State, by the civic authorities and by the manufacturers.

The gratuitous instruction that everywhere prevails may partly account for the organisation and methods to be found in the French schools. The French people take art and art instruction much more seriously than is the case in Scotland.

In all the schools the discipline was maintained by a special class of men called "surveillants." The work begins at 8 A.M., and the classes are, with few exceptions, all held during the day. The artisan student receives his instruction in district evening classes, and the central school is reserved for students intending to devote their lives to the profession of art.

The deputation feel they have got much useful and practical good from their visit, and have gained an experience of work and methods which should be of great service to the Glasgow School of Art. It is hoped that by the aid of the continuation classes of the School Board and by the establishment at some early date of a preparatory school the thorough preparation of students for the Glasgow School of Art may be insured. The accommodation for work afforded by the Glasgow School of Art compares favourably in many respects with that existing in the French schools. The general excellence of the work of the Glasgow School of Art in drawing and painting will bear comparison with that produced by the continental schools, but in architecture, advanced design and figure composition there remains much to be accomplished in Glasgow.

THE ART INSTINCT.

A LECTURE by Mr. J. B. Yeats, R.H.A., was delivered in the Royal Hibernian Academy, Dublin, on "The Art Instinct."

The lecturer, in the course of his remarks, said that in Dublin the artist had to bear his cross meekly amidst much scornful criticism. He deplored the absence of a modern art gallery in Dublin, where there were schools of divinity, engineering, classics and science. There was, of course, a National Gallery, and all honour to it, but in it nothing modern could be seen. The modern painter was the magician who unlocked ancient art. One of the reasons why Dubliners did not care about pictures was that they themselves were naturally noisy, and as pictures were for silent people they in Dublin could not put their minds to this silent study. There was no peace like that of the gallery of the Old Masters. The silence of a Roman Catholic church was immensely enhanced by the silence of holy pictures. There was another reason why paintings got such scant favour in Dublin; pictures had been called the poor man's books, but as Dublin was a university city

they did not appreciate them. People talked so much about truth and made such a brag about it that they became dupes to their own words, but the sober fact was that no one sought truth. The man who saw facts as they were would be sad and disappointed. In this great business of artificial illusion people could delightfully deceive themselves. The art instinct was like a Divine voice, which summoned out of the void innumerable worlds. Portrait-painters were the true chroniclers of history, and when the historians of the future required to know their heroes it was to the portrait and not to the photograph they would go. The true connoisseur liked natural beauty and that which forced him to reflect. It was a common idea that the artist who painted what was beautiful was the only artist worthy of the name. Poets were allowed to please themselves with what was ugly—Shakespeare gave us "Falstaff" and Homer contributed his type—but artists must restrict themselves to beauty. To paint pretty faces had become a profitable industry with English artists. These artists had stamped their faces with insipidity, he supposed, lest they should alarm their patrons. Mr. George Moore had called Millet a sentimentalist, but he (the lecturer) thought Millet not to be a sentimentalist, but the chief of sympathetic painters. Artists regarded the sentimental painter as the black sheep of their flock, and it was not because he falsified facts, but because he painted without connection and against connection. In a painting all its merits lay in the way it was painted and not in the subject, yet the subject was of great importance, since everything depended on the degree to which the painter was moved to exert himself. Referring to Sargeant and Millet, Mr. Yeats said the former was the greater painter, but Millet was invariably the greater artist. The lecturer then drew attention to a picture, "The Beheading of St. John," and said the Protestant mind demanded literalness in its religion as in everything else—it must have the literalness of the counting-house, the ledger and the police-court. This was not so with the Catholic taste at all, as the Catholic religion was like the prayer of Dante, and that was the point of view he (Mr. Yeats) most liked. In conclusion the lecturer referred to France as being the motherland of all artists, no matter of what nationality. In her they had their own friends and relatives, but here in Ireland they were strangers, little better than foundlings.

BOYLE ABBEY.

IN their last annual report the Commissioners of Public Works in Ireland refer to the works of preservation and repair which have been carried out at Boyle Abbey, co. Roscommon. The Cistercian abbey of Boyle was founded in 1161, and was finally completed in 1218. It was an affiliation of Mellifont Abbey, founded in 1142. Maurice O'Duffy was the first abbot of Boyle; it was dedicated to the Blessed Virgin Mary for the monks of the Cistercian Order, first introduced to Ireland at Mellifont by Malachy, Bishop of Armagh. The abbey was endowed by the MacDermots, one of whom, Cornelius MacDermot, died there, and was buried in the abbey in 1197. He was king or chieftain of Moylurg, which territory is nearly coterminous with the present barony of Boyle. The structure passed through a series of vicissitudes and suffered greatly at various times. In 1235 the forces of the Lord Justice Maurice Fitzgerald encamped within its walls, and it was again pillaged in 1315. In 1569 it was granted to Patrick Cusack, of Gerardstown, co. Meath, and again in 1589 to William Usher. In 1595 it was besieged by the Earl of Tyrone, and in 1603 it was given to Sir John King, ancestor of the Earl of Kingston and Viscount Lorton, eventually coming into possession of the late Colonel King-Harman, by whose successor it was vested in the Board as a national monument. During the military occupation from 1599 to the end of the eighteenth century, when the monastery was known as Boyle Castle, the chapter-room walls on the east side were removed or had fallen, and a new range of buildings utilising the west wall of the chapter-room was erected in the cloister garth. The soldiers filled up the southern and eastern cloister walks with *débris* to about the level of the kitchen floor, and formed windows to suit their requirements. They also made a flagged passage, level with the kitchen floor, along the southern cloister walk. From this passage they entered the long range of new buildings on the eastern side of the quadrangle and the refectory on the southern side.

The ruins were repaired by the Board in 1894, but the

greater part of the ivy which covered the walls, including the tower and east gable, had not been removed. During the past year the ivy roots had grown to such dimensions as to become dangerous to the safety of the structure, and it was necessary to remove the ivy and repair the walls where the masonry had been dislocated by the large roots growing out of the walls. Shrubs and saplings were growing amongst the ivy in profusion. The tops of the walls throughout were cleaned down and concreted, the floors over the chapels and chancel repaired and made good, a concrete floor on the bell-loft at the west end was laid, the clerestory windows were made secure, and the defective joints in the masonry throughout stopped with concrete to prevent wet entering the walls. The loose masonry of the four buttresses at the northern wall of the nave was taken down and rebuilt with concrete, and they were carried up several feet higher in order to support the top of the nave wall, which was leaning over.

The removal of the ivy from the eastern gable of the church revealed the jambs and arches of the three early Pointed windows which lighted the chancel, and also disclosed the series of horizontal string-courses carried across the gable, which, though quite unmeaning in connection with the early Pointed windows, would be a fitting adjunct to windows of the roundheaded Romanesque type, such as are in the transept adjoining. These strings across the gable go to prove that the present east windows are not part of the original design, but are later insertions, and that the original windows were Romanesque of the twelfth century, such as are still to be seen in the Cistercian House of Abbey Knockmoy, co. Galway, and similar to those which formerly existed at Jerpoint Abbey, co. Kilkenny, before the fourteenth-century tracery window was inserted in the east gable of that church.

TESSERÆ.

"The Good Shepherd" Mosaic, Ravenna.

THE masterpiece among all the mosaics in the Orthodox Baptistery of Ravenna—if, indeed, it may not claim supremacy over all the works of the mosaic art since the time of Constantine that have come down to us—is the picture of the Good Shepherd, above the entrance at the end of the lower limb. In every sense it is a remarkable work. In drawing and in beauty of composition it rivals the best wall paintings found at Pompeii. It may, with a fair degree of probability, be considered the earliest pictorial representation of the Saviour. It marks distinctly the religious development or change which, at the time when the Pagan religion was still a living creed, unconsciously influenced the artist to merge and lose the milder glories of Apollo in his representation of the divinity of the Son of Man. The direction of the Christian sentiment of the time is also shown in the Saviour being depicted as He whom all could seek, instead of the inexorable Judge, represented in not much later works, who required to be entreated through others. It is one of the most noticeable characteristics of the many pictures of the Saviour at Ravenna that, almost without exception, He is represented in the flower of youth. It is easy to understand how the legend arose according to which a hermit was told in a dream that at Ravenna he could see depicted the veritable presence of the Son of God. At first sight this picture in the Mausoleum looks like a lovely rendering of the youthful Apollo or of Orpheus, but it is only necessary to dismiss all classic recollections to recognise nothing but the art production of a mind fully impressed with the inexhaustible love of the Good Shepherd for His sheep. Anything more purely classic in art, imbued with the deepest sentiment of the Christian religion, it would be difficult to imagine.

Gothic Architects and Irregular Sites.

Mediæval architects nearly always erected their buildings upon the ground just in the state in which they found it, and did not go to the trouble and often unnecessary expense of levelling it. One of the grandest examples of the way in which Mediæval architects treated a thoroughly unlevel site is the great abbey of Mont St. Michel in Normandy. Here all the buildings are made to fit into the irregularities of the great granite rock; each crag is made to form the foundation of some buttress or projecting turret, and each hollow forms a crypt. On the summit of the vast granite cone stands the magnificent apse of the abbey church surrounded by a forest of pinnacles; so grand and striking is the whole mass, and so inseparably united

are the buildings and the rock upon which they stand, that it is difficult to distinguish where the work of nature ends and that of man begins. Another grand example of the same kind of treatment is the cathedral and surrounding buildings at Limburg, on the Lahn. Here the size of the cathedral is very circumscribed, owing to the small space at the top of the rock upon which it stands, but in order to give dignity and grandeur to the whole group the beautiful church is crowned by seven spires, the one capping the central lantern rising far above all the others. At a distance both Mont St. Michel and Limburg bear a striking resemblance to some great dolomite rock. In each case the peculiarities of the site are strongly accentuated and exaggerated by the buildings erected upon them, and both look far steeper rocks when crowned by their beautiful churches than they would without them. In England the castle and cathedral of Durham are splendid examples, and must have been still more so when the western towers of that cathedral were crowned with spires. In treating one of these grand hill sites the Mediæval men carefully avoided anything that would have the effect of marking the junction of the hill or rock with the building placed upon it. They very rarely used terraces, and when they did use them they reproduced or continued the vertical lines of the building below the terrace, so that at a little distance the terrace looked like a part of the building.

Later Greek Vases.

On the Greek fictile vases belonging to the period of decline (ranging from about B.C. 330 to B.C. 100, or later) the figures are generally painted in red, or opaque white on a black ground, the details being picked out in crimson or yellow; gold is used occasionally in accessories. On some few vases we find figures and objects painted in their natural colours, and occasionally there is an attempt to represent those colours not absolutely as in the older polychrome art, but in their true gradations, as modified by light. This innovation, however, is hardly ever consistently maintained throughout a design; figures painted in the old conventional manner, without local colour or chiaroscuro, being strangely combined in the same composition with figures and objects rendered in their natural colours. Wreaths and other details are sometimes raised and gilt, and on a few vases some or all of the figures are in relief. The drawing in the earlier specimens of this style is very free and masterly, but with a tendency to mannerism and theatrical exaggeration. In the latter specimens the forms are effeminate or clumsy, the drawing coarse and careless. The compositions present a marked contrast to the severe simplicity which characterises the finest period of Greek ceramography; complicated and difficult foreshortenings are sometimes attempted; the face, which in the earlier style is almost always drawn in profile, is frequently given in front view, and an attempt is made to impart more expression to the features. The scene is no longer rigidly confined to one plane, as in the earlier period; there is often a rude attempt to indicate a landscape background, but without any application of aerial perspective. The compositions are often crowded, and sprawl over the surface of the vase, instead of being carefully adapted to its shape, as in the earlier style; and in many instances we meet with designs more suitable for mural or easel pictures than for the decoration of the convex or concave surfaces of vases. This change of style in ceramography was doubtless caused by the desire of the artist to reproduce on vases the refinement of colour and chiaroscuro which had been attained in the mural and easel pictures of Apollodorus and other great masters; but this attempt failed on account of the limited technical means which fictile art had at its disposal, and these ambitious innovations gradually led to its degradation and extinction. Very large vases were made in this period, especially in Southern Italy, and these do not seem to have been intended for domestic use, but rather for the decoration of the houses of the rich. But the finest of these ornamental vases cannot be compared for beauty of form and perfection of material and fabric with the fictile art of Nola and Vulci in its best period; the clay is thicker and heavier, and the black varnish which forms the ground less lustrous and less durable. A large proportion of the designs relates to Dionysiac subjects, to Aphrodite and Eros, or to sepulchral rites. It is probable that some of these subjects relate to the Dionysiac or Eleusinian mysteries; but as the names of the figures represented are seldom inscribed on vases of this period, it is often difficult to ascertain the import of these compositions.

The Reformation and English Architecture.

The Reformation brought about a disposition to break with precedent, to adopt change and to welcome novelty. In the preceding times men were content to follow in the footsteps of their immediate predecessors; they were accustomed to take their architecture, as they did their religion, on trust; gradual alterations of detail might be allowed in either, but in no case could any radical change be permitted. The effect of this spirit may be witnessed in almost any of our great historical churches, in which may be traced with precision the modification of mouldings, tracery and sculpture, that mark the successive phases of Mediæval art, so clearly as to enable us to fix without difficulty the dates of the erection of each portion of such buildings. The clergy, being the great church builders of the time, were the keepers and preservers of architectural traditions. A certain uniformity of plan and proportion was maintained, subject, of course, to limitations, due to local or peculiar circumstances in certain cases. The workmen knew only the forms of art which they saw around them, and were therefore ready to submit to the authority which claimed their obedience. Originality was not sought for its own sake, and the whole progress of architecture resembled the gradual growth of natural objects. The change which came with the Reformation broke with all this. It was not only a change in the forms or even in the essentials of religion. It was a great uprising of the human intellect, demanding reasons where formerly it was contented with commands. Can we wonder if a revolution such as this has left its mark on architecture? It led, naturally, first to an indifference towards the old forms of Mediæval art, and then to a hatred and contempt for all that seemed to speak of a yoke that had been once broken, never again to be imposed. Such feelings soon manifested their destructive tendencies, and the spirit of iconoclasm was let loose. Destruction and demolition followed in its wake. Fortunately for us in this country, the native moderation and prudence of the English people prevented the occurrence of extravagance on the scale witnessed elsewhere, and their conservative instincts were readily enlisted on the side of preservation after the first whirlwinds of enthusiasm had somewhat spent their fire.

GENERAL.

The King has graciously consented to lend the International Society of Sculptors, Painters and Gravers his collection of 150 etchings from the royal library at Windsor for the Whistler Memorial Exhibition.

The President of the French Republic has specially authorised the picture of "My Mother's Portrait," now in the Luxembourg Gallery, Paris, to be exhibited in the Whistler Memorial Exhibition, to be held in the New Gallery, Regent Street, London, from February 21 to March 31.

The Liverpool Corporation Library in William Brown Street is to be enlarged at a cost of about 90,000*l.* by the erection of a room for the accommodation of the Hornby bequest.

Mr. W. E. Willink, architect, Liverpool, having been appointed to act as assessor of plans to be received in competition for the Carnegie Free Library, Wrexham, has received the approval of the Council for his scheme for submission to the competing architects. The site selected will be 682 square yards, with a frontage of 67 feet, an average depth of about 80 feet, and affording library building area of 54 feet by 60 feet.

An Exhibition of Paintings in oils and water-colours of India by Mr. R. Gwelo Goodman will be opened on Saturday next at the Leicester Galleries, Leicester Square. This collection should be of considerable interest to the large number of Anglo-Indians resident in this country, as Mr. Goodman has spent many years in the East and has obtained a particular knowledge of the atmospheric effects of the Orient. Colonel Sir Francis Younghusband has consented to write an introduction to the catalogue of this exhibition.

The Chancel of Brighton parish church is to be rebuilt from the designs of Mr. J. T. Micklethwaite, at a cost of between 5,000*l.* and 6,000*l.*

Alterations are in progress at the Aberdeen Art Gallery. A sum of about 2,000*l.* has been subscribed by the citizens and friends for casts for the equipment of the gallery. The committee have accepted a bequest of six pictures bequeathed under the will of the late W. A. Sandby, of Windsor.

The Royal Scottish Academy of Painting, Sculpture and Architecture have fixed as their receiving day for works, Monday next. Works in sculpture will be received on January 20.

Mr. Justice Grantham has sent a donation of 100*l.* to the Southwark Diocese fund as an expression of his thankfulness for the support given him by all classes in his recent action with regard to cottage housing.

Lady Elcho has presented to All Saints Church, Evesham, what is believed to be the old processional cross of Evesham Abbey, which is of fourteenth-century workmanship.

The Belfast Harbour Board have appointed Mr. Redfern Kelly to be chief engineer to the Commissioners in place of the late Mr. Giles.

Count Walsingham's House at Reading is in course of demolition to make room for business premises. According to tradition, Queen Elizabeth stayed here as the guest of Count Walsingham. Some efforts were made by local antiquaries to save this Elizabethan building from destruction, but without success. It was almost the only relic of ancient Reading, besides the abbey ruins and the old churches.

The Church History Exhibition will be held at St. Albans from June 27 to July 8. Sub-committees have been formed to deal with church plate, church furniture, church paintings, vestments and brasses, manuscripts or printed matter and pictures illustrating the most striking epochs in Church history.

The Board of Directors of the American National Episcopal Cathedral at St. Albans, Washington, have selected the Gothic style for the new buildings that will soon be erected. The first of these will be the choir building, situated on a part of the cathedral close already selected. It will cost 100,000 dollars.

The Villa which Napoleon occupied at Porto Ferrajo, in the isle of Elba, from May 1814 until February 1815, is to be offered for sale.

The Autumn Exhibition in the Manchester Art Gallery was visited by 87,000 people. Thirteen works have been sold for 953*l.* 19*s.* Last year the sales amounted to 829*l.* 9*s.*

The Liverpool School of Architecture and Applied Art (connected with the University) reopened for the Lent term on Wednesday in both the day and evening classes. The studios have to be divided at present, the modelling classes being carried on at the University, while the drawing, painting, design, metal and woodcarving classes are held in specially fitted studios at 5 Myrtle Street. The metal classes include practical work in brass and copper, enamelling and wrought-iron. A special feature of these classes is the reduction in fees offered to artisans, thus enabling them to obtain advanced instruction in the various handicrafts allied to architecture, especially modelling, woodcarving and wrought-iron work.

The Society of Beaux-Arts Architects in New York announce that a free course of study has been established, open to draughtsmen and students of any city modelled on the general plan pursued at the Ecole des Beaux-Arts in Paris, and comprising frequent problems in orders, design, archæology, &c.

Mr. Brock's statue of the late Lord Russell of Killowen, Lord Chief Justice, which the Earl of Halsbury is to unveil on the opening day of the ensuing term, is now placed in position at the Royal Courts of Justice.

Ayr Auld Brig has been restored to the condition in which it stood prior to the slight damage sustained by the structure, and the washing out of part of its temporary wooden supports by the flood of last month, with the exception that the bed of the river has been scoured out to a considerably greater depth between the piers. Mr. D. Kirkland, the contractor, in whose hands the temporary supporting works still are, has restored the wooden supports washed out; and Mr. Young, the burgh surveyor, has restored with concrete the large slice torn out of the north side of the foundation of the north pier. In the meantime the Town Council have under consideration the question as to how the legacy of 10,000*l.* or 11,000*l.* left and now available for the "rebuilding" of the bridge is to be applied, the decision to be come to being whether the structure should be repaired if that is possible, whether it should be partly rebuilt, or whether it should be wholly rebuilt, using for reconstruction all the visible stones of the bridge.

The Architect.

THE WEEK.

DURING many years Berlin possessed a reputation for its iron castings. They could be obtained of all sizes, from colossal war trophies to ladies' brooches. They were so sharply executed it seemed impossible that time could have any effect upon the surface. When that noble philosopher, JOHANN-GOTTLIEB FICHTE, died on January 27, 1814, no material seemed more appropriate for his monument than cast-iron. In the struggle against NAPOLEON he had inspired the people with enthusiasm through his addresses and university lectures. Although he was not a native of Berlin, he had taught in its new university, and, indeed, a man of his class could not be said to belong to any of the separate States. He was buried in the Old Dorotheerstadt Cemetery, and a tall cast-iron obelisk was erected to mark the grave, with the inscription, "The Teachers shall shine as the brightness of the firmament, and they that turn many to righteousness as the stars for ever and ever." The condition of the obelisk at the present time does not testify either to the endurance of cast-iron or the admiration for FICHTE. No doubt, in common with all philosophies, his system has been supplanted. But the earnest man who laboured so hard during the War of Liberation is deserving of longer recognition. It may be mentioned that in the same cemetery are buried SCHINKEL and STÜLER, the architects, and RAUCH, the sculptor.

In the neighbourhood of Saumur is a great rude stone monument known as the Dolmen of Bragneux. A description of it, furnished by the Rev. J. E. SOMERVILLE, was read at the meeting of the Scottish Society of Antiquaries on Monday. This dolmen, or chamber constructed of immense slabs placed erect in the ground and close together, forming the walls and supporting other great slabs laid across as a roof, is the largest in Europe, and is situated a short distance to the south of the town of Saumur on the lower Loire in France. Its megalithic structure is 65 feet in length, 24 feet in width and 15 feet in height. The whole consists of fifteen stones, of which four compose each side, one closes in the back, one partially closes the front, four form the roof, and one in the interior supports the largest of the roof-stones, which is split. The largest roof-stone is 24 feet in length, 22 feet 9 inches in width and nearly 3 feet in thickness. The stones which formerly made a passage leading up to the chamber were demolished and broken up for road metal when the neighbouring road was made. The dolmens of France are chiefly found to the west of a line drawn from the Mediterranean through Nîmes and Auvergne, sloping westwards to Bretagne; and on the east of this line circles and barrows are the common form of sepulchral monuments. Articles on the French prehistoric monuments written by the late Professor ROGER SMITH appeared some years ago in *The Architect*. In one case where the stones were ornamented by curling lines he suggested they were intended to recall the waves of the ocean. There is, however, he said, a veil of mystery over these objects which has not yet been lifted. By whom, and when, and for whom was all this done, and what does all this mean?

SIGNBOARDS are an essential in business, but care should be taken that they are not fatal or injurious to the people they are intended to attract. A woman was killed last week in Derby by the fall of a stone which was overthrown by the swaying of a sign measuring about 10 feet by 5 feet. The building inspector said the by-laws ignored signboards, and the jury at the inquest on the woman added the following rider:—"That we are of opinion that these signs should not be allowed to be

erected without proper authority from the Corporation, and if the Corporation do not possess that authority we consider they ought to take steps to obtain it, for the protection and safety of the public and in order that such a case as this will not occur again." It is unnecessary to say that Derby does not stand alone in having insufficient power to deal with the danger. In the majority of towns signboards are beyond official control. The big board in Derby was not the proximate cause of the woman's death, and that makes the case more important, for it shows there is more risk than would arise from the fall of a piece of timber. The mainstay had rotted and the sign was controlled by only two wire guards. In a gale which arose the signboard moved in such a way as to act as a lever on the parapet wall and to loosen the stones. The victim might have escaped the signboard, even if it fell, but a piece of the coping was deadly.

It would be difficult to convince a Parisian that the Pont des Invalides is to bear the name of our English monarch. If a new bridge were to be erected it would be a compliment to England to call it after EDWARD VII., for that would be equivalent to what was done in the case of the neighbouring bridge, which is known as Pont Alexandre III. But the present bridge has been known as the Pont des Invalides since its erection half a century ago. The bridge, too, is not suggestive of permanency, and everybody desires that the friendliness between France and England shall be continuous. Paris is always eager to exemplify the latest forms of construction. When in 1828 it was resolved to have communication with the Esplanade of the Invalides it was decided that it should be a suspension bridge of one span. That system was not represented in Paris at the time. When tested after its completion it could not meet the official requirements, and had to be removed. It was then decided to erect another suspension bridge, but with three spans. On fête days and when there were military evolutions the bridge used to be crowded and alarms were excited. A catastrophe would have been fatal to the Imperial Government, and accordingly in 1854 the masonry bridge, which we now see was constructed. The foundations may have some defects, for in 1880 it was necessary to carry out extensive repairs. The centre pier has a figure of terrestrial victory on one side and of maritime victory on the other. The designs for the masonry bridge were prepared by MM. DE LA GALISSERIE and DARCEL.

THE heights of buildings in American cities depend upon the peculiarities of the authorities as representing the spirit of the population. The new Times Building in New York is 430 feet above the footings, the Ivins Building in Park Row is 386 feet above the footway, and there are many buildings over 300 feet in height. In Philadelphia the Land and Title Building has twenty-two storeys, and is 317 feet high. In Chicago the Fischer Building is 235 feet high. Boston is more restrained, for the Ames Building has no greater height than 186 feet. Apparently there is a strong desire among Bostonians to avoid competition with the builders of Babel in endeavouring to reach the sky. A Commission lately reported that legislation is urgently needed to keep buildings within limits. In one part of the city, where there are trades which need lofty buildings, it is proposed that the maximum height shall be 125 feet, while in another part, which is mainly residential, the height is not to exceed 80 feet. But the Commission would prefer a uniform height, for they say:—"We are so thoroughly convinced that a general and uniform limitation of buildings to a reasonable height is neither an injury to real-estate values nor a hindrance to the growth of the city, we should recommend a maximum limit for the entire city of 100 feet." A conclusion of that kind suggests there is no hustling for offices in Boston.

SWEDISH ARCHITECTURE.

A VARIETY of causes have combined to make Norway possess more interest for Englishmen than Sweden. In the first place, the influence of the ancient romances has to be considered. During several years English scholars have popularised the legends, and the climax was reached by WILLIAM MORRIS, who not only endeavoured to tell us all about the Wolfings and the Niblungs, but in his "Earthly Paradise" relates how "certain gentlemen and mariners of Norway" set sail to find that happy place, but came to a western land instead. Then the magnificent scenery could not fail to be an attraction in an age of tourists. The political economists also found conditions of life in Norway which were novel to them, and many reformers wished to introduce a similar system. The modern efforts to promote trade have, however, had the effect of drawing more attention than formerly to Sweden, which may be regarded as the dominant partner in the dual kingdom of the north. To a great extent Sweden will bear comparison with Switzerland. It is a country where patriotism prevails, but it is of a kind which inspires self-reliance. By utilising its resources Sweden is in a condition which is enough to excite the envy of larger States. Everything depends on industry, but the people also patronise the arts and literature, and it can be said that no department of knowledge is without native-born representatives.

That architecture should be so well exemplified is remarkable, because Christianity was not established until a comparatively late period, and prior to that event there is no reason to suppose that building received much attention. It is believed the King INGJALD, by fair means or foul, obtained supreme power in Svealand about A.D. 700, and that is accepted as the beginning of the kingdom of Sweden.

About A.D. 830 St. ANSGARIUS endeavoured to convert the Swedes to Christianity. But, as in Norway, considerable opposition was raised against the new doctrines, and it was not until 1248 that the Church in Sweden became fully recognised as a national institution and as united with the Roman Church. There are some small country churches which are supposed to date from the eleventh century. The church at Varnhem is prized as being the chief memorial of Romanesque architecture in Sweden. However, the most important structure of the period is the cathedral of Lund, which will sustain comparison with any of the Rhenish ecclesiastical edifices. Throughout Gotland there are buildings suggestive of all varieties of Gothic with the exception of the latest. The thirteenth century was productive in Sweden as in other parts of Europe, and a union of Romanesque and Gothic is claimed to be peculiar to the country and is known as the Gotland style.

The cathedral of Linköping was commenced during the Romanesque period, but the greater part is Gothic. The cathedral at Skara is another excellent Gothic building. But the chapel attached to St. Bridget's nunnery at Vadstena is genuine Gothic, though of a simple type. There are no capitals to the piers, but a plain moulding at the springing of the arches, and which also marks the termination of the ribs of the roof. The windows are long and narrow, and the tracery not intricate. Stone was generally used in preference to brick. Under German influence, however, brick architecture was largely employed in the southern part of the country. The cathedral of Uppsala, which is the most important ecclesiastical building in Sweden, is constructed partly of stone and partly of brick. It is supposed to have been derived from a French prototype. The design was obtained from ETIENNE BONNUEILL, and he took some part in carrying out the works. But as the erection was in progress for a couple of centuries there must have been other architects engaged, and this is confirmed by the inconsistencies to be seen in it. The cathedral is about 330 feet in length; it has two western towers with spires, and a lofty *fliche*.

Sweden is deficient in secular architecture of the Gothic period. The remains in Visby of the great town wall, with towers at intervals, are enough to suggest the importance of the place at an early time. The so-called Pharmacy has greatest interest as a relic. It is possible that the timber which abounds in the country was used in the erection of houses and civil buildings. But the material was not enduring. A wooden building known as the Ornässtugan, or house of ORNÄS, survives at Dalarne from the fifteenth century; it was a period of disturbance, and the building might be described as a very long blockhouse, the upper storey projecting widely over the lower part.

A new era began for Sweden with the appearance of GUSTAVUS VASA. He was born in 1496. In his youth he was a leader of the opposition against Denmark, which then exercised power over the country. He was able to obtain the independence of Sweden, and had it recognised as one of the European States. It was during his reign that OLAUS PETRI, one of LUTHER'S disciples, introduced the Reformation. One of the first acts of GUSTAVUS was to persuade the Riksdag to pass a resolution by which not only the administration of ecclesiastical affairs but the whole of the Church property was transferred to him. A great many monastic institutions were demolished in order to provide materials for castles which were erected by GUSTAVUS and his family. Some of the buildings which were then erected in that way are of great interest. Among them are Kalmar Castle, Gripsholm Castle and Vadstena Castle. The palace at Stockholm was the most important example of Swedish Renaissance. Unfortunately it was destroyed in 1697. At first it is believed the architects were Germans and Dutchmen. But afterwards a number of Swedish architects arose. In the secular buildings of the Renaissance period as well as in the churches particular attention was bestowed on the doorways, and the combination of architectural and sculptural forms in them is often pleasing. It is also characteristic of the time that as much notice was given to timber construction as in the Gothic period. The material was used in houses and in the belfries of churches.

Sweden had also its Baroque period. In the beginning of the seventeenth century both secular buildings and churches presented examples of it. Evidently German types were preferred. In the latter part of the seventeenth century preference was shown for models from France and Italy. The House of Nobles (Riddarhuset) in Stockholm, of which JEAN DE LA VALLÉE was architect, a building of two storeys with a basement with pilasters dividing the windows, is one example of seventeenth-century work. Others are the palace of OXENSTIERN, the Bank of Sweden and the cathedral of Kalmar, which are to be credited to the elder TESSIN. The well-known royal palace of Stockholm, by the younger TESSIN, suggests Italian influence. FERGUSON says that for simplicity and grandeur it stands unrivalled among European palaces, with the exception of the Farnese, in Rome. He adds:—"It is true the material here is only brick and plaster, but the parts are so large and so well balanced that we forget this defect, and it is crowned by a cornice so well proportioned to the mass below that the eye is charmed and the feelings satisfied from whatever point of view the palace is regarded."

We have not the space to show the connection between the architecture and the history of the country. Sweden was well adapted to be a nursery of military power, and for a long time it exercised control over the destinies of Europe. Every reader of romance remembers how the brave Major DALGETTY served as "lieutenant and ritt-master under that invincible monarch, the bulwark of the Protestant faith, the Lion of the North, the terror of Austria, GUSTAVUS THE VICTORIOUS." But the redoubtable soldier of fortune found that GUSTAVUS was not a liberal paymaster, and he testified to having seen whole regiments crying out "Gelt! Gelt!" The

compensation was found in the number of victories which were gained and the contributions which had to be levied, when the worthy DALGETTY did not fail, as he said, to lick his fingers as became a good cook. Much of the spoils of war was spent by the nobles in the construction of castles. They also received grants of land in Sweden, and before long the nobles had a monopoly of political power. CHARLES XII. made a reputation as a warrior, and VOLTAIRE considered him of so much importance that he wrote his life. But his death accomplished a great change in the constitution of Sweden. It was recognised that peace had its victories as well as war, and science, art and literature were encouraged. The unfortunate GUSTAVUS IV. thought that he also had to make a name as a conqueror, but his attempts excited the enmity of Russia and the loss of Finland. Finally he was deposed, and the French soldier, BERNADOTTE, ascended the throne.

It was not to be expected that in a period of commotion like the early part of the nineteenth century, which was marked by a change of dynasty, that much attention could be given to architecture or the other arts. Half the century had passed away before there was a revival of architecture. One of the first buildings erected was characteristic of the new aims of the country, for it was the technical high school in Stockholm. The architect was F. V. SCHOLANDER. Another of his designs was the synagogue in the capital. Although episcopacy is not recognised, the old cathedrals are respected and attention was bestowed on their restoration. Most of the work was entrusted to H. ZETTERVALL. Besides Romanesque and Gothic, he studied Renaissance examples and reintroduced a free Classic, which is now more practised than any other style. Of late years it might be said that the best modern works of all countries in Europe, as well as of the United States, are being used by Swedish architects to gain inspiration. Efforts have even been made at emancipation from older styles and to design buildings which will be examples of the application of rigorous logic. It is not peculiar to Sweden that its oldest works are derived from other countries, for neither Romanesque nor Gothic can be called a home growth. But by regarding Sweden and Norway as equal representatives of Scandinavian art, something is obtainable which may serve as the nucleus of a style. There are deep thinkers in Sweden, and both archæology and æsthetics have been considered. Early in the seventeenth century DALIN wrote about the principles of art, and he was followed by other authorities. Indeed, a number of writers have treated of the science of the beautiful. One most interesting work, "Roman Days," by the late VICTOR RYDBERG, was noticed in *The Architect* soon after its appearance. He delivered a great many lectures in the Private University at Stockholm about the theory of art, its origin and development. He has had several successors. In painting, sculpture and music, Swedish artists have been successful. Although it may seem likely that science will be more attractive than art in our time, yet there are enough inducements for Swedish artists to prefer the beautiful to the useful.

THE "YELLOW PERIL" IN ART.*

IT was not anticipated when the collections at South Kensington were first gathered that a time would come when handbooks relating to Chinese and Japanese objects would be necessary. They were supposed to be outside the pale of what was applicable in England. In art as in scholarship the Mediterranean exercised an influence of which connoisseurs were not always aware. The Phœnician traders at an early age made the products of Greece, Italy and Northern Africa familiar to

various parts of Europe. Occasionally examples by Persian and Assyrian craftsmen formed part of the merchandise. It is doubtful whether India came within the purview of the Phœnicians, and it is now difficult to decide whether Greece was indebted to India, or India to Greece, for some of its forms. China appears to have closed its gates against the most enterprising traders of antiquity, and whether the islands now known as Japan could have furnished objects which would be interesting to Europeans is a question which is not easily solved. All that can be said was that the Mediterranean was the great highway for transferring works of art, and countries which could not easily be connected with it were outside the current of affairs, or, in other words, of civilisation in the ordinary sense of the word. Afterwards systems of various kinds were established. But the East remained as much ignored by philosophers as by the earlier traders. The great books of India and of China display wonderful wisdom. But it was only in a recent time that Western Europe became aware of their existence. Some ornamental forms like the fret may have been derived from the Chinese, and there is much that is remarkable in the old work of India and Japan. But whenever art was looked on as a whole the products of a circumscribed area were alone taken into account. The Phœnician merchant determined the kind of productions which for centuries were to be accepted as beautiful. Chinese and Japanese pottery began later to be sought after by collectors, but the interest attached to the pieces was mainly due to the circumstance that they were so remote from what was accepted as true art by Europeans. Many years passed away before it was supposed that the ornamentation of the Chinese and Japanese could have been inspired by any system. The representations were sometimes utilised for the purpose of showing what absurdities could be committed from ignorance of theory, as in the case of landscapes, where distant objects were made as large as those which were near. It was supposed the artists were devoid of imagination, and assembled objects without any respect for scale and proportion. The effect of prejudice is seen both in the works of OWEN JONES and DIGBY WYATT at the time when South Kensington was in course of formation. The latter could write about art applied to industry in ancient times with scarcely a reference to what was doing for ages in the remote East. He could speak of the Portland and Auldjo vases as wonderful examples of the glass-maker's skill, and then add, "It is curious to find an exactly similar process of glass-working and cutting in use from the earliest ages in the East, particularly in China." Why should it be more curious in the East to cut through layers of glass? But the spirit of the expert is suggested by his remarking that the Chinese, unlike the Greeks and Romans, were led by "chance." If Sir DIGBY WYATT had followed out the subject he would have discovered that it was a principle, and a wise one, of Chinese artists to take advantage of accidents, and consequently there is a spontaneousness obtained which differentiates their work from that of artists in Greece and Rome. The question for moderns is not, however, the relative superiority of different schools of art, but whether each of them cannot contribute something which modern people will be able to utilise. If we consider ourselves to be the heirs of the ages, there is no reason why we should ignore our relationship to Japanese and Chinese artists, while we recognise kinship with the designers of prehistoric times.

In the small volume by Dr. BUSHELL, an authority who has resided some thirty years in Pekin, we are brought back to a very remote period. In a bas-relief, which will hereafter be considered as one of the most interesting documents in the world, we are introduced to Fu Hsi, the reputed founder of Chinese polity. He is represented as "the first of the three ancient sovereigns known as SAN HUANG, holding a mason's

* (1) *Chinese Art.* By S. W. Bushell. (2) *Japanese Colour Prints.* By E. F. Strange. (His Majesty's Stationery Office.)

square, in company with a female personage wearing a coronet and holding a pair of compasses." The inscription records he was the first to rule as king; he traced the trigrams or mystic symbols and introduced knotted cords, which seem to have been primitive aids to the memory of historical events, and of which a survival appears in the practice of tying knots in handkerchiefs as mnemonic aids. Of another ruler who appears in the same relief we are told "he fabricated weapons, dug wells in the fields, lengthened the official robes, built palaces and dwelling-houses." The Chinese, it will be seen, at a remote age anticipated those Eastern monarchs who considered building to be an art worthy of the attention of kings.

It is remarked by Dr. BUSHELL that China has kept in all ages to a single architectural model, and the monotony of the arrangement is increased by the precept that every important building must face the south. He considers that the Chinese realise the poverty of their normal type, and endeavour to break the plain lines by decorative details. Symmetry is incumbent except in summer residences, where license runs riot, for "we have pagodas and kiosques elevated at random, detached edifices of the most studied irregularity, rustic cottages and one-winged pavilions dotted down in the midst of surroundings of the most complicated and artificial nature, composed of rockeries, lakes, waterfalls and running streams spanned by fantastic bridges, with an unexpected surprise at every turn." Arches, however, can only be erected by special authority. They are generally of wood with a tiled roof, and are usually intended as memorials. Colour has a symbolic value. Sometimes only blue is seen in a temple, as in the Temple of Heaven. "At the Temple of Earth all is yellow, at the Temple of the Sun red, at the Temple of the Moon white, or rather the pale greyish blue which is known as *yueh pai*, or moonlight white, pure white being reserved for mourning."

Sculpture in China would appear to be at one time of great use in connection with records. Not only are inscriptions prized, and a good calligraphist is esteemed as a superior artist, but incised figures on stone are found which date from the first century, B.C. In them we see that chariots were in use which were sometimes drawn by four horses harnessed abreast, and the animals are represented with remarkable spirit. Figures of dragons and other strange animals are also introduced. Photography has been invaluable in rendering the character of the early examples, and the illustrations alone would confer importance on Dr. BUSHELL's book. By the process it is also possible to have details of bronzework, lacquers and carvings in jade, which, from their intricacy, would try the patience of an artist. In speaking of bronze vessels used in religious ceremonies the author says:—

The principal forms go back to a far distant antiquity and have become gradually moulded into fixed lines under the influence of that convention and routine which prevail in Chinese art. The introduction of Buddhism in the Han dynasty was the first impulse from an outside civilisation on an art which threatened to become stagnant from constant repetition, in the absence during so many centuries of rival schools to inspire progress. Some vases, it is true, have a certain grace of form and purity of outline, but the majority are heavy, barbaric, of ill-balanced proportions; and even the happiest models are not free from a vague impression of clumsiness, of hieratic stiffness. The preoccupation of the artist, or rather the craftsman, has evidently been to respect the ritual canons by which he is bound down, to measure exactly the swelling of the body, the profile of the neck, the flare of the mouth and the spread of the foot, so as to reproduce faithfully every line of decoration and symbolic design. The slender vases with trumpet-shaped mouths and some of the plain wine cups reveal a high plastic sense, and come within a shade of being perfect works of art; the touch that is wanting betrays the absence of the free spirit and love of pure lines which inspired the hand of the ancient Greek modeller in bronze. The motives of decoration of Chinese primitive bronzes are of two kinds, geometric and natural.

Rules and regulations were so long operative in China, it is not always easy for the superficial inquirer to distinguish between antiquity and modernity. The similarity suggests relationship with Egypt. Among the Japanese, on the contrary, there is so much individuality, or what appears as such, we can hardly imagine the Japanese artists as troubling themselves about ritual. If the love of the beautiful world in which we are placed, and the delight in endeavouring to represent what it contains, can be considered as virtues, the Japanese well deserve to be rewarded. No other people on any part of the globe have considered it to be so much of a duty to put on record their admiration of what is to be seen, and among the artists the humble authors of the colour prints hold a prominent place. In spite of the flimsiness of the material their work has been preserved. We have only to glance through the journal of the DE GONCOURTS to realise the amazement of fastidious French amateurs when they were able to obtain a glance at M. HAYASHI's collections. His prints were dispersed without any of them coming to South Kensington. But the Museum collection is of great importance, and in the Handbook no less than eighty-four examples are shown. They are deprived of colour, but as the photographic process was employed the details are given with the utmost fidelity. Their interest is enhanced by the excellent chapters which Mr. E. F. STRANGE has written. To obtain such a work for the small sum of 1s. 6d. does credit to the Stationery Office.

It is difficult to say when colour-printing became general in Japan. Some would say it is not older than the sixteenth century. The Jesuits may have had something to do with the employment of it. With their customary foresight they realised the capabilities of the people, and their great missionary, St. FRANCIS XAVIER, laboured in the islands. In the Roman Church coloured prints were at the time used as a means of instruction, and there was skill enough in Japan to be independent of importations from Italy. But an origin of a different kind has been suggested.

There have been several schools of painting in Japan as well as several generations of families who were artists. Drawing on wood for engraving was among the supplementary callings of painters. In Japan the drawing appears to be made not directly on the wood, as formerly in England when the art was practised among us, but on tracing paper which is pasted face downwards on the block. The lines were left in relief. Additional blocks were afterwards made for each colour, and, according to M. RÉGAMEY, the following colours were employed during the best period, viz. clear yellow, dark chestnut, dark blue, lettuce green, clear orange, mastic white, silver white, vermilion, red brown, black and red. It is not pleasing to learn that the old colours are now almost unobtainable in Japan, and that aniline colours are generally used. Some of the artists are, it appears, no higher in grade than men of the artisan class, and earn from a shilling to one and sixpence a day. They also follow other occupations. HOKKAI used to sell fish. The classes of subject which seemed to be most general were pictures of women, theatrical scenes and portraits of actors, illustrations of legendary and historical stories and landscapes. Concerning the last class Mr. STRANGE writes:—

Japanese colour prints devoted to landscape form a class apart in the art of the world. There is nothing else like them, neither in the highly idealistic and often lovely abstractions of the aristocratic painters of Japan, nor in the more imitative and, it must be said, more meaningless transcripts from nature of European artists. The colour print, as executed by the best men of the Japanese popular school, occupies an intermediate place, perhaps thus furnishing a reason why we Westerners so easily appreciate it. Its imagery and sentiment are elementary in the eyes of the native critic of Japanese high art. Its attempts at realism are in his eyes mere evidences of vulgarity. On the other hand, these very qualities endear it to us. We

can understand the first, without the long training in symbolism which is the essential of refinement to an educated man of the extreme East. And the other characteristic forms, in our eyes, a leading recommendation. In short, the landscapes of artists such as the Hiroshige approach more nearly to our own standards, and are thus more easily acceptable to us than anything else in the pictorial arts of China and Japan, while they have all the fascination of a strange technique, a bold and undaunted convention, and a superb excellence of composition not too remote in principle from our own.

In criticising these prints Western canons are insufficient. The novelty of the human figures is amazing to most Europeans. They are ready to praise the flowers, birds, fishes and grotesque animals which are introduced. But if one class of subjects is satisfactory either wholly or partially, it is difficult to believe that another class which is likewise a product of the same system can be wrong. The Japanese allow more importance to costume than Western artists, for they draw not only every fold into which a garment falls, but the patterns on it. Phenomena are also suggested in a manner which is peculiar to them. In fact, it would need a revolution to make Japanese art popular with all classes in Europe, and apprehensions of the Yellow Peril need not afflict manufacturers as much as it does politicians and warriors. It has, however, already rendered service in emancipating ornamentists from an excess of geometrising, and in suggesting that economy of strokes may become effective if there is a right selection and arrangement of them.

THE LATE GEORGE AIKMAN, A.R.S.A.

A WIDE circle of artistic and other friends will hear with regret of the death of Mr. George Aikman, A.R.S.A., which took place, says the *Scotsman*, at his residence, Scotland Street, Edinburgh, on last Sunday morning. He had an attack of pleurisy about a year ago, the result of a chill caught while painting out of doors, and from the effects of which he never recovered. Born on May 20, 1830, in a house at the top of Warriston Close, Mr. Aikman came of an artistic line, his father having been a lithographer and engraver. He was educated at the High School in the time of Dr. Boyd, and had among his class-fellows the late Professor Calderwood, Dr. Wallace and Bailie Colston. He learned engraving and lithography with his father at his place of business in North Bridge Street, where the plates for the first edition of the "Encyclopædia Britannica" were engraved and printed; and during his apprenticeship he attended art classes in the Trustees' Academy, then under the direction of Mr. R. Scott Lauder. He also began to exhibit pictures at the Royal Scottish Academy, and by-and-by, about 1872, he gave up engraving and took to painting, and as a painter of landscape and of landscape with figures he has since been known. His subjects were for the most part Scottish, but he also painted in the Severn Valley, and exhibited pictures of the scenery of that district. To the Royal Scottish Academy's exhibitions he was a constant exhibitor, and his pictures were also hung at the Glasgow Institute. Now and again he reverted to engraving and etching, and produced plates chiefly of his own pictures, though a well-known portrait by Lawrence was engraved by him some years ago. He has been an Associate of the Royal Scottish Academy for the past quarter of a century. For many years he was an enthusiastic Volunteer. On the formation of the City Artillery Volunteers he became a member, and was for a time quartermaster of the regiment. When a younger man, Mr. Aikman was a good deal associated with an art coterie which comprised within its circle such men as the late G. Paul Chalmers, J. M. Barclay, the portrait-painter, W. F. Vallance, and Mr. James Gow, banker, and to the end of his life Mr. Aikman had many friends among the artists of the city. At the Scottish Arts Club he was one of the most popular members, a circumstance due to his kindly nature, genial disposition, bright intelligence and great store of information about engravers and engravings, and generally about Scottish artists and their works. Very few men had a better knowledge of engraved portraits and of the old mezzotinters, and a talk with him on his favourite

subject was always enjoyed. His father had served his apprenticeship with the Lizars family, and of these eminent Edinburgh engravers and artists he could speak with much interest. His wide range of knowledge about engravers and artists was in a way unique, and Mr. Aikman had also the faculty not only of speaking but of writing about what he knew with much acceptance. He also took a great interest in everything pertaining to Old Edinburgh, and it was his invariable practice when he heard that a historic old house was to be demolished to make a sketch of it. Several paintings of his Old Edinburgh houses hang in the City museum. He is survived by a widow, two sons and three daughters. His eldest son, Mr. William Aikman, is the artistic head of a stained-glass establishment in London, and of his decorative work examples have from time to time been exhibited both in Edinburgh and Glasgow.

ANCIENT MONUMENTS.

THE dangers to which ancient remains in Ireland are exposed under the new conditions of ownership have been often pointed out in this Journal. We are glad to see a letter from an Irish archæologist, Mr. Richard Kelly, in the *Irish Times*, referring to a recent address of his, in which he says:—

I had then in my mind two recent instances where a neglect of the precaution of nationalising our historic monuments led to the particular ruins being put to purposes not calculated to render them in the future attractive objects of antiquarian interest, and where in one instance a fine old De Burgo castle was turned into a cattle shed, and in your issue of the 15th you referred to and commended my references on the occasion. It is unnecessary to argue on at length or at all go into the general question as to the advisability of some steps being taken to have every structure capable of being described as "an ancient monument," whether castle or church, cross or tomb, rath or liss, preserved to the country as a national possession and maintained free from future possible injury or neglect. The historic and artistic ruins of every country are a national asset, and as such are so regarded by every civilised people. In our country probably less has been done by direct protective action of the law to preserve our ancient monuments than anywhere else. Still, the relatively little which the existing law permits must be at once done or serious injury and loss to the nation of these priceless national treasures will result.

The suggestion I ventured to make in Galway to meet this case was that the Estate Commissioners, the Congested Districts Board and the Land Commission, in every case where land passes through their hands, upon which land an ancient monument exists, should transfer the particular monument to the county council of the particular county where it is situated. This body, under section 19 of the Local Government Act of 1898, is specially empowered to take measures for the control of, and preservation of, these monuments. I see no other effective course open under the existing law.

It may be thought that in suggesting this county custody one is recommending something exceptional. A reference to what, in this same direction, is being done in other countries may not, therefore, be out of place. France, Italy, Hungary, and even Roumania have each of them passed a series of restrictive and protective laws dealing with their respective national monuments, which are far in advance of anything ever yet seriously suggested here. Recognising, as these progressive countries do recognise, that the historic and artistic ruins of their country are a national heritage and possession which must be preserved and protected, they have taken steps accordingly. Thus we find in Italy a law imposing a maximum fine of about 400*l.* (10,000 lire) upon any person "who demolishes or alters any object dealt with by the law," that is the catalogued monuments, which practically comprise all of any historic value. In France penalties for similar offences are impossible, though not so heavy in amount; 200*l.* is the maximum penalty in Roumania, and in Hungary about 41*l.* is the amount which may be imposed for any infringement of the laws regulating the preservation of any ancient monument. Even the Finnish law is not silent on this subject. Both in that code and in the Hungarian one a curious proviso, however, is introduced, absolving a person from liability to report any discovery of an historic or artistic monument (the penalty for non-compliance being a fine from 5 to 100

florins) if his degree of education does not render it likely that he could have appreciated the value and importance of the discovery (Article 15 of the Hungarian code). Article 7 of the Finnish code exempts also from wanton destruction in such cases of undoubted ignorance.

The Hungarian law on this subject dates from 1881; the Finnish law from 1883; the French law from 1887; the Roumanian law from 1892; and the Italian law from 1902. The Hungarian of all these is the only one that does not deal with the case of objects of a movable character detached from the soil, and the French and Finnish laws do when such objects are in the possession of municipalities, ecclesiastical bodies, or such like corporations, and do not interfere with private possessions. A change in the English law in the direction of protecting movable articles would be very advisable, and particularly useful as regards "finds."

In France a catalogue of all objects of historic and antiquarian interest worthy of preservation is made out, and not only are the particular objects, but the land upon which they stand is appropriated by the State, and put under the control of the Minister of Education. In Hungary and Roumania the Minister of Public Worship is the protecting authority.

In France a commission of experts, of which he is the President, assists the Minister in these cases, and without their aid he does not act. Thus we find a Commission des Monuments Historiques was so far back as 1839 appointed for this purpose. By article 3 of the Hungarian law the authorities decide for purposes of preservation what monuments possess an historic or artistic value. Articles 1 and 2 of the law of the Grand Duchy of Finland forbid the owner or occupier of land upon which certain specified antiquities are to be found, including ruins of ancient castles, churches, tumuli, from demolishing or in any way injuring such monuments without notice to the public authorities, and allowing them, if they do so desire, to expropriate them for the State. Once an object in Italy is catalogued the owner cannot exercise any rights over it without the permission of the Minister, nor can even its sale be authorised without such authority, the State retaining a right of pre-emption. No corporate property can be alienated, changed or altered without such leave. In Hungary there is no catalogue or classification, but article 4 allows no alteration, addition, or modification in connection with any monument whose preservation has been decided upon without previous leave. The Italian and Roumanian laws forbid the clandestine sale or exportation of movable objects of such a character. The State in these countries also exercises another power—that of the expropriation or compulsory purchase of the object and of the land upon which it stands, including the approaches thereto.

In asking for some steps to be taken within the existing law to preserve our ancient and historic monuments I am not asking for any exceptional treatment of those national possessions or suggesting any undue interference with future proprietary rights in what were never intended to be objects of such individual rights against the higher claim of the State. I am but suggesting while it is time, and before something more active, potent than "decay's effacing fingers" set to work to injure the old castles, abbeys and other ruins of our country—"its history in stones"—their nationalisation and preservation for future generations and all time. It is needless to add that now when the land is finally passing from one class to another is the appropriate and appointed time for most effectively doing that, and it is plain that under the existing official machinery of transfer the Estates Commissioners are the authority to best carry out that national trust, and take steps to have the ancient monuments of the country handed over in each county to the county councils. In Galway, to facilitate that work of definition, separation and preservation of our ruins, our Archaeological and Historical Society made out a very comprehensive list of all the castles, abbeys and ancient monuments of our historic county and the townlands upon which they are situate. I would suggest, however, that the several county councils direct their county surveyors to make out such a list from the Ordnance Survey maps, and that they forward them to the Estate Commissioners. It then remains to be seen how far by instructions to their surveyors, inspectors and otherwise will co-operate, as I am sure they will, with the general desire to preserve and nationalise the ancient monuments of Ireland.

The Burnley Town Council decided, after a long discussion, to appoint Mr. Pickles, the borough surveyor, to act as architect for the proposed new technical school at a fee of 600l.

TRUTH TO NATURE AND STYLE.

LAST year Mr. Clausen's lectures drew crowds of exceptional magnitude to Burlington House, and the large audience that greeted the pastoral painter on Monday showed, says the *Morning Post*, that his popularity among his fellow artists and students remains undiminished. The professor of painting varied his subject slightly from that in the syllabus, and instead of dealing only with "Truth to Nature" devoted part of his address to a consideration of "Style." Mr. Clausen impressed on his hearers throughout that the one thing needful was the study of nature—that study which was, as Reynolds said, the beginning and end of theory. Only in nature can we find any source of beauty, but the artist can enlarge his view by looking at the work of others and noticing in what they have done that which has escaped his own observation. But it was not always the best works that had the largest number of admirers, nor were the best works always appreciated at once. Reynolds, for example, was unable to appreciate Raphael the first time he saw him, because the impressions of nature in the mind of Reynolds had no correspondence with those in the mind of the great Italian. Yet if Raphael's pictures had not been founded on a deep study of nature they could not have gained the esteem of the world. His truthfulness to nature could perhaps be seen best in his portraits, in the Pope Julius in our own National Gallery, in the Lady in the Uffizi, and in the Castiglione in the Louvre. The last, which was illustrated on the lantern screen, had qualities that rank it with the National Gallery portrait of Philip IV. by Velasquez. It had an atmosphere that one does not find in all Raphaels, and showed in the finest way what we call a sense of style.

Style is something beyond mere manner; it shows a grasp of the greater truths, something that comes nearest to the profoundest impression of nature. The Ilyssus, a model of style, is yet nature itself. Style does not depend on symmetry or proportion, for a Tanagra figure may be clumsy and yet fine in style. Style depends on expression, action and structural rightness. Mr. Clausen said that he ought to apologise for referring to sculpture in his lectures, but the quality of style belonged to form rather than to colour, and in sculpture he could more easily give examples of this. A beautiful Greek coin with a reverse, in composition not unlike the "Hope" of Watts, was shown on the screen, and this illustration was followed by photographs of two bas-reliefs from the "Throne of Venus" in the National Museum at Rome. In these reliefs, said the lecturer, the drawing is as good as a fine life drawing. The sculptor had gone as far as he could in leaving out; all had been cleared away except the actual essentials. Next a bearded head from the same museum was shown, and this, in Mr. Clausen's opinion, was even finer as an example of style than the reliefs. Everything in it was brought down to the simplest, yet, with all its severity, expression and character were perfectly given, and nothing essential was left out.

After the Greeks the chief masters of style are the great men of the Renaissance. One of the earliest and one of the best was Pisanello, in whose medals, one of which was illustrated, we find the same grasp of structure and essentials that are displayed in Greek work. Again, there was no closer student of nature than Leonardo, another master of style, but greater even than he was Michel Angelo. By the courtesy of Professor Colvin he was enabled to show them a reproduction of a splendid drawing of an undraped figure by Michel Angelo in the British Museum. Michel Angelo has been accused of exaggeration, but this drawing, so far from being exaggerated, is even modest. It has been searched out to the last truth—never carried beyond the point needed for expression, but taken right up to the limit of that point. After pointing out how great art can be shown in the commonest and simplest of things, illustrated in the pictures of Rembrandt, De Hooche, Jan Steen, and notably Chardin, whose beautiful still life study in the National Gallery was held up as an example to the students, Mr. Clausen turned to the work of a painter with whose art he is in special sympathy. Millet, he said, drew all his impressions from the nature around him, yet his style is that of the Greeks. There was something of their simplicity and feeling for the essentials in the drawing of a youth bathing which he showed them on the screen, and a second picture of a girl churning had the "rightness" of a Greek gem. Millet said, "An artist must be moved himself if he is to move others," and that was the secret of it all. Some years ago, when Mr. Clausen was in a difficulty because he could

not get a model to pose as he wanted, he told his trouble to Watts, to whom he explained that he had to rely on memory for what he wanted. "Well," said Watts, "memory is very good, but knowledge is better." He took a piece of chalk and drew the bones of the knee. "There," said the veteran, "when you know that it doesn't matter in what position you want to draw a knee." That is the difference between skill and knowledge. Skill we learn in the schools, knowledge from nature, and the latter should control the former. If an artist has knowledge of nature he knows that his utmost skill is as nothing compared with the beauty of the nature he wishes to express. Nature never suggests effort, nor does the masterpiece. The effect of a great painting is that you feel that you can go home at once and do something like it—but you can't.

OLD LIVERPOOL CHURCHES.

A GLANCE at Liverpool's earliest map, which is dated 1650, shows, says the *Liverpool Courier*, that this "good old town" was at that time composed of two lines of narrow streets running up from the river and one line cutting across them running north and south. The thoroughfares running from the river were Water and Dale Streets, while the other was formed of Chapel and Tithe-barn Streets. The thoroughfare in the north to south direction comprised the line of Oldhall Street, High Street (formerly Joggler, Juggler or Jogleur Street, which was about the oldest in local street nomenclature) and Castle Street. The northern extremity of the town was marked by the White Cross, while in High Street, about the point where Water Street line passed it, stood the High Cross, which was considered the centre of public activity in business and everything else. About this spot stood the first town hall (in pre-Reformation days St. Mary's Hall), which combined the purposes of a civic mansion-house, a lock-up for prisoners and the customs house. In this modest building municipal banquets were held at a cost of about 20s., though when Lord Derby was entertained with lavish hospitality the expense ran up to 24s. At the foot of Chapel Street was the old church of St. Nicholas, which was built between seven and eight centuries ago, and at the south end of Castle Street still stood the Norman castle.

Liverpool Castle used to be traced back to the time of Roger Poictou, upon whom the manor of West Derby was conferred by William the Conqueror. But antiquarian investigators will not allow the old castle the antiquity which was claimed for it, though as it was swept out of existence in the early part of the Georgian era the antiquaries might have made allowance for local sentiment and let us still believe we once possessed a building of the Conqueror's time. The old castle was quadrangular in shape, with a circular tower at each angle, and was surrounded by a moat about 25 feet deep. And the 1650 map shows the old tower, the "stone house" of the Stanleys, which was embattled by Sir John Stanley exactly 500 years ago by permission of King Henry IV. This was the Sir John Stanley who married Isabel, the only daughter of Sir Thomas Lathom, whose grandfather had married Katherine, daughter and heiress of Sir Thomas de Knowsley, and thus brought the Knowsley estate into the family.

It was not until near the close of the seventeenth century, about fifty years after Liverpool's first map was drawn, that the people of the town, obtaining parochial independence of Walton, decided to have a second church. At this time there does not appear to have been any other place of worship in the town except the Old Church. St. Peter's, the present pro-cathedral, was erected in the fields, for there were then no other buildings in what became Church Street, and this new edifice was consecrated exactly two centuries ago. Two years later (in 1706) "the people called Quakers" opened their first meeting-house here in Hackin's Hey, and the *locale* is indicated by the still existing Quaker's Alley.

In 1734 was consecrated St. George's Church, built on the site of the old castle, and lately demolished to make an open space and give a suitable position for the Victoria memorial. St. Thomas's Church, which is now condemned by the Bishop's Commission, was originally opened in 1750, and about this time the Roman Catholics provided themselves with a modest chapel in Edmund Street, which underwent several variations till it became the present-day St. Mary's. As early as 1700 the Baptists, under Dr. Daniel Fabius, had a little chapel in remote Everton, but in

1722 the congregation removed to Byrom Street, converting into a place of worship the barn of Townshend House. Some years later they again removed to the corner of Circus Street, and the building they had vacated near old Shaw's Brow became St. Stephen's Church of England. This had to be demolished a few years ago for the widening of William Brown Street (Shaw's Brow that used to be), and the erection of the Technical School, while a new church was built nearly opposite Great Crosshall Street.

In 1726 Benn's Gardens (Unitarian) chapel came into existence, and it was a minister of this chapel (the Rev. John Henderson) who became first incumbent of St. Paul's Church (now condemned), which was opened in 1769. The Wesleyans opened their first Liverpool chapel (Pitt Street) in 1750, but a hundred years ago it was rebuilt and enlarged.

The town was growing, and before the dawn of the eighteenth century six additional churches had been added to the local resources of the Establishment. These were St. Anne's, in the fields at the end of partially-built St. Anne Street; St. James's, Toxteth, though the population of that region was sparse and scattered; St. John's, which was only recently demolished and superseded by public gardens, with statues of local worthies; Holy Trinity, St. Anne Street; St. Matthew's, Key Street, which was bought from the English Presbyterians in 1795, but has since disappeared to meet railway exigencies; and was not the "Scotch Kirk" in Scotland Road converted into St. Matthew's Church of England as a result of Presbyterian divisions? In 1796 Christ Church was opened to accommodate 2,800 people. Another Dissenting chapel called the Octagon in Temple Court was bought and used as a Church of England from 1776 till 1820. Of course, in the meanwhile the Dissenting bodies had also been active in the provision of churches, while the Church of Scotland opened its first local church, which still stands in Oldham Street. The town's population, which was about a thousand in 1650, had more than quadrupled before the close of that century, while the census of 1801 gave Liverpool a population of 77,708—roughly, a tenth of the present-day number of people.

In the twenty years following the first census of the nineteenth century, while more than 41,000 people were added to the population of Liverpool, only three churches connected with the Establishment were erected, as pointed out by the late clerical statistician, "Father Abraham," to give the late Canon A. Hume the name bestowed upon him in friendly colloquialism. The three churches erected in that score of years were St. Mark's, Upper Duke Street; St. Andrew's, Renshaw Street, built by Sir John Gladstone, and in recent years moved to Aigburth Road; and St. Philip's, Hardman Street, rebuilt in Sheil Road. Besides these there was the church erected in 1818 in connection with the School for the Blind in London Road, removed in 1850 to its present location in Hardman Street. On the other hand, the Dissenters' Octagon in Temple Court, which had been for a time used as St. Catherine's Church, had given place to a fire police-station. But two churches had been erected in the outskirts for the use of the expected population. These were the plain brick edifice St. Mary's, Edgehill, built in 1812, and the stone structure St. George's, Everton, erected in the following year. Among other places of worship opened in the town in the twenty years was the Jews' Synagogue, Seel Street (1807). The church of St. Michael in the Hamlet was built (largely of iron) in 1815, but that edifice was remote from the Liverpool of that time, and the movement of people in the Toxteth direction had been restricted, the popular tendency being in north and east directions, Everton and Edgehill showing signs of development.

The Royal Birmingham and Midland Counties Art Union ballot took place on the 5th inst. An oil-painting by Edgar Bundy, R.I., entitled "At the Apothecary's," value 65*l.*, was the first prize. Sixteen thousand tickets had been issued, of which 5,302 were sold. After deducting the necessary expenses there remained 185*l.* to be balloted for. That was divided into prizes as follows:—First, 65*l.*; one prize of 15*l.*, which would be chosen by the winner; seven of 10*l.* each, and ten of 5*l.* each. To those were added two extra prizes unclaimed from the last autumn ballot—"The Old Manor House, Old Walford," by Oliver Baker, value 10*l.*, and "Floodgates on the Blythe," by W. H. Vernon, value 10*l.*

NOTES AND COMMENTS.

By the death of Professor ERNST EWALD, Germany has lost her highest official representative in industrial art. It is supposed that not less than ten thousand artists must at one time or other have come under his direction. He was respected by the late Empress VICTORIA, the English Princess Royal, and gave instruction in her atelier to the KAISER and his brother Prinz HEINRICH. He was a native of Berlin, where he was born in 1836; he studied in Bonn, but instead of following the usual academical course to a professorship, he turned to painting, in the study of which he spent several years in Paris, Berlin and Italy. ERNST EWALD was an enthusiast for mural work. He painted scenes from the Nibelungen in the National Gallery, and his works are to be found in other public buildings not only in Germany, but elsewhere. His talents fitted him for demonstrating applied art, and in 1874 he was appointed Director of the Kunstgewerbe Museum. Under his direction the scope of the institution was enlarged, and it is now one of the most important in all Europe. He was also head of the Royal Art School, which used to be only a part of the Academy for Art.

OUR new century is likely to be characterised by its grandiose building projects. There never was a time when it was so easy to obtain a plan for the transformation of capitals. It would seem to be sufficient to draw lines of streets on plans with the boldness resembling that of Sir JOHN RENNIE when he marked out railways, that is, to fix on the terminal points and connect them by straight routes, and people will willingly undertake the destruction and erection which is necessary. Mr. A. R. BENNETT, M.I.E.E., in his scheme for a Temple Bridge with County Buildings to span the Thames, only proposes two new approaches, one from the Strand to the Thames, and one from the Thames to St. George's Circus, but he would blot out what is left of the perspective of the Thames with the callousness of a railway company. The latter have at least constructed lattice bridges, but Mr. BENNETT's County Hall would be as substantial a structure as either the Gothic or Renaissance style would allow. If the building had to correspond in growth with the Metropolis, we suppose it would become more portentous by the addition of storeys. It is not necessary to discuss the proposal, for the London County Council will never accept inspiration from outside sources. But it is an indication of the spirit of the time and the desire for startling novelties. Mr. BENNETT's design may not be adopted, but he probably will find a reward in some other way, for so much courage deserves one. It is also refreshing to find that in the twentieth century Old London Bridge, with its rickety timber houses, which almost formed a rude arcade, and the Ponte Vecchio, Florence, with its little shops, should be selected as models for imitation. The project if realised is supposed to serve two purposes. One is a junction between the northern and southern systems of the Council's tramways. But as metropolitan communications are at present in an indefinite state, it will be time enough to propose new lines when private companies have acknowledged they cannot completely solve the problem. As regards a hall, the Metropolis is wide, and there is no necessity for the County Council to seek a costly site for offices near Pall Mall. There are many districts where the erection of a fine building for the purpose would produce an elevating effect in the neighbourhood, and improvements would be carried out at the expense of individuals.

SUNDERLAND HOUSE (RESIDENCE OF THE DUKE OF MARLBOROUGH, K.G.), CURZON STREET, W.

DAVI LEWIS HOSTEL, LIVERPOOL.

COLONNA DELLA LUPA, SIENA.

IN the time of AUGUSTUS, when Siena became a Roman colony, it acquired a right to use the arms of the wolf suckling the twins ROMULUS and REMUS. These arms are used in the ornamentation of some public buildings of the town, but are nowhere so prominently represented as in the present instance on the top of a column. This work, cast in bronze in 1620 by DOMENICO CAVENDON, is now much discoloured, so that it is not easy to criticise its merits in detail. It occupies a prominent position in the piazza situated between the church of S. Cristoforo and the Palazzo Tolomei, and cannot fail to be seen by those taking the ordinary route from the railway station to the much-frequented hotel Aquila Nero, or the central points of interest in the town, such as the Palazzo Publico or the cathedral. The Palazzo Tolomei, before mentioned, is the building shown to the left in the sketch, and is one of the earliest private palaces in the town. It was built by IL TOZZO in 1205, and was evidently in its earlier days a palace of much importance, for when ROBERT, King of Naples, visited the town in the year 1310, this palace was chosen for his residence. The façade is not broad but lofty, very plain and massive up to the string-course under the pointed windows, of which there are two rows of five in each, under a bold cornice, consisting of a simple cove. Observe the curious form of the voussoirs of the segmental-headed door. The principal doorway, part of which is shown, will be found more fully illustrated in Mr. ROBERT ANDERSON'S work, published a few years ago. The palace has evidently undergone some alterations. The interior contains little that is remarkable, unless it be a hall with fresco-paintings by Buonsignori LIVORNESE, but this work is of no great importance in a town well known for its remarkably fine early frescoes.

THE TOWER OF THE "MARTORANA," PALERMO.

THE church of Santa Maria dell' Ammiraglio, or, as it is commonly called, the "Martorana," is certainly, says Mr. HAIG, one of the most interesting relics of the Norman sway in Palermo. Very little of its actual interest is suggested by the exterior, however, for, with the exception of the tower over the western entrance shown in the sketch, and just the upper part of a flat dome, which could not be brought in, the actual and original exterior has been cased in by a Late Renaissance shell, dating from some 200 years ago, when the taste for that Rococo architecture so much employed by the Jesuits seemed to have taken a hold of the Palermitan architects. Of this style is also the western portion of the interior and the altar and fittings generally. The main part of the interior is original and in the form of a Greek cross, covered at the intersection by a dome of Norman-Saracenic character, with curious and effective pendentives, the whole covered with glorious mosaics of Byzantine type, somewhat stiff as usual, but dark and rich in colour. The church was built in the time of King ROGER, early in the twelfth century, by the High Admiral of that king, GEORGE ANTIOCHENUS, and the memory of both king and admiral is perpetuated by two mosaics here, one representing the king crowned by OUR SAVIOUR, a frequent form of votive representation in those days, and the other shows the admiral in the act of kneeling before the VIRGIN. The former of these pictures recalls a somewhat similar one over the royal throne in the cathedral of Monreale, representing King WILLIAM THE GOOD, also crowned by the SAVIOUR. The tower serves as an example of the influence of Saracenic traditions on the Norman builders, as in the sunk surface ornaments, which were probably filled in with mosaics. The top of the tower may have terminated similarly to the smaller towers of the cathedral, with a short spire and four pinnacles.

HOUSES, DARTMOUTH ROAD, BRONDESURRY.

PREMISES, PRINCE'S STREET, HANOVER SQUARE.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last in the new premises at Tufton Street, Westminster, Mr. E. Guy Dawber, president, in the chair. Mr. ALFRED COX read the following paper, entitled

Public Libraries.

The building and arrangements of public libraries, which is the subject of my paper to-night, is a very interesting one, embracing as it does all sorts and conditions of buildings, from the medium-sized, ordinary free public library to the magnificent buildings of our own country, and those of France, America and Germany, in which are housed the libraries of more national character—such as that within the British Museum, the National Library of Ireland, the National Library, Paris, together with the well-known examples in Boston, New York and Washington.

In speaking on this subject to-night I do not propose to deal with the history of libraries prior to the passing of the Act, nor shall I discuss the general advantages of education which the passing of that Act brought about. This is all very interesting in its way, but I think, as far as we are concerned, our interest is principally in the buildings themselves. And in dealing with these buildings I shall confine my attention more chiefly to the smaller class of library building generally adopted by the various towns in this country, and which would probably be erected for sums varying from 2,000*l.* to 10,000*l.*

As you are aware, there have been several useful books written on libraries, and papers have been read from time to time both here and at the Royal Institute of British Architects on this subject, so that I do not know that I can add very much to the excellent information contained in them, but I shall endeavour to point out the uses to which the various rooms would be put, and their suitable position within the building in relation to one another. During the last few years there has been a great deal of architectural work brought about by the erection of public libraries of this type, and many towns that otherwise could not do so have been enabled to add to their public buildings in this way, owing to the generosity of certain individuals, among whom may be mentioned more particularly Mr. Andrew Carnegie, Mr. Passmore Edwards and the late Mr. Henry Tate, all of whom have given large sums of money for the purpose. The plans of these buildings, many of which have been published in our professional papers, show various ways of dealing with the peculiarities of site and the special requirements necessary, at the same time having due regard to the sum of money to be expended. In the first place, it is of the greatest importance that a suitable site should be provided; on this almost entirely depends the satisfactory planning and general economical arrangements of the building to be erected on it. It should, of course, have good light around it, and also be in as central and yet as quiet a position as it is possible to obtain. It should be large enough to allow of any probable future extension of the building to a reasonable degree; but in the case of suburban towns, which spring up like mushrooms, and develop at a rate far beyond the most careful calculation, the best solution of this problem will possibly be by means of small branch libraries erected in suitable positions. With regard to the general arrangements of the plan, these should, of course, like any other building aiming at satisfactory results, be very simple, and, if possible, all the public rooms arranged on one floor. This, however, often cannot be done, owing to the limitations of the site, and in such cases the more public rooms to which most easy and ready access is required, such as the news-room and the lending department, should be placed on the ground floor, and the less-frequented rooms and those for special study, together with the librarian's office, on the upper floors. Supervision is of the first importance, and in planning should be always borne in mind, and it is usual to arrange for this by placing the staff-counter in an enclosure connected with the lending department in such a position that the attendants, who are generally at work there the whole day long, can command the main entrance, and as many of the rooms as possible. In connection with this it is a mistake to conclude that the librarian is the policeman of the building, his work being of far greater importance than that, although probably in very small libraries he may have to do all the work, with possibly the assistance of a youth. He should be in a position near to his assistants, but it is not necessary to place his room in a prominent position as regards the public. All the public rooms should be lofty

and well lighted; the ventilation should be especially considered, so that the air can be changed frequently, as at certain times in the day these rooms are often crowded, and any feeling approaching to stuffiness is most unpleasant, besides being unhealthy for the readers, and renders the work of the attendants who are there always doubly trying.

A free public library, as a rule, has to be completed for a sum that allows little for architectural splendour, but the requirements, being generally very simple, lend themselves admirably to a successful and dignified treatment, provided the designer confines his attention to such vital matters as good proportion and simplicity, with suitable details of whatever style he may adopt to emphasise them and not be carried away by any unnecessary feeling that the building wants breaking up somehow. This breaking-up, as a rule, is quite superfluous to the real requirements of the plan, embracing very often as it does bay-windows and odd corners, neither of which are happy features in the public rooms of a free library, and is but too often the amazing conceit of the pencil as opposed to the common sense of the indiarubber.

After all, the public library is, or should be, a local centre of culture and, apart from the books, the building itself should be of such a character as to elevate the minds and educate the public in the art of architecture, and make them feel that they are in a place which inclines them to improve their minds and morals in every way. I am afraid library committees often overlook this and disregard the real and good in architecture in favour of the more showy on paper, which often masks an ill-arranged plan; the former being looked upon as a sort of joke and likened to a stable, a workhouse, or any other building which they do not associate with architecture, but think merely bricks and mortar; whilst the latter, exhibiting all the tricks of draughtsmanship to illustrate the commonplace, is loudly praised.

I will now give you a more detailed description of the internal arrangements of a library, but I think these are pretty generally known; however, the memory cannot be refreshed too often, and possibly if most of it is forgotten some of it will stick and prove useful in the future. The entrance should be spacious and open into a good-sized hall or broad corridor, and these lend themselves to be particularly studied as the architectural features of the building. First appearances go a long way, and I should always endeavour to make the entrance attractive. From this hall as many of the rooms as possible should be directly approached; the more frequented rooms, as I mentioned before—such as the news and lending-rooms—being, if possible, nearer the entrance. The counter or enclosure of the lending library should be conspicuous on entering, and, to my way of thinking, is better entirely open than having to pass through swing-doors to reach it. The reference-room, being used by students and readers of more serious books, would necessarily be placed in the quietest part of the building, and in such a position where it would be unnecessary to be passed by people going into the other rooms. I suggest as a good place for it within the lending library counter, so that readers—as a rule there are not many—could pass into it through a wicket gate, which would be under the control of the attendants. The books, too, in this room, being of more value, are thus afforded better protection, and the attendants know who the people are they pass into the room. In the case of a small library, a space for a table to be used by reference readers might possibly be arranged in the lending library itself by arranging the book-cases in a suitable manner, and I think in many cases this would give all that is required. In some buildings a separate room is given for juvenile readers, and great care must be exercised in planning so as to put this in a position near the attendants, and also where the occupants cannot make themselves a nuisance to the other readers. A separate entrance from the street is sometimes provided for this room, but I do not think it is a good arrangement, as, among other things, it makes an easy escape for the mischievous youngster after “cheeking” the attendants, and has many objections.

One main public entrance for all parts is the simplest, and gives better control than where there are more. In a library building of ordinary size I don't see why the principal entrance should not open into a large space, which could be subdivided by arches or columns with balustrades, so as to group the various readers into the usual sections, viz. magazines, news, lending, &c. Surely one person reading a newspaper and another a magazine can do so

without having a solid wall or even a glazed partition between them. This arrangement would give excellent control, and there would be no annoyances caused by such small matters as the opening and shutting of doors. Of course, great care would be necessary to exclude draughts, and I can see no difficulty in this any more than in a building of a larger area. The librarian's room is well placed on the counter enclosure side of the lending library. It need not have any direct communication with any of the public rooms; in fact, it is an office pure and simple, where the occupant has much work to do without being continually worried in the control of the public using the library. This room is often used for the meeting of the library committee. With regard to the lavatory and water-closet accommodation for the public, this is sometimes provided, but in a small library I think it has many objections, and is liable to be a great nuisance. Of course, it is necessary to provide for the staff, and in many cases for both sexes, as female assistants are now very commonly employed. A good store-room and work-room and a mess-room for the staff should also be provided within easy access of the lending library, and a separate entrance for delivery might be arranged in connection with these rooms. The lending library should be arranged so as to be worked either by the indicator system or by a more recent method known as the "open access." In the former case there must be a long counter for the indicators, with issue spaces in between them. The amount of space occupied by the indicators varies from 35 inches to 10 inches for each 1,000 numbers, according to the particular type adopted. The counter should be somewhere about 32 inches high, so as to allow children and people of small stature to clearly see the top numbers of the indicators. The length of counter would be determined by the number of indicators in use, and a sufficient allowance should be made for possible extensions. As regards the issue desks, two, each of 3 feet wide, should be allowed to every 10,000 volumes. Good light on both sides is very necessary, so that the public on the one side and the attendants on the other have no difficulty in reading the numbers. In the case of the "open access" system there must be an enclosure of ample size at the entrance to the lending library. In this an attendant would receive a book from the person returning it, and would then allow him to pass through a turnstile or wicket gate into the room itself, the gangways being only wide enough for a single file of people, where he could choose his own volume from the shelves and pass out through a similar gate or turnstile in the other side of the enclosure. The bookcases should be arranged "end on" to the counter or enclosure, and in close proximity to them, as an extra yard when multiplied by several visits a day considerably adds to the work of an attendant. It is a question whether it is not more satisfactory to keep the books out of sight in "a stack-room" (to borrow an American name) rather than have them within the view of the public. I always think there is a very untidy look about the cases themselves, particularly the iron ones, which does not add at all to the general appearance, and if only the space occupied by the public together with the issue-counter and the enclosure were seen it might be made a good feature, and treated architecturally as a central hall or in any way else that might suggest itself. It is a mistake to be too economical with the size of the hall, and as long as it has no odd corners in it or obstructions, a good area might well be allowed, and if it could be managed so as to do without corridors it would be all the better and much easier to supervise. It is also a point to be remembered that many of the readers in the news-room are people in want of a situation, who go there solely for the purpose of consulting the advertisement columns of the daily Press, and it saves a lot of traffic in the library if the entrance lobby is made large enough to accommodate on the side walls notice boards for the display of the advertisement sheets. But of course this means that the vestibule or lobby must be made fairly wide, so that easy access to the library itself is not interfered with. The stack-room might be made high enough to take two or more tiers of bookcases over the lower ones by having a light floor of perforated iron gratings between them. These floors would be reached by a straight staircase of about 3 feet 6 inches minimum width. A circular staircase is not desirable either to go up or come down. A book lift in a well-considered position is of course essential where there is more than one tier. With regard to the bookcases themselves, these are about 16 inches wide for a double one (for books on both sides), and the height is anything between 7 and 8 feet. A step is often provided so that short people

can more easily reach the upper shelf. These double cases are better without a central partition between the books, as it allows of a freer current of air and does away with corners where dust might accumulate and also facilitates the washing and dusting of the shelves. A small fillet, however, might be nailed along the centre of the shelves to prevent the books from actually touching. Wooden shelves are generally $\frac{7}{8}$ inch thick, and should not be longer than 3 feet, as anything above that is awkward to use and has a tendency to sag. Wooden shelves have a better appearance than iron; they are cheaper, and if the corners are rounded do not tend to damage the bindings of the book so much. Iron shelves are of course more fire-resisting, but unless the whole building is made absolutely fireproof there is no real advantage in it. The bookcases should not be at a less distance apart than 3 feet, otherwise it is difficult to stand far enough back to see the upper shelves, and at the same time to allow people to pass. In the case of the "open access" a greater distance still should be allowed, and 4 feet taken as a minimum. All counter tops or slopes should be of polished hard wood. Of course, I know many of us do not like the appearance of this, but it is a case where experience tells us that common sense is better than "high falutin'" ideas, however much we may sigh for wood left in its natural state to become interesting by use and time. Floors must be rendered as noiseless as possible, and wood blocks or cork carpet are generally used. Care must be taken, in the latter case, to have the floor thoroughly dry and well ventilated from underneath, otherwise dry rot will occur. The walls should have glazed brick or tile dadoes in the public rooms and lobbies, as without them they are apt to get very much knocked about. With regard to the heating and ventilating arrangement of coils on the low-pressure system, with a sectional independent boiler, will probably give the best results on account of its easy and economical working. Artificial lighting by gas is bad, as it causes the bindings of the books to rot, and electric light where obtainable is very much better both for health and cleanliness. Fresh air introduced by inlets behind the radiator so as to warm it before entering the room, and grids in the ceiling through which the foul air passes into an airtight trunk is, I think, as simple and efficient a system as any among the many in use. Of course, it does not do to depend only on natural ventilation, and the introduction of electric fans gives much more certain results as it allows of control if used intelligently.

In many libraries a residence for the librarian is arranged, and suitable accommodation for it is to provide two sitting-rooms, kitchen, scullery, pantry, with three or four bedrooms, bath-room, &c. In other cases the caretaker only will live on the premises, and for this the provision of a kitchen with scullery and pantry, a living-room and two bedrooms and a bath-room should be sufficient. With regard to the style of the rooms themselves, the larger ones should be treated as small halls rather than rooms, and the satisfactory lighting of them must be carefully considered. Good lofty rooms with windows high up, and, where possible, opposite to each other for cross ventilation is a good arrangement; the height of sills from the floor line being about 5 feet up in the news-room and lending library, so as to allow newspaper slopes and bookcases to run continuously round the walls. In the other rooms the ordinary sill height is preferable. Personally, I do not like the appearance of either skylights or lantern lights; they tend to make a room anything but cheerful, and the idea of not being able to see out at all is objectionable. Of course, in certain cases it is difficult to do without them, but if possible always try hard to avoid them, at all events for your main lighting. They are also unsightly things on the outside, and rather make a building look like a hotel billiard-room or swimming-bath. In a small library rectangular rooms would be the best and most economical for furnishing. Bay windows and odd corners are wasteful, and not easy of supervision. Unless there is anything against it, clear glass is preferable for the windows, and if any coloured glass be used, let it be done sparingly and be of the best quality.

It is always pleasant to look up and out now and then, and anything in the nature of opaque glass is objectionable where there is no reason for its use. With regard to the exterior appearance of a public library great simplicity is as a rule absolutely necessary on account of cost, and is more dignified than the multiplication of much detail. The commonplace, with its many features, most of which are to the scale one associates with a wedding cake—the detail being very similar—is much admired by the uninitiated, who

love to see a thing with plenty of detail on it, and which looks like a mighty effort of the designer to cram in all he knows (or all he does not know) in every style of architecture. If it were possible to do without pencils or other sharp pointed instruments and draw with something blunt, I think in a generation or two we might see some of that regard for mass and proportion so highly appreciated by the ancients, and about which we hear so much but see so little, and the scale of detail might also be consistent throughout. However, I am not here to discourse about the possibilities or shortcomings of modern architecture, but I should like to see our public libraries designed with more character and restraint; and when I say restraint I do not mean that mere holes in the walls for windows and doors is the right kind of simplicity, for this is nothing but poverty of ideas in design, and is not restraint at all. The art of leaving out should be deliberate, and can only be acquired satisfactorily by constant study and experience. Mr. McKim, the well-known American architect, who is responsible for the designs of some of the finest libraries in America, when over here last summer, I think it was, as the guest of the Institute, told a friend of mine that he was surprised the splendid style of the old work here, more particularly that by Inigo Jones, Sir Christopher Wren and their contemporaries, which might well be called our national style, was not more cultivated (collectively not individually) by our present-day architects for public buildings. Here we have at our very doors a grand architecture, and I feel sure Mr. McKim is right in his remarks, but the work must not be studied from the illustrations of the handful of men who are doing such work which appears from time to time in the pages of the building papers. I have borrowed several plans from gentlemen whose names are well known to you, as possibly are the buildings erected from them, and I should like to express my thanks to them for the loan and also for a good deal of information respecting the buildings.

Mr. MAURICE B. ADAMS said:—There appears to be scarcely anything which anyone possessed of experience in library planning would wish to take serious exception to in Mr. Cox's paper on this subject, consequently it is not quite easy to promote an animated discussion; and, moreover, having myself undertaken to read a paper on rate-aided libraries during next month before the Leeds Architectural Society, I am precluded from saying on this occasion all that I have on my mind on the matter, otherwise by anticipating my lecture I might be thought lacking in courtesy to our *confrères* in Yorkshire. It seemed due to you that this explanation should be made. The same paper was read last month in the Law Library at Liverpool before the Architectural Society of that city, and its publication for the reason just mentioned had obviously to be deferred for the present. However, I willingly respond to the invitation of the committee of the Architectural Association to attend this evening, and it gives me special pleasure to thus support the chair and to commend the remarks which Mr. Cox has been good enough to put before us. His design for the Kingston-on-Thames library, accepted in preference to my own in a limited competition a few years ago, makes a very admirable building, and the wisdom of the choice then made has been demonstrated by its execution. Last year, when acting as professional assessor for a public library at Wakefield, I had an enormous number of plans to deal with—many of them of distinct merit—but the result proved to be that Mr. Alfred Cox secured the honourable position of being chosen as architect for that building. These two circumstances, in which my professional relationship with our lecturer to-night happened to assume a concrete form, enable me to realise how thoroughly he has, on occasion, put his knowledge to the best advantage. I anticipated consequently that he would have incorporated in his paper to-night some decidedly precise and detailed particulars such as might lead to a more practical issue between us than that which seemingly is likely now to result. It is true, as he says, that admirable handbooks have appeared, and that other papers on libraries have been read, but we are every day going either forward or receding—there can be no standing still, the movement must be perpetual. I venture to doubt the wisdom of architects confining their attention too strictly to a mere knowledge of buildings as buildings, and their range of interest cannot advisedly be restricted to the question of libraries as buildings only, without embracing also their educational scope and possibilities. It is essential in all specialised work of this kind for the architect to cultivate a more or less intimate acquaintance with its process of contemporary develop-

ment. The library at the present juncture is already in a transitional stage, emerging, let us hope, from comparative obscurity to the full recognition of adequate importance long enough ago accorded to it in America. The architect ought not to be content to follow only; while faithfully interpreting the wishes and adhering to the instructions of his clients, it is his business surely to do more than that, so as to assist, at least, in some degree, the promoters of such undertakings as libraries to erect up-to-date premises fully adapted and equipped in accordance with the trend which improved methods and enlarged ideas are daily assuming. In my paper, to which reference has already been made, there is one aspect of the library question to which I have devoted perhaps by far too little space, and it may be thought by architects, therefore, to that extent an opportunity has been lost. I allude to the artistic character of library buildings. With your permission possibly I may be allowed briefly to make good, as far as I can just now, the omission referred to. Eminently as a first principle, I suppose, the somewhat trite stipulation ought to prevail as to a library (or, for that matter, any other building) being made to look just like what it really is, not a school, or a house, a town hall and offices, or a church. The style of such premises is easy enough to start with, but not by any means so easily put into practice satisfactorily; very often it has been sadly ignored. This shortcoming is more than often due to the fact that the special characteristics are masked by too close an adherence to traditional architectural lines instead of allowing the particular needs of the interior to determine the exterior treatment. It is, I know, a very old reason to restate here, for it is patent to everybody. Mr. Cox has impressed us with the need of making libraries beautiful and worthy of their destiny. He alluded to the effect of skylights and their likelihood to make a library resemble a public bath, or perhaps a billiard-room. In parentheses, let me add that quite apart from their appearance, roof lights are, in my opinion, open to several objections in a library, and especially if no ceiling lights are also provided. They are noisy when heavy rains are falling, and they are too subject to variations of temperature, causing down-draught, as well as difficulties to keep them water-tight. Ceiling lights also get very dusty and need provision for easy cleaning. I much prefer vertical dormers and lantern lights—they aid ventilation better, and, at least, are capable of architectural treatment. Still, skylights have to be employed at times, and by preference one puts them on the rear slopes of the roof, out of sight. Where no choice is left, and they have to be located where they otherwise would be conspicuous, I fancy their presence can be masked by good tall parapets, because such sloped lights need not be near the ridge. This idea of a parapet implies a cornice, and that in turn indicates a monumental façade necessitating a more than usual breadth of handling and scale. Then, again, Mr. Cox has intimated that angles, bays and projecting features have a tendency to break up designs needlessly and obstruct supervision, which, in a way, is perfectly true. And, further, he suggestively dilates on window contrivances. We all know that windows placed low down in libraries waste internal wall-space and encourage loafing, which constitutes one of the bugbears of modern reading-room work. Then, added to the possibilities of fenestration arrangement will be found ample scope for inventive skill in the management of the main entrance to our libraries. It should be spacious and dignified. Last of all, and dominating all these details, however, comes in the primary advantage belonging to the facility of supervision, always and only to be insured by making all the public rooms on one floor. Consequently the general outline of an ideal library, where the site allows of this arrangement, should be comparatively low in proportion with a spreading plan. These, then, are the prevailing conditions to be observed in façade management of library design, and they are sufficiently diverse to allow of considerable variety of treatment, but there can be no reason why these buildings should be made bald and forbiddingly severe with uncouth, bald expanses of brickwork or prison-like masonry, instead of encouraging a sense of picturesque homeliness and brightness of effect. On the other hand, all playfulness peculiar to a building adapted mainly to passing amusement or even social hospitality ought to be avoided, and it goes without saying that all stuck-on ornament and vulgarity of detail is always out of place. For style, the English Renaissance appears best adapted to present-day needs by allowing sufficient margin of diversity consequent upon the exigencies of sectional contrivance, as also the immediate arrangement of planning. This reference

to the sections of these buildings directs attention to one of their essential peculiarities, owing to the relative heights of their internal dispositions, which demand the utmost care and attention where economy and compactness become determining factors for success. They exercise a controlling influence, too, on the exterior, imparting the very individuality which every architect of taste only too readily recognises. Mr. Cox has rightly drawn attention to the gain associated with an impressive, not to say stately, entrance-hall, out of which the several departments should diverge. The fault, nevertheless, which sometimes may be noticed in this respect, is that designers of libraries overlook the great importance of proportionate height required to insure a real feeling of spaciousness, so that by this oversight halls which look roomy enough on the plans are cramped in effect by reason of an upper floor or mezzanine above crushing their height down to perhaps 8 feet or even less. The larger the plan the greater the depression. Instances of this could readily be mentioned. As to the architectural treatment of reading-room interiors by arcading and intercolumniation, opening up the whole series of apartments into one large undivided whole, no doubt the lecturer's suggestion possesses the merit of ambitious possibilities, but the vast majority of librarians prefer separate rooms for newspapers as distinct from magazines. The concentration of a reader's attention is much influenced by his environment when studying, by his being surrounded by a relatively restricted space, to say nothing about draughts and the difficulties of heating, which already are sufficiently complicated and troublesome. Mr. Cox has mentioned the essential differences of the open access-library as contrasted with the indicator system—a very crucial point of the utmost consequence. He has by way of detail suggested, however, that the reference-room entrance should be behind or within the lending library counter. This plan, I think, is open to the objection that when the issue of books closes on certain evenings of the week, no one would be able to use the reference-room without exposing the stack-room to intrusion, and it is most desirable to keep the reference-room always open for access to directories and other reference books, usually kept in these apartments, and, of course, for reading the heavier monthlies and quarterlies. As to the further observation about permitting the reference-room readers to have a table in the lending library stack-room, and group the bookcases suitable for the purpose, it would be hardly possible to discuss that point without opening up the whole question of library administration, which, to a considerable degree, must depend on the burning question of rate-aid *v.* State-aid, and it also touches the crying need of reference-room development. To-night we have, perhaps, wisely omitted such matters, though had I not been limited, as already mentioned, I would rather have considered the problem of the library in a broader sense than has now been possible.

Mr. H. T. HARE said the subject which they were discussing was of very great interest, dealing with one of the commonest class of buildings erected in recent years. Almost every town of importance had a free library, and those that did not possess one were ready to procure it through the generosity of some individual. Although the free library was an extremely simple building to design, one of the simplest an architect could deal with, yet it was one of the most difficult to plan successfully. He was inclined to question whether given an absolutely free site it was possible to get a perfect plan, one that would meet the whole of the requirements in a thoroughly satisfactory way. The first necessity for a free library was proper supervision. There was some confusion generally as to how the supervision was to be obtained, it being the common idea that the staff would exercise all control, and in many plans of libraries they could see the public rooms were grouped round the lending department. As a matter of fact, in most libraries the porter was the man who exercised the real supervision of the public rooms. The staff were generally kept busy in other duties, and they might also resent duties of such a character as could be left to the porter. Mr. Cox in his paper made a very slight suggestion about throwing all the rooms into one. There was a great deal more in such a plan than was mentioned in the paper. The solution of the whole question would be to have one great hall, putting all departments into it. There seemed no necessity for an entrance lobby at all in such buildings, and visitors might enter direct from the street. With regard to the lending library, the speaker did not think it was necessary to place it upon the ground-floor. It was only on

certain days of the week or in certain hours that any large number of people went to the lending department, and there was no objection to having it on the upper floor, but there were many advantages. If the reference library had to be placed upstairs, and if the lending department was arranged on the same floor, all the books could be kept together, and the same staff might manage the two rooms. The only difficulty was to get rid of the staircase, and that was a serious one in a free library of more than one floor, but it might be done. With regard to the external treatment, Mr. Hare agreed with the views expressed in the paper that the more simply such a building was treated the better it suited its purpose, yet it ought to have the appearance of a public building, and not that of a domestic one. In conclusion, the speaker moved a hearty vote of thanks to Mr. Cox for his paper, and to Mr. Adams for his supplementary notes on the subject.

Mr. S. D. ADSHEAD, who seconded the motion, said he would have liked to have heard more about the relative merits of the open access and the indicator systems. In his opinion the indicator system was the best, but in theory the open access seemed to be regarded as the best, although it was not in favour with librarians, since greater supervision was necessary. In districts where the population was poor it might not be workable, and the books would certainly be open to great risk of being damaged. Taken generally there were two distinct ideas prevalent as to the planning of small libraries; the one was the older system in which all the departments were divided by solid walls, and the new system which threw the whole building under one ceiling—the latter perhaps offered the greater advantages. With regard to lavatory accommodation the paper held that it depended upon the size of the library, but the necessity for such conveniences depended rather upon the position of the library in the town and the class of reader using the library. He believed in simplicity of plan for a building of this type, and urged that when an entrance hall formed part of the design it should not be sacrificed to architectural effect. The reading-rooms should be very refined, in true proportion and extremely unobtrusive, and no doubt a very good test of the architect's success in a library would be the absence of any particular style that could hold the reader's attention.

Mr. S. K. GREENSLADE pointed out the differences that existed between English and American systems in libraries. In America, he said, they knew how to treat books, and although the public were allowed to go to the "stacks" the books apparently were not stolen. They made, too, a special feature of the children's room, and the visitors went there for the purpose of reading, and they did not cheek the attendants. In regard to architectural design, a library could not be mistaken in America; they were buildings scholarly and very monumental, and the majority of them having been built from funds left by wealthy people, nothing was spared in the erection of them. The reading-rooms of a great number of American libraries were upstairs; the exception to such a plan was found in some of the university libraries and the great national library at Washington. It was at Washington that the first attempt was made for the storage of books on anything like a monumental scale, there being accommodation for some three million volumes. The framing of the stacks was in iron, very well designed, and the edges being rounded, there was little chance of damaging the books. Compared to America, London was very badly off from the students' point of view. At Boston any one could go to the library and see any book, and there were facilities for quiet study in the building. There were no such opportunities for men in London, and the speaker hoped the Government would soon settle whether the British Museum was to be a library or a museum. He ventured to think that in establishing a national library we should endeavour to build one on the same scale as that which existed at Washington. He finally advised men, if they desired to know what a library building was, not to look at examples in England, but to learn what had been done in America.

Mr. A. S. TAYLER suggested that a librarian's views on planning might aid the architect in designing a building to be used as a free library.

Mr. A. KEEN said in respect of the question of lighting libraries he had been struck with the fact that people got in each other's light very much in the open access system. In top lighting that objection would disappear. Sir John Soane had used such lights in his buildings always with good effect. The results were obtained, not by skylights,

but by lantern-lights, and it was this principle that might be adopted in libraries.

The PRESIDENT briefly concluded the discussion, and the meeting then terminated.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. John Belcher, A.R.A., president, in the chair.

Messrs. C. H. Brodie, G. A. Humphreys, W. T. Lockwood, A. E. Powles and E. R. E. Sutton were elected Fellows.

The decease of the following members was announced:—Mr. A. E. Perkins, Fellow, elected 1904; Mr. J. T. Wimperis, Fellow, elected 1877; and Mr. A. C. Wissenden, Associate, elected 1883.

The discussion was resumed on "Building By-laws, Specially in Rural Districts."

Mr. LACY W. RIDGE said they all knew and were agreed that something ought to be done with regard to improving rural by-laws. A remedy was necessary, and he suggested that the Local Government Board should obtain statutory powers from Parliament in order that they might reform those at present in operation. The Local Government Board should then bring forward by-laws for which they were responsible, and which could be enforced by the various authorities. With a view to such reform he submitted the following resolution:—"That in the opinion of this meeting it is desirable that the Local Government Board should obtain Parliamentary powers to enable it to reform the by-laws now in force in rural districts, and in our smaller towns, with a view to the enactment of such by-laws and such by-laws only as are really required in the public interest."

Mr. E. T. HALL seconded the resolution, and said they had all been interested in listening to Mr. Ridge's paper at the last meeting. They sympathised with it from beginning to end. The rural by-laws at present were only suitable to urban districts, and instead of helping building in some places, the by-laws retarded it. They felt, therefore, that the Government ought and would listen with respect to views which comprised the improvement of dwellings for rural labourers. Mr. Ridge had suggested that the Local Government Board had not power to rescind laws to which their approval had already been given, but the speaker thought that if the Board saw their way to adopt the resolution they would be enabled to recast the whole code of by-laws. Architects did not wish to deal with the local authorities as though they were hostile authorities. Their desire was to get the governing bodies to look at the architect's work from a broader point of view. One object of the architects was to save their clients the expense of the drafting of elaborate plans and the delay entailed by submitting drawings. It would be quite reasonable for the authorities to cause block plans to be submitted when several dwellings were to be erected showing how the buildings were placed, but in other cases there was seldom a need for detailed particulars. Factories and assembly halls could be regarded in a different light, and the local authority might claim power in the interest of public safety. On the broad lines of the by-laws proposed by Mr. Ridge reasonable latitude was given to the architect, and if the Local Government Board could get the powers to reform the present state of affairs, the great difficulty of housing the rural population would be overcome.

Mr. RIDGE said his by-laws were put forward as mere indications only of the line reform might take. He had stated in his paper that many points needed discussion and the by-laws should be technically drafted by a specialist.

The motion, being put to the meeting, was carried unanimously.

Among those who contributed to the discussion were Messrs. G. Bertram Bulmer, S. W. Cranfield, J. Douglass Mathews, G. A. T. Middleton, C. H. Brodie, W. Woodward, E. W. Hudson, H. H. Langston, B. Dicksee, and W. H. Atkin Berry.

Cambridge University appealed against the assessment of the Sedgwick Geological Museum. The point at issue was whether specimen cases could be assessed and the building should be specially treated as a memorial. The University, who appealed, secured a reduction of 300*l.*, and the town was ordered to pay the costs.

INSTITUTION OF CIVIL ENGINEERS.

ON Tuesday at a meeting of the Institution of Civil Engineers, Sir William White gave an account of the visit paid to the United States and Canada by the Institution last year during his term of office as President.

Sir William White explained that his paper had been prepared by the wish of the President and Council, who desired that the proceedings should contain a record of a visit paid to America for the first time in the history of the Institution by a representative body of its members. The American Society of Civil Engineers invited the members of the Institution visiting America to attend the International Engineering Congress which it organised at St. Louis in connection with the Exposition, and the Western Society of Civil Engineers, whose headquarters were at Chicago, desired that at least a brief stay in that city should form part of the itinerary. The final result of all these kindly suggestions was that the party, which mustered in New York to the number of seventy-two, exclusive of many ladies, had to face a hard month's work in order to fulfil numerous engagements at places far distant from each other, and to inspect many important works.

The first reception of the party by the American Society took place on September 13. New York and its surrounding districts constituted a great field for engineering operations of the most varied character; indeed, unless engineers had provided means for rapid transit—bridges, tunnels, road and railway communications—deep water approaches to the harbour, berths and warehouses for shipping, great steam ferries plying across the noble rivers, telegraphs and telephones, the great buildings styled "sky-scrapers," which were really gigantic engineering structures with an architectural disguise, adequate water supply and great sewage systems, the wonderful developments in "Greater New York" during recent years could never have been made. The opportunity of inspecting a number of the largest high buildings, some in course of construction, was the more valuable in view of the growing adoption of steel structures for building purposes in this country, and it was satisfactory to note that in the production of special sections of steel joists and girders suitable for such buildings the most recently designed British steel works compared favourably with those of the United States. In both countries built-up sections were giving place to rolled sections, and in both countries H-shaped joists up to 2 feet in depth were now obtainable in the greatest lengths required for buildings. The spectacle presented by the sky-scrapers from the harbour of New York was remarkable and interesting, but, in spite of their advantages in concentrating business, he was personally not desirous of seeing a similar group of buildings in any city of Great Britain. In Chicago, the birth-place of the sky-scraper, a law had been passed limiting the height of new buildings to 150 feet, and that example would probably be followed elsewhere. In New York, south of Fifty-ninth Street, there were 250 buildings of ten storeys or more, which had cost on an average 200,000*l.* each, some of the largest representing 700,000*l.* to 800,000*l.* each.

On September 19 the party left New York by special train for Montreal, whence they went to Quebec, Ottawa, Toronto and Niagara, being everywhere cordially received and entertained, not only by local committees of the Canadian Society of Civil Engineers, but also by representative bodies who joined in welcoming them to Canada. No engineer visiting Canada could fail to be impressed by the enterprise and courage with which the Government and private associations were facing great schemes for the development of the Dominion's resources, the construction of a new transcontinental railway, the improvement of the water ways between the great lakes and the Atlantic, the fuller utilisation of numerous sources of water-power for industrial purposes, and the production of electrical power, &c.; and when it was remembered that the total population of Canada was only about 5½ millions of people, the scale and cost of these great engineering works seemed even more remarkable. The party were enabled to see some examples of the most characteristic features in these developments. At Quebec they saw the works in progress for the new railway bridge to be constructed on the cantilever principle, with a channel span of 1,800 feet (100 feet more than the Forth Bridge), containing a suspended span of 675 feet and two cantilever spans each of 562½ feet. Of the waterways they only got a glimpse, though they visited the Soulages canal, which was 14 miles long and had cost about 1,350,000*l.* for construc-

tion and equipment. Many opportunities were afforded to see examples of the utilisation of water-power, and no one could fail to realise the enormous possibilities of development in the pulp and paper industry, with cheap power and a good supply of labour. They were informed that within a few miles of Ottawa there was 200,000 horse-power of water-power and within a radius of 45 miles nearly a million horse-power. At Niagara on the Canadian side three new undertakings were being rapidly advanced, together giving over 400,000 horse-power, while a fourth would yield 40,000 horse-power. When these were completed the grand total of power derived from Niagara on both sides of the river would be about 700,000 horse-power. Two of the three big undertakings on the Canadian side were practically due to American capital and enterprise—a fact that did not redound to our credit in view of the enormous amount of British capital available for investment. The third was distinctively Canadian and was closely associated with Toronto. The capital of this company was 1½ million sterling, and its total development of power would be 125,000 horse-power; these figures gave some indication of the enormous expenditure required in the Niagara district to develop 700,000 horse-power.

Leaving Niagara Falls on September 27 the party reached Chicago by special train next morning and put in what was probably the two hardest days' work of their tour. Among many other things a visit was paid to the central station and tunnels of the Illinois Tunnel Company, now far advanced after many years' work and an expenditure said to reach four millions sterling. Its first concession was granted for accommodating the cables of an automatic telephone system, but the promoters soon came to the conclusion that the system of subways might also be used for handling freight by electric traction. Hence subways of small sectional area were formed at a moderate distance below the surface under all the principal streets of the business quarter, and by this means it was hoped that the overcrowded thoroughfares would be relieved of the heavier traffic. The South Chicago works of the Illinois Steel Company, covering over 300 acres and including the largest rolling-mill in the world, were also inspected, together with the great Chicago drainage canal which, though primarily designed for sanitary purposes, was now regarded as part of a grand scheme for a deep waterway from Lake Michigan to the Mississippi. The Chicago authorities claimed that notwithstanding the use of the canal (which is designed when completed to have a flow of 600,000 cubic feet a minute) for sewage purposes, it was in better condition hygienically than an ordinary river flowing through an inhabited country; but this opinion was not shared by the people of St. Louis, who were understood to have begun legal proceedings. The party arrived at St. Louis on September 30 and attended the International Engineering Congress which opened on the 3rd of the following month. The attendance (including ladies) at the Congress was 876, and of this total 92 were citizens of the British Empire, 73 coming from home and 19 from the Colonies and India. This large attendance of British subjects—76 per cent. greater than that of all other countries combined, apart from the United States—was highly appreciated by their American hosts. Throughout the meetings the greatest cordiality and good feeling prevailed, and though most of the British members had to leave earlier, Sir William White himself, at the request of the President and committee of the Congress, remained till the concluding meeting on October 8, which furnished the culminating expression of goodwill to the Institution of Civil Engineers from their American brethren.

In conclusion, Sir William White remarked that this visit would undoubtedly be of benefit to British engineering, since it included exceptional opportunities for obtaining particulars of the latest American and Canadian practice. But beyond that, the close association and friendly intercourse that were maintained could not but have beneficial effects of a far-reaching character. The visit must tend to strengthen the friendly feeling already existing between the United States and the British Empire, and must result in a better understanding between the Mother Country and Canada, whose loyalty to the British Empire was undoubted and had been established by noble deeds. The development of the Dominion was in an early stage, but those charged with the responsibility of Government were fully alive to the grandeur of its resources and its potential greatness. The realisation of this policy depended largely upon the execution of engineering works of enormous magnitude. Those who took part in this visit had but a

glimpse of what was being done to utilise the natural advantages of the country, but enough was seen to make it certain that in Canada was to be found a splendid field for British enterprise and capital. Canadian engineers without exception expressed the hope that in the organisation and conduct of the great works now contemplated or to be undertaken hereafter they would have the assistance of British engineers, and especially of young engineers. No better school for aspirants in the profession could be found than that afforded by the Dominion. What was true of Canada was true also of our other colonies and dependencies, and it might be hoped that British enterprise and capital would be more devoted in the future to the development of the resources of the British Empire and less to corresponding work in foreign countries.

"THE LIGHT OF THE WORLD."

THE Secretary of State for the Colonies has addressed the following letter to the Right Hon. Charles Booth respecting Mr. Holman Hunt's painting:—

Colonial Office, Jan. 7.

Dear Mr. Booth,—I have heard with much pleasure of your intention to send first to Canada, and then to Australia, New Zealand and South Africa, Mr. Holman Hunt's fine reproduction of his great picture "The Light of the World." I understand that you propose to exhibit the picture freely in the central cities of the Colonies if space in public rooms is given by the authorities, or, if you have to hire rooms, to charge only so much for entrance as will meet the expense of such hiring, and that in any case you do not intend to derive any profit from the exhibition of the picture. I understand also that it is your intention to offer the picture on its return to England as a gift to the nation, to be placed permanently in some fit place. Your proposals seem to me to be eminently patriotic, and I feel the greatest sympathy with your desire to add to the ties which bind together the various populations of the self-governing States of the Empire that lofty bond of union which consists in a common admiration for great and elevating works of national and religious art.

I trust that the voyage of "The Light of the World" will be in every sense successful, and that you will find, as I do not doubt, that the local authorities will be most willing to do everything which can facilitate your laudable intentions.—I am, dear Mr. Booth, &c.,

ALFRED LYTTELTON.

The Right Hon. Charles Booth.

Ventilation and the Royal Victoria Hospital, Belfast.

SIR,—The statement made on page 4 of your issue of the 6th inst., respecting a discussion published during last year in the Journal of the Royal Institute of British Architects, and in which I was invited to take part, is calculated to convey an erroneous idea of the facts, and to suggest that I am unable to perceive merits in other than natural systems of ventilation. This is not so, and I have, after more than forty years' experience, formed a strong opinion in favour of the use of natural systems of ventilation in the case especially of asylums, workhouses and hospitals.

But the discussion has had its serious aspect, and the solicitors to the R.I.B.A., and to Messrs. Spottiswoode & Co., the printers of the Institute Journal, have seen fit to submit to me an expression of regret in respect of a paragraph reflecting upon me. This was accepted by me and duly published in the Journal, but as the authors of the paragraph have not withdrawn it, the matter is in the charge of my solicitors, as not only being libellous, but calculated to adversely affect the sale of my new book on the planning of hospitals, which I hope to see advertised shortly in your pages.—Yours faithfully,

GEORGE H. BIBBY.

69 Queen's Road, Twickenham, Middlesex:

January 9, 1905.

A Warning.

SIR,—It has been intimated that the authorities intend in the coming session to promote a Bill making an official system of land transfer compulsory for the whole country. I trust you will allow me to explain why it is of vital

importance to the public that such a measure should not pass. A brief reference to the history of the subject will tend to make the position clear.

Both Lord St. Leonards and Lord Cairns, the greatest conveyancing experts of the last century, were convinced that in view of the special conditions of land tenure in this country an official system (*i.e.* a system of registration of title) was not a suitable one here. Lord Cairns, indeed, was only converted to this view after recognising the failure of both the first Registration Act of 1862 and his own Act of 1875. His ripened experience led to his framing the Acts he passed in 1881, which practically revolutionised conveyancing by simplifying and shortening deeds and by limiting and adjusting costs on a moderate *ad valorem* scale basis.

In 1887 the present Lord Chancellor (the year following his appointment) introduced a Bill to in effect repeal Lord Cairns's 1881 Acts and to make an official system compulsory. The Bill did not pass, but in 1897 Parliament was induced to accept an Act professedly to try the experiment of making an official system compulsory in one county for three years.

London, having with the consent of its County Council been selected for the experiment, has had the system in operation since January 1899, a period of six years. The inquiry that was to have followed the three years' trial has not yet been held.

It is easy to prove that the official system is (1) terribly complicated; (2) costly; (3) continued in opposition to the views of everybody affected.

1. *Terribly Complicated.*—The system is based on the Act of 1875, the Act that Lord Cairns, its author, gave up as unworkable—as altered by the Act of 1897 and as supplemented by 371 rules and 72 forms. It is not necessary to go outside the judgment in 1903 of the Court of Appeal in the case of "Capital and Counties Bank *v.* Rhodes" to prove that the system creates something approaching chaos.

2. *Costly.*—The registry fees levied upon transactions for the year ending March 1904 amounted to 67,348*l.* This sum represents only a portion of the additional expense the system threw on purchasers and borrowers.

3. *The System is not Favoured by a Single Independent Conveyancing Expert.*—All the representative societies, including the Bankers' Institute, the Building Societies' Association and the Auctioneers' Institute, opposed its introduction in London. Resolutions have been passed at many public meetings urging the authorities to hold an inquiry. Last year the City Corporation and eighteen of the London borough councils petitioned with the same object.

If the official system is made general it is easy to show that (1) the expense to the public will be enormous, (2) that officialdom will be indefinitely extended.

(1) In 1900 Parliament voted 265,000*l.* public money for the erection in Lincoln's Inn Fields of a registry office for London. Every county will have an equal right to erect a registry office out of public money, involving an expenditure running into millions.

(2) In London the system employs over 240 officials. Many thousands will therefore be required for the whole country. It is difficult to say to what extent transactions in land will have to be taxed to pay the salaries, superannuations and other outgoings. The question also arises as to the expediency of placing such unlimited patronage in the hands of the authorities.

The authorities are fully alive to the absurdity of having an official system in operation in London and Lord Cairns's system in the rest of the country. At present any county council can adopt the official system, but all attempts hitherto made to induce the councils other than London to do so have signally failed. The authorities are now apparently bracing themselves to say that the counties must adopt the official system whether they like it or not. Parliament has, however, a voice in the matter, and it is to be fervently hoped short work will be made of the Bill if ever it should see the light.—I am, Sir, your obedient servant,
J. S. RUBINSTEIN.

5 Raymond Buildings, Gray's Inn, London, W.C.:

January 9, 1905.

The Surrey Education Committee have issued a set of post-cards illustrating the historical and otherwise notable places in the county. These will be given to scholars in the elementary schools in order to promote regular and punctual attendance.

GENERAL.

The Royal Scottish Academy met on the 5th inst. (Sir James Guthrie, P.R.S.A., presiding) for the purpose of determining as to which class of associates should be drawn upon to fill the three vacancies in the membership caused by the deaths of Mr. W. F. Vallance, painter, and Mr. D. W. Steyenson, sculptor, and by the resignation of Mr. John Honeyman, architect. It was decided, at the next meeting of the Academy a painter, sculptor and architect should be elected.

Mr. D. S. MacColl will begin on January 13 a course of lectures on "English Art from Constable to the Present Time," at University College, London. The course will deal with Wilkie, Watts, Madox Brown and the pre-Raphaelites, Burne-Jones, Morris, and Whistler. The lectures are open to the general public as well as to students on payment of the fee of one guinea.

The Dress Sword to be worn by M. Carolus-Duran as a member of the Institute is being provided by a subscription among the artists of the Champ de Mars, and will be chiselled by the sculptor M. Dampet. The decoration is of laurel leaves, with a painter's palette, surmounted by a sun, and the pommel consists of the classical head of Minerva, which is the badge of the Institute.

During Excavations recently in connection with the laying of foundations for a house in the Bauernmarkt of Vienna, the remains of a huge Roman cistern were discovered at a depth of about 20 feet. It had a diameter of about 10 feet, and the inner wall consisted of innumerable bricks of an extremely narrow shape, laid obliquely one upon the other. The find is unique of its kind, no cistern of a similar nature having as yet been discovered. It has been presented to the Vienna Museum, and is now being exhibited there, together with a photo showing the site in which it was found, and a number of Roman implements and fragments of pottery discovered at the same spot.

The Committee of the Institute of Archæology of Liverpool University have been enabled, by the munificence of Sir John Brunner, M.P., to take in hand the publication of a "History of Egypt," to include all the results of modern research, and to be, so far as possible, a complete history of the Egyptian civilisation from the earliest times down to the conquest by Alexander the Great. It is estimated that the work will take two years to complete, and it will be published with full photographic illustrations.

Commendatore Boni's appeal for photographs, drawings and other reproductions of monuments for the new Forum museum in the former Convent of Sta. Francesca Romana has met with ready responses from various parts of the world. Among the Englishmen, says the *Morning Post*, who have contributed towards the museum are Mr. H. E. Buxton, of Great Yarmouth, who has sent photographs of Roman remains in Suffolk, of the Roman aqueduct near Fréjus, and of the walls of Constantinople, and Mr. Thomas Ashby, jun., the archæologist, who has presented a large collection of photographs, including those of Caerwent, Silchester, and the Roman wall in the North of England.

The Edinburgh National Gallery has been bequeathed, by Mrs. Duncan J. Kay, of Drumpark, Dumfriesshire, the picture entitled "A Schule Skailin," by Sir George Harvey, P.R.S.A. The picture was painted in 1846.

The Powers signatory to The Hague Convention will be invited to appoint two architects from their respective subjects to compete for the selection of plans for Mr. Carnegie's Palace of Peace.

Some Typical Specimens of the 1,200 flint implements and relics from the recently discovered prehistoric Stone Age workshop in Dumfriesshire have, by request, been sent from the People's Palace, Glasgow, to London, that the members of the British Archæological Association and other interested bodies may have an opportunity of viewing the objects.

The United Free Church has unofficially offered to purchase the Synod Hall from the Edinburgh Town Council for 40,000*l.* Bailie Douglas, who stated in the Council Chambers that he was prepared with a cheque for that amount, had also a plan in his pocket showing how the Usher Hall could be built on a site facing the Lothian Road (by the purchase of the school, &c.), larger in area and more convenient of access.

Messrs. Blackwell & Thomson, architects, of Leicester and Kettering, have dissolved partnership, and in future Mr. Howard H. Thomson, A.R.I.B.A., will practise at the Leicester office, Halford Chambers, Halford Street.

The Ludlow Town Council, in view of the fact that the estimate for placing the equestrian statue offered by Captain Adrian Jones to the town in the suggested position in the town hall amounted to about 100*l.*, decided to decline the offer with thanks.

The Scenic Artists' Association are anxious to obtain for their exhibition at Grafton Galleries, Bond Street, W., April 10 to April 15, specimens of the works of Absalom, Bolena, Beverley, Bough, Chambers, Cox, Cooper, Calcott, Gates, Grieve, Hunt, Leitch, Loutherbouurg, Marinare, Mulready, Marshall, Nasmith, Roberts, Clarkson Stanfield, W. Telbin, and other deceased scene-painters, and the secretary, Mr. H. Lawrence Harris, is inviting owners to communicate with him at 5 Robert Street, Adelphi, W.C.

The Will of Thomas Craigie Glover, of 29 Hope Terrace, Edinburgh, Mount Grange and Earlsferry House, Elie, N.B., civil engineer and contractor, and a director of the Bengal Iron and Steel Co., Ltd., has been proved at 118,968*l.*

The Leighton House management committee appealed at the Clerkenwell Sessions on the 6th inst. against a general rate made on October 11 last by the Council of the Royal Borough of Kensington and the Churchwardens of the Parish of St. Mary Abbot's, Kensington. The appellants claimed to be exempt from rating altogether under the Scientific Societies Act on the ground that they were a society established for the purposes of science, literature, or the fine arts exclusively, but the Bench, at the close of a long inquiry, said the appellants had failed to make out their exemption. The appeal was therefore dismissed with costs.

Mr. Carnegie has given away 39,000,000 dols. for free libraries. These figures have been compiled by his private secretary, who was engaged upon the task for thirty days. Mr. Carnegie has given or has pledged to give 1,270 library buildings to the English-speaking race, including 779 to the United States. The actual cost of these buildings is 39,325,240 dols., of which about 30,000,000 dols. represents the share of the United States. 6,000,000 dols. has been expended in England, 2,000,000 dols. in Scotland, and 1,475,500 dols. in Canada.

The Triennial Competition for the Alexander Thomson Travelling Studentship is announced in Glasgow. The object of the scholarship, which was founded in 1880, is the furtherance of the study of ancient classic architecture prior to the third century of the Christian era. Competitors are required to be architectural students between the ages of eighteen and twenty-five, and to reside in the United Kingdom. They are asked to send to the trustees of the Alexander Thomson memorial (1) a study of a classic building, (2) a design for a cascade and portico in a public park. Two prizes are awarded, one of 60*l.* and a second of 20*l.* The competitor placed first is required to go on a sketching tour of three months in pursuit of his architectural studies, and the competitor placed second to spend three weeks in making drawings from the reproductions of classical buildings in the British Museum.

The Last Quarterly Statement of the Palestine Exploration Fund contains, among other matters, the tenth quarterly report on the excavation of Gezer by Mr. R. A. Stewart Macalister, in which there is a detailed explanation of the fragments of walls which at first appeared to Mr. Macalister to belong to crusading times. Further excavation has proved that the fragments form part of an extensive structure which was in all probability of the Maccabean period, if not earlier. An interesting feature of the excavation, says the report, was the discovery of a sherd of pottery of Cretan origin, and it is not the least important result of the Fund's excavations up to the present that several extremely important analogies between Cretan and Palestinian culture as exemplified at Gezer have been brought to light. The committee appeal for assistance in completing the excavations of Gezer thoroughly. The extension of time now granted by the Sultan would make this possible; but only if the force of workpeople can be increased, for which more money is necessary. Special donations are invited. An additional 1,000*l.* is required.

An Influential Committee of York gentlemen has been formed to promote an exhibition of old York views and portraits of local worthies, to be held in March and April, with the object of arousing interest in the preservation of the many ancient and picturesque buildings in and around the old city, and of illustrating the changes which have taken place in the streets, fortifications, &c., during the last two centuries.

The Exhibition of the Royal Scottish Academy will be opened on the 28th inst. Among the paintings will be examples by members and Associates who have died during the past year. These include Mr. James Archer, London, and Mr. Erskine Nicol (who were on the honorary retired list); Mr. W. F. Vallance, Mr. Arthur Melville and Mr. D. W. Stevenson, sculptor. Among loan pictures by honorary members of the Academy, one or two fine works by Israels have been secured, and Mr. Orchardson's large picture, *The Young Duke*, will be on view.

Sir William Emerson will act as assessor on the architects' plans for the new town hall and municipal offices, Wallasey. It is estimated that the scheme as a whole will cost 50,000*l.* Over 100 sets of plans have been sent in.

Mr. Thomas Fenwick, of the firm of Martin & Fenwick, civil engineers, Leeds, died on Tuesday at the age of eighty. From 1861, when he entered into partnership with the late Mr. S. S. Martin, he had been identified with the development of Leeds.

Mr. Hugh Stannus read a paper on Thursday, the 12th inst., before the Manchester Society of Architects on "Some Romanesque Examples in North Italy."

The Aberdeen Art Gallery, which has been undergoing considerable alteration and extension for some time, is to be formally opened on April 8, and Sir George Reid will perform the ceremony. The feature of the improvements will be the new Clark Sculpture Gallery.

The New French Embassy in Vienna has been commenced from the design by M. Chédanne, the architect to the Ministry of Foreign Affairs. The site selected is opposite the Schwartzenberg Palace.

"Old Cottages, Farmhouses, &c., of the Cotswold District" is the title of a work which Mr. Batsford is about to issue. It forms one of his series of volumes illustrating the cottage architecture of this country, and will contain 100 collotype plates from photographs taken by Mr. W. Galsworthy Davie. Mr. E. Guy Dawber has written an account of the architecture of the district, accompanied by numerous sketches and drawings.

A Competition has been arranged for the memorial of the late Professor Virchow in Berlin. The prizes offered are 3,000 marks, 2,000 marks and 1,000 marks. The site will be the present Karlsplatz, which, on the completion of the memorial, will be known as the Virchowplatz.

Mr. Francis William Bedford, architect, of 103 Barkstone Gardens, London, and of East Parade, Leeds, and 48 Prince's Street, Westminster, formerly of Mount House, Boston Spa, who died on December 2 last, aged thirty-seven years, son of the late Mr. James Bedford, of Woodhouse Cliff, Leeds, left estate of the gross value of 13,275*l.*

The Saxon Snell Prize was founded to encourage improvements in the construction or adaptation of sanitary appliances, and to be awarded by the Council of the Royal Sanitary Institute at intervals of three years, the funds being provided by a legacy bequeathed to the Institute for this purpose by Mr. Henry Saxon Snell. The first prize, which will consist of 50*l.* and a medal of the Institute, is offered in the present year for an essay on "Domestic Sanitary Appliances, with Suggestions for their Improvement." The essay is to consist of not more than 5,000 words and must be delivered on or before March 30. Two competitors of different professions or crafts may join in sending in an essay and plans.

The Glasgow Exhibition Committee held its final meeting on Monday, when it was reported that the balance of receipts over expenditure was more than 39,000*l.*, which will be available for distribution in aid of local institutions, though no allocation has yet been made.

The Memorial to the late Archbishop Temple in Canterbury Cathedral will be unveiled about the end of the present month. It takes the form of a bronze kneeling figure of the late Primate in his robes, holding a book in one hand, and is of heroic proportions, with a canopy supported at four corners by angels. The figure will be placed in the Corona (commonly called Becket's Crown), in a recess directly opposite the tomb of Cardinal Pole.

A New elementary school was opened on the 9th inst. at Malin Fridge, Sheffield. There are seven classrooms, light and airy, and the corridors on both the ground and upper floors have been made unusually wide. Accommodation has been provided for 800 scholars—the juniors and infants to occupy the ground floors, and the older children to use the upstairs rooms. The inclusive cost of building and site is about 16,000*l.* The architect was Mr. H. I. Potter, and Messrs. John Eshelby & Sons were the contractors.

The Architect.

THE WEEK.

THE death on Monday of EDWIN HENRY CORBOULD in his ninetieth year deprives England of an artist who was a link between the present and the past. He belonged to a family who long were associated with water-colour painting and illustrations. The late artist had gained reputation for both classes of work. His drawings were formerly attractions of the New Society of Water-Colours, and his illustrations in books and periodicals were among the best of the class. He was one of the representatives of water-colour art who were selected to uphold Great Britain in the International Exhibition of Paris in 1855. There his works were seen alongside of others by DAVID COX, CATTERMOLÉ, J. D. HARDING, J. F. LEWIS, WILLIAM HUNT, HENRY WARREN, FREDERICK TAYLER, &c. EDMUND ABOUT in his criticism of the collection remarked that Mr. CORBOULD aspired not only to give his water-colours the effects of oil-painting, but his drawings almost assumed the dimensions of historical paintings. The scene from MEYERBEER's opera "The Prophet," belonging to Queen VICTORIA, was said to be *un joli tour de force*. But what was the use of taking so much pains to do with water what could so easily be done with oil? MAXIME DU CAMP was less epigrammatic, for he described the drawing as a fine composition, full of action and grouped with ease. But *The Woman taken in Adultery*, which Prince ALBERT lent, was said to suffer through all the figures being English. A third drawing was *The Earl of Surrey by the aid of the Magic Mirror contemplating the Fair Geraldine*. Mr. CORBOULD was favoured with several commissions from the Royal Family, and he had the privilege of acting as drawing-master to the princes and princesses. Of late years his works were rarely seen in the Piccadilly galleries, but his name cannot be omitted from any history of water-colour art in England.

It would be interesting to discover when litigation over the Workmen's Compensation Act will be unnecessary. It is only by slow degrees and, as it were, by word after word that the Act will obtain definiteness. One important decision was given in the Court of Appeal on Tuesday. It was then discovered that the Act, although it says so much about scaffolding, is silent about the person who has to erect the scaffolding. The appeal arose out of a judgment in the Barnsley County Court. A workman was injured, but it was alleged that the scaffolding in question was not put up by his employer but by another contractor. The Judge considered that the man used it for his own convenience and that it was not necessary for the work on which he was engaged. It was therefore decided that the case did not come within the Workmen's Compensation Act. The Master of the Rolls referred to a case by which it would appear to be decided that a man who fell down a flight of stairs would be entitled to the benefit of the Act if there happened to be a scaffolding in the house. His Lordship said all the Act required was that a scaffolding was being used at the building when the accident occurred. The case therefore came within the provisions of the Act. Lord Justice COZENS-HARDY said that it should be understood that the workman would have been entitled to the same benefit if his employment was one which did not require him to use scaffolding, so long as scaffolding was being used on the building by another contractor.

It is a peculiarity of Ireland that private properties can be entered and materials removed for the repair of the neighbouring public roads. The custom is ancient, and although inconvenient in some cases, the sufferers, we suppose, look upon it as a payment of taxes in kind instead of in sterling coin. The control of counties and

the roads in them is no longer in the hands of grand juries. There are now county councils, and the representatives of the old system of government are not always disposed to facilitate the business of the new authorities. The county surveyor of Kilkenny was lately refused admission to a farm for the purpose of obtaining road materials on the ground that there was no evidence of a resolution having been passed which authorised the surveyor or other person to repair the roads. The objection was novel, and would have the effect of raising an obstacle to the repairs of roads throughout all the counties of Ireland. It was therefore brought before the judges of the King's Bench Division on Monday last. The Lord Chief Baron expressed the opinion that a county surveyor by virtue of his office was not authorised to enter on private property, or to ask the local magistrates to enable him to do so. He should be provided with a document showing that he possessed authority to repair the road, and that a resolution had been passed by the County Council entrusting the road to his charge. Owners and occupiers of land will not gain much by the decision of their lordships. But in Ireland there is respect for formalities, and on that account we suppose people will feel their grievances less acutely.

ONE of the last decrees which M. COMBES's Ministry, or rather his Minister of Fine Arts, was able to obtain related to the abbey of Mont St.-Michel. That noble collection of buildings, which is not only famous as a military monastery which could stand a siege, but as a surpassing example of the Benedictine type, is recognised as an historic monument. In that way it is brought under the control of the Minister of Fine Arts. But for some unknown reason one of the buildings known as the Tower of the Mill, or the Gabriel Tower, comes under the charge of the Minister of Public Works. There are consequently two rival authorities, and of course there is a risk that works might be carried out in the tower which would destroy the unity of the abbey. As it was necessary to have some repairs executed for the safety of the tower the wisest plan was to have them controlled by one of the architects of the Historic Monuments Commission. The Minister of Fine Arts seized the opportunity presented, and would not allow the work to be done until the tower was placed under the control of his Department. Henceforth it will be only reasonable to expect that the utmost care will be exercised over every part of the group. Having endured for so many years it would be a subject of regret that a fortified monastery of the character of Mont St.-Michel should suffer more from ill-regulated officialism than from any Norman foe.

THE decision of the Court of Appeal on Wednesday in *AYLWARD v. MATTHEWS* opens out a vista of a new and almost endless series of actions under the Workmen's Compensation Act. The plaintiff, a labourer, was injured while helping in erecting a timber platform to support a crane which was to be employed in hoisting materials for the erection of a school. Judge EMDEN, before whom the claim for compensation came, is an authority on building law, and he decided that the platform was a "building" and awarded compensation. The contractor appealed but was unsuccessful. The Master of the Rolls asked:—How could they say as a matter of law that a temporary wooden structure erected for the purpose of carrying a crane was not a "building"? Suppose that a permanent structure were built of brick or stone for the purpose of carrying a crane, it could not be said that it was not a "building" within the Act. The only difference between the two structures was that one was constructed of wood and the other of brick or stone. Lord Justice MATHEW considered the structure was carefully constructed, and it came within the Act, although it served a temporary purpose. By the decision of the Court it will be henceforth difficult to say what is not a building.

PORTLAND CEMENT.

NATURE has set the example of the employment of cements. Economy is recognised as a law, and consequently a great many fragments which might have as little cohesion as the unnumbered pebbles over which the sea breaks are often united into a comparatively solid mass by means of carbonate of lime, silica, oxide of iron, &c. This cohesion varies, for sometimes the mass may be difficult to separate, while in another case the elements are easily overcome. The adhesiveness depends, of course, on the quality of the binding material. But under the most favourable circumstances a conglomerate is partly a mechanical and partly a chemical mixture, and it is through the chemical action that strength is obtained.

It took a long time before it was realised that in making a cement what has to be sought after is not merely the combination of particles of limestone and particles of clay, but such an amalgamation between them as can only be accomplished by fusion. There are no doubt in the market various mixtures which are described as natural cements. But the phrase is one requiring explanation. Whatever strength might exist in bodies which are said to be cemented by nature they are not to be found in sufficient quantities for a marketable product, for the removal of the lime or silica would be a tedious process. The American natural cements have to be burned and ground like ordinary Portland. The only advantage is that in Rosendale, Utica and Milwaukee beds of rock exist in which carbonate of lime, carbonate of magnesia and alumina are combined. It may as well be admitted that natural substances have always limitations, and it has been for several years doubted in America whether for general use a natural cement is as efficient as ordinary Portland cement. The advantage of the latter is that it can be adapted to requirements, or in other words made to correspond with the conditions of a specification. That is a peculiarity which distinguishes cement. Iron and steel are also manufactured products, but no process has yet been discovered which will increase their tensile, compressive or torsional strength beyond a general average. Cast-iron, as we all know, is practically incompressible. But some of that quality might often be sacrificed if its resistance to tension could be increased.

The extraordinary experiments which were made by Mr. JAMES GRANT when the main drainage works of the Metropolis were in course of construction, seemed to indicate that the characteristics of Portland cement could be varied to a remarkable extent. Previously it was considered that a breaking strength of about 130 lbs. per square inch was adequate, and evidence of a strong Portland cement. When, therefore, a strength of 178 lbs. per square inch was specified for the main drainage works an unusually high standard had been adopted. But in a long course of experimenting Mr. GRANT found that after seven days an ultimate strength of over 800 lbs. per square inch was possible, and that the average was $358\frac{1}{2}$ lbs. per square inch. The specified strength was therefore increased. The new conditions were that "the whole of the cement shall be Portland cement of the very best quality, ground extremely fine, weighing not less than 112 lbs. to the struck bushel, and capable of maintaining a breaking weight of 350 lbs. per square inch seven days after being made in a mould and immersed in water during the interval of seven days." In engineering works elsewhere in England a still higher standard was adopted, while in other places a breaking strength of a lower degree was accepted.

The degree of fineness also varied. A mesh of 50 in an inch or 2,500 in a square inch, was by some considered to be as much as is necessary for all practical purposes. But 76 meshes per lineal inch or 5,800 per square inch were subsequently adopted. The United States Corps of Engineers insist that at least 92 per cent. of the cement shall pass a sieve of 10,000 meshes

to the square inch. It is said that test is not considered excessive. German cement is still finer.

When there is uncertainty about the strength which will be demanded it cannot be expected that the production of cement will always be conducted on the most economical conditions. Some employers of the material desire the utmost fineness, others are satisfied with a comparatively coarse cement. One engineer may think 250 lbs. per square inch is a test far beyond what is needed in actual work. Another holds 500 lbs. is the least which should be adopted. The adoption of a standard which will generally be accepted is therefore a desideratum. The Engineering Standards Committee have endeavoured to supply the want. In considering their specification the variety of opinions on the subject should be taken into account.

The constituents of the cement are not attempted to be fixed. All that is said is:—"The cement shall be prepared by intimately mixing together calcareous and argillaceous materials, burning them at a clinkering temperature and grinding the resulting clinker." Silica, oxide of iron, alkalies can be introduced at the maker's discretion. There is to be no excess of lime and the insoluble residue is not to exceed 1.5 per cent. If, however, "calcium sulphate is used, not more than 2 per cent., calculated as anhydrous calcium sulphate, of the weight of the cement shall be added."

The tests generally applied are mechanical rather than chemical. Samples required for testing are to be taken from at least twelve different positions in the same heap, and if desired they can be obtained at the manufacturer's works. As regards fineness, a high standard is adopted, viz.:—"The cement shall be ground to comply with the following degrees of fineness, viz.:—The residue on a sieve $76 \times 76 = 5,776$ meshes per square inch shall not exceed 3 per cent. The residue on a sieve $180 \times 180 = 32,400$ meshes per square inch shall not exceed $22\frac{1}{2}$ per cent." The briquettes differ slightly in form from those commonly used, being 3 inches in height, an inch at the waist and $1\frac{3}{4}$ inch at the widest part. The briquette is to be kept in a damp atmosphere for 24 hours after gauging, and then to be placed in fresh water which will be changed every seven days until required for breaking. Six briquettes are to be broke at seven and six at twenty-eight days, and the average tensile strength is to be accepted. The seven-day briquettes must bear a tensile stress of 400 lbs. per square inch of section before breaking, while for those that are twenty-eight days old the stress will be 500 lbs. per square inch. Cement is rarely employed neat, and it is therefore advantageous to test a mixture of cement and sand. Briquettes of similar form are to be made of one part cement to three parts of dry sand. At seven days from gauging these have to bear a stress of 120 lbs. per square inch, and at twenty-eight days one of 225 lbs. per square inch. This nearly corresponds with the American standard for seven-day briquettes of one part cement and three parts sand, which are to have a strength of from 100 to 140 lbs., and at twenty-eight days 200 to 300 lbs. Three gradations of setting are recognised—quick, medium and slow.

Another test which was unknown to early experimenters is that of M. LE CHATELIER. The mould is placed between two plates of glass and is put in water at a temperature of from 58 degs. to 64 degs. Fahr., where it remains for twenty-four hours. After being removed to cold water, boiling is employed for about six hours. The dimensions are then carefully measured by a special apparatus, and if the expansion exceeds the specified limits the cement is rejected.

We have only indicated the general bearings of the new standard. It will be seen that, although uniformity is sought after, the quality of the cement which is specified will be sufficient to satisfy exacting requirements. Indeed, some makers may consider that the standard is unnecessarily high; but on the whole both buyers and makers have reason to be satisfied. The

other standards have already proved their utility, and in the case of cement we hope the labours of the committee will extend the use of Portland of British manufacture instead of foreign mixtures which are dangerous.

IRISH CASTLES.*

THACKERAY often amused his readers by describing and exaggerating the foible of Irishmen in conferring sonorous names on their houses. Irish grandiloquence, he says in one place, displays itself finely in the invention of such names, and, to the great inconvenience of the postman, the names of the houses appear to change with the tenants. A weakness of that kind is not peculiar to Ireland, for it displays itself in the suburbs of large and small towns in England. The builders might have vocabularies of pet names in French, German, Spanish and English always ready for selection. It becomes more remarkable still in sea-side resorts, for visitors desire to be able to give pretentious addresses when writing to their friends, although the place may be no more fashionable than Ramsgate or Margate, and the lodging-house in a back street. THACKERAY still less approved when a man's name was imparted in some way to his house. The good-natured Mrs. O'Dowd was always boasting of the magnificence of O'Dowdstown, her brother-in-law's abode, or her cousin DAN MALONEY's place, Ballymaloney. PENDENNIS was at one time very proud of the possibility of becoming the son-in-law of Captain J. CHESTERFIELD COSTIGAN, of Costiganstown. As for The MULLIGAN of Ballymulligan, who dare deny that the Saxon quailed before the war cry of the house in a hundred thousand battles? But the Irish are not the only offenders. According to SCOTT, nothing sounds more agreeable to a Scottish proprietor than to call him by his territorial epithet. A little deeper acquaintance with Ireland would have convinced THACKERAY that the nomenclature was not so absurd as he imagined. Ireland is divided into divisions known as "townlands," of which the origin is uncertain. They all bear names, some of which are in Irish and are suggestive of the peculiarities of the fields. Other townlands are distinguished by family names, including those of Englishmen who arrived at a comparatively late period in the island. The adjoining townland to O'Dowdstown might be Simpsonstown or Jenkinstown. In neither case would a large number of streets or buildings be suggested, for "town" is simply an abbreviation of "townland," and many hundreds of the divisions are without a house.

The practice of calling a very simple and it may be dilapidated house a "castle" may sometimes have arisen out of ostentation or a desire to deceive strangers. But there is no doubt that local conditions have had much to do with the title. Castles, meaning by the word fortified buildings, at one time were to be met with throughout Ireland. In proportion to the area of the country they were likely to be more often found than in England. THACKERAY was able at one moment to see three in a line. Ireland was always in a disturbed state, and a strong building of masonry was an absolute necessity for the safety of a chief and his family, as well as for his immediate retainers. Only in the Border region of England and Scotland existed an equal call for structures that could not be easily captured or destroyed by fire. The lament of the Border Chief in the old ballad—

They burnt my little lonely tower!
The fiends confound their souls therefor;
It hadn't been burnt five years or more!

might be employed in many districts of Ireland during centuries. The quantity of ruins of those old dwellings which are to be found in Ireland is a continual surprise to an English visitor. But if tradition can be trusted, those which survive are insignificant if compared with the buildings which formerly existed. In the volume

on the "Castles of Ireland," which has recently appeared, we are told:—

These castles range in dimensions from the few blocks of protruding masonry on the green sward, which mark the foundation of a ruined peel tower, or the scarcely traceable line of wall which was once a fortified bawn, to the majestic ruins of castles like Adare, with its three distinct and separate fortifications one within the other, or royal Trim, deemed strong enough to be a prison for English princes. Yet in the majority of cases little or nothing is known locally about the builders, owners or destroyers who have left us these picturesque, if somewhat sad, mementoes of their warfaring existence. Three items of information will in all probability be supplied to the inquirer—that they were built by King John, occupied by the Geraldines, and demolished by King John in person; and, indeed, if the hill from which the bombardment was carried out is not shown to the stranger his informant is lacking in the general art of story-telling. In some cases the origin of the castles is boldly attributed by tradition to the Danes, thereby unconsciously introducing the much wider controversy as to whether such stone fortresses were known in Ireland before the landing of the Normans at Wexford in 1169. Be this as it may, it was only subsequent to this date that they were built in any number. Both invaders and invaded relied chiefly on these strongholds for obtaining supremacy in their constant struggles. Grants of land were generally given with the condition of erecting a fortified residence. It was only when the introduction of gunpowder rendered such buildings untenable in war that they were very generally deserted for more comfortable dwellings, and jackdaws alone keep watch to-day from many a crumbling battlement that once echoed a sentinel's tread, and bovine heads protrude from the doorways from which mailed knights rode forth to battle.

It is allowable if a fragment of an ancient wall is to be found on his land for an owner to call his residence by the same name as the old building. Tribal names abound in Ireland, and a very humble member of the BARRYS would not commit a grievous offence if he called his new house "Castle Barry," or "Barryville," like the two houses in which BARRY LYNDON lived in his youth.

We need not, however, trouble ourselves about the social problems which are connected with the question of names in Ireland. In an architectural sense the buildings themselves are of greater importance. In considering castles, or, indeed, any class of buildings, one of the first processes which should be adopted is to imitate the example of the naturalist and divide them into classes and sub-classes, as if there were species and genera among them. That has been done to some extent in England, but although Ireland possesses many retired soldiers and military engineers with practical experience of fortification, no systematic arrangement of the old castles appears to have been attempted. We may look upon one of the ruins as an indispensable feature in an Irish landscape, but there are more differences among them than among the round towers. For instance, PETRIE tells us that the first Scotch settlers in the country adopted the type of keep or castle turreted at the angles and surrounded by a bawn or outer wall enclosing a courtyard. But in others of the northern castles circular towers are to be found at no more than two of the angles. The castle of Donegal is, however, suggestive of buildings in Scotland, although constructed prior to the "Confiscation of Ulster." The lower part presents few openings to an enemy, while the ornamental windows suggest that the family lived near the roof, where the principal chambers must have been arranged. Now there is a record that the building was erected in 1474 by HUGH ROE O'DONNELL, who died in 1505. But, as PETRIE remarks, "the existing ruins retain no feature of a castle of the fifteenth century, but, on the contrary, are in every respect characteristic of the castellated residence of the reign of JAMES I." How is the anomaly to be explained? It is worth noting that Donegal Castle was not ruined by enemies, but by the act of the owner, HUGH O'DONNELL, who at

* *The Ancient Castles of Ireland: Some Fortress Histories and Legends.* By C. L. Adams. (London: Elliot Stock.)

the beginning of the seventeenth century, having failed in his contests with the English troops, became an exile, and before leaving partly destroyed his castle. "Dun-na-Gall" means the foreigners' fort, and the chief resolved it should never in spite of the name belong to a stranger. The destruction was made the subject of a long poem in which the difficulty of dealing with building terms was encountered, but not with more success than appears in modern poems. In Antrim Castle, the residence of Lord MASSARENE, we see the northern type transformed, and the parts which used to be most essential converted into ornamental features. The gate-house is Tudor in style, and is or was closed by folding doors of cast-iron only to be opened by the aid of machinery. The turrets become square towers, but the angles of them are treated as thin circular towers. From the medallions of CHARLES I. and CHARLES II. in the front it is evident the building must have been erected after 1660, when the owner was created a peer. Antrim Castle is like several others in Ireland in which the work of different periods is preserved or imitated, and which consequently renders identification difficult.

It is well for anyone who studies the castles in the North of Ireland to remember that six of the nine counties in Ulster were, in consequence of the rebellion of the O'NEILLS and O'DONNELLS, escheated to the Crown. It was resolved to divide the land among English and Scottish tenants. Defensive buildings or castles had to be erected. Every undertaker who obtained 2,000 acres was within two years to construct a castle with a strong court or bawn about it. If he obtained 1,500 acres he was to build a stone or brick house with a strong court or bawn. If only 1,000 acres were granted a castle or house was not requisite, but there had to be a strong court or bawn at least. The undertakers further guaranteed that their tenants should build houses for themselves and their families near the principal castle, house or bawn, for their mutual defence or strength. In that way the connection of the companies of London with the North of Ireland commenced. As was to be expected there was a general resemblance between the character of the castles.

Near Dublin there are two castles still occupied which offer examples of work of very different periods. One is Malahide Castle. RICHARD TALBOT accompanied HENRY II. to Ireland and received the lands of Malahide. In the eighteenth century the building was said to have lost its original castellated character, although the original moat remained. The probability is the castle was judged by the notions of the time about what was suitable, and as the castellation was not considered sufficiently emphatic, it was improved into a more appropriate form. The moat was filled with earth and planted, the ancient drawbridge was removed, and the building was flanked by towers. The castle is greatly admired, but if tested by an archaeological standard it can only be regarded as an eighteenth-century structure. Another of the early invaders was Sir AMORICUS TRISTRAM, who acquired the lordship of Howth. He adopted the title of St. LAURENCE as a surname, because the battle he fought on landing, and in which he was victorious, was on the Saint's day. The family remained at Howth. In 1564 the twentieth Lord HOWTH is believed to have erected the present mansion, which is a curious compound of styles. It is not likely that all traces of antiquity were cleared away before the new work was commenced, and careful investigation would no doubt be able to identify much which was prior in date to the sixteenth century. With the new buildings a new system was introduced in Howth Castle. An Irish noble or chief was expected to be as remarkable for hospitality as for fighting. There is enough written evidence to prove that they kept open house for all who called upon them. Visitors accompanied by an army of retainers would call uninvited on their friends and remain with them for days or weeks according to

circumstances. Lord HOWTH closed the gates of his new mansion at dinner time. This enabled GRACE O'MALLEY to carry off the heir, who was found playing on the shore, and she retained him in her castle on Clare Island, off the west coast, until it was agreed that the gates should be left open ever afterwards. "The Dark Lady of Doona" is supposed to have participated in piracy, and it is not impossible that when the boy was returned a large sum of money was paid for his freedom.

A question must arise in respect of the hospitality concerning the arrangements which had to be made to accommodate a large company of guests. They were usually equestrians, and provision was required for horses as well as men. The seneschal of the owner of a fertile territory would no doubt be able to insist on the supply by the vassals of an abundance of food. But where were the rooms and stables? Judging by such ruins as remain the builders did not provide for unlimited guests, and we must therefore conclude that around all the important castles there were wooden structures which would serve on occasions when large numbers arrived. We suppose some would be accepted in the nearest abbey, and others would be billeted on adherents, but the majority would, of course, prefer the luxuries of the castle.

A type which appears to be almost unique is seen at Rاندown in the county of Roscommon. It was in the territory of the O'CONNORS, and as that tribe was always at war either with neighbouring tribes or among themselves, the site of the castle was seized by EDWARD I. in the thirteenth century, and a castle or big police-station was erected. Master RICO was the carpenter, and RICHARD DEMARISCO appears to have been master of works. According to WELD it was intended partly for the protection of boats sailing on Lough Ree. The plan of the castle nearly resembled the letter P. There was a spacious apartment for banqueting assemblies, or more likely for trials. Prior to the invention of gunpowder Rاندown Castle must have been considered impregnable.

What is desirable is a work which will treat of the planning and construction of the Irish castles as far as can be discovered from the remains and the allusions in various records. But still more interesting and valuable would be one treating of Irish habitations in general. We can infer many things from the ruins of the castles, and must come to the conclusion that in the majority of cases they were more uncomfortable residences than the modern County Council lodging-houses. We have at the other extreme the Irish cabins which, as MOORE declared in his "History of Ireland," corresponded with the dwellings of the humbler classes 2,000 years ago. Where, however, were the dwellings of the classes which intervened between the noble and the serf? In the capital it is doubtful whether there is a house of older date than the eighteenth century. In a majority of the towns a search for ancient Domestic architecture would go unrewarded. THACKERAY said that Galway was the only town in Ireland in which an antiquary would find subjects for study or a lover of the picturesque for using his pencil. There at least he could realise the character of the dwelling of a sixteenth-century merchant. In England it is possible to still find examples of the old habitations of several classes of inhabitants. Are we to suppose that all traces of contemporary life in Ireland were annihilated? Perhaps it was a belief that too much attention had been bestowed on one class which induced the Galway peasant mentioned in a communication in last week's *Architect* to turn the ruins of one of the castles of the DE BURGOS into a farm building. His conduct would be pleasing to practical men. But it reveals that the prose of the present is beginning to be preferred to the poetry of the past. He probably would reply to a critic of his conduct that the DE BURGOS cared little about their followers, and why should a BURKE look on one of the towers as a sacred thing?

As we have said, the castles of Ireland form a subject which is vast, diversified and intricate. They should either be treated exhaustively, as was at one time contemplated by the Ordnance authorities, or partially by representative specimens. In the volume by Miss C. L. ADAMS there are included between seventy and eighty castles. But we are afforded no clue to the principle adopted for the selection, and the arrangement is merely alphabetical. The histories and legends were naturally of more importance to the compiler than any study of the planning or building. It is undoubtedly a hard task to investigate any department of Irish history unless to a pronounced pessimist. Miss ADAMS has done her work with care; but what is needed is, as we have remarked, a work of a very different class, in which the relation between the social condition of each period and the buildings will be established. The book may serve to persuade some of the Irish archæologists to undertake the inquiries which are necessary.

RUSKIN COLLEGE, OXFORD.

RUSKIN COLLEGE, Oxford, has entered upon an important scheme of extension. It is proposed, says the *Manchester Guardian*, to erect new buildings which will form a worthy headquarters of the movement for the higher education of working men in the great University. A central site has been obtained in Walton Street, not far from Worcester College. Three thousand pounds—including donations from the Amalgamated Society of Engineers, the London Society of Compositors, and the Scottish Co-operative Wholesale Society—have been subscribed, and this amount has been spent in acquiring the site. Another 5,000*l.* is needed to alter, extend and furnish the buildings on the site so as to accommodate fifty students. A second 5,000*l.* would enable the Council to accommodate one hundred students. An appeal is now being made for money to enable the authorities of the college to go on with the much-needed development.

Ruskin College was founded in 1899 for the purpose of giving to working men who aim at making themselves useful to their fellows a thorough training in the great social and political problems of the day. It is a school in which those who may become future leaders of working-class opinion—either as trade-union officials, members of local governing bodies or members of Parliament—can be equipped for their work. Ruskin College has long outlived the early days of misrepresentation of its aims—days when it was possible for a few to describe it, according to their view, as “an educational sausage machine for the turning out of labour agitators,” and when *Punch's* Special Prophetic Interviewer could draw humorous pictures of labour undergraduates on strike. It has justified itself by a good deal of solid achievement. During the last five years nearly 200 students have resided at the college, the greater number for a year. With five exceptions all the students were members or officers of trade or labour societies. The value of the college has been realised by some at least of the great trade unions. For example, the 95,000 members of the Amalgamated Society of Engineers have made three levies of one penny each to help the work of the college, and grants have been made by numerous other trade unions and co-operative societies. The management of the college is in the hands of a Council composed of representatives of the Trade Unions Council, the London Trades Council, the Amalgamated Society of Engineers, the Co-operative Union, members of Oxford University, including Professor Henry Goudy and Sir William Markby, as well as the Rev. Dr. Paton, of Nottingham, Dean Kitchen, Mr. J. Keir Hardie, M.P., and other well-known leaders in education and labour matters.

For 1*l.* a week the Ruskin College student enjoys board, lodging and tuition. Life in the college is simple and strenuous—“plain living and high thinking” is the rule. The young aspiring working-man who comes up to Oxford finds himself, perhaps for the first time, in surroundings where there is the least coercion. He is a responsible student. He must observe, inquire, think. “Most of the domestic management of the college,” to quote an official publication, “is in the hands of the students. Each week they hold a house meeting and appoint their own officers. Each student passes in turn through the posts of official life. There are no servants except a cook, so that each

student by washing up or scrubbing floors learns how silly a thing is snobbery, and how exacting are the claims of household drudgery unless relieved by a simple life.” The courses of lectures, given by a qualified staff, cover such subjects as political economy, industrial history, the history of social movements, local government, sociology, psychology and logic, and there is a useful class for speaking and public work. Of course, the social life of the college has a great educational value. The men learn tolerance and width of mind by their free intercourse together. The college is “run” very much on the same lines as the Manchester Ruskin Hall before that small institution was merged in the University Settlement. In Manchester the educational side of the movement is being continued, the residential side of the work having lapsed. Many of the students who go to Oxford have to make a considerable sacrifice of time and money. During their residence they are without any income, and can only pay their fees by using the savings of years. Some students who are nominated by the big trade unions are supported at college by their organisations.

The work at Oxford is necessarily limited, but it is supplemented by a system of teaching by correspondence, which spreads its benefits irrespective of distance. By means of the correspondence school all who are interested in the problems of our own time are enabled to study the subjects taught at Ruskin College by home reading. The aim of this branch is to systematise reading, and to help the home student by arranging for him definite courses of study. The fee for membership is one shilling a month, and there are now over 500 students scattered “in factory towns, on distant moors, in every part of Great Britain, in Norway, Denmark, South Africa, India, Australia and New Zealand.” The subjects are akin to those taught in the college, and the aim is to set the student abreast of the modern current of knowledge. Special stress is laid on the constructive part of the students’ work. They are asked to write essays on given subjects, and to send them periodically to Oxford for criticism and correction. In some places the corresponding students form themselves into classes for the discussion of difficulties and the interchange of ideas.

ROYAL HIBERNIAN ACADEMY.

THE following statement respecting a modern art gallery was adopted at a meeting of the Council of the Royal Hibernian Academy on the 9th inst. :—

The Royal Hibernian Academy as representative of modern art and artists in Ireland has a primary interest in the project of a modern art gallery for Dublin, and especially in the consideration that the institutions of a permanent exhibition of modern pictures and of the annual or periodical exhibitions of modern art should be grouped. The Academy has accordingly cordially welcomed such a project, and freely lent its galleries and good-will for its promotion.

An exhibition of pictures has lately closed which was collected in its galleries, with its consent, by the energy and enthusiasm of Mr. Hugh P. Lane, and has been of a remarkable, interesting and educative character for Dublin. It has effected much to centre attention on art in Ireland, and arouse animation as to its existence and culture. This exhibition, however, in the Academy’s house was not under its auspices, as may not be generally known, nor had its members any part in its selection.

It has transpired in correspondence in the public Press that this valuable collection is derived mainly from two sources, that of pictures at present in the market from two vendors at a time when they were able considerably to lend them, viz. from the executors of the late Mr. Staats-Forbes, who are realising his estate, and from Messrs. Durand-Ruel, of Rue Lafitte, Paris. A value of about 35,000*l.* has been freely ascribed to the collection as a whole. It has been advocated by some enthusiastic persons that as a whole it should be secured for Dublin as the nucleus of its modern art collection, and that a fortunate chance of its acquirement on a moderate valuation if lost now could not occur again.

The circumstances of the time appear to have been unfavourable to the appearance of any munificent benefactor or benefactors to present such a sum at once, which otherwise it could not be expected would be realised. It is the function of the Royal Hibernian Academy, on behalf of the opinion of artists of Ireland, now to express it when it cannot be taken as inimical or obstructive to the gallery project.

The pictures presented in this exhibition, with few exceptions from two main sources, may be classed as follows:—

1. Pictures of high quality and value exemplary of great modern artists and desirable to be included in the nucleus of a great modern gallery.

2. Pictures which are examples by eminent artists of much charm in a passing exhibition, but to be regarded as not representative of any great artist at the full measure of his genius, but rather as souvenirs for the private collector.

3. Pictures of whatever value which would not in any respect be acceptable or educative to the public or artists in a pleasing or popular gallery, which if acquired would too early occupy undue space, and which it would not be judicious to accept even if generously offered as gifts.

The Council of the Royal Hibernian Academy as artists would accordingly appeal to those of the Irish public who have evinced a generous impulse to do a great service to art in Ireland, and make it a practicable one, that their contributions should be conditional on a more deliberative procedure that has been advocated by some writers in the Press. It urges that the selection of first pictures, which will be all important in a nucleus in proceeding to realisation of a popular gallery, should be those of pre-eminent and individual fame, selected under associated expert and independent advice with unhurried judgment and from wider fields than the sources of this exhibition.

It is to be added that in such deliberative selection it might be remembered that in the nucleus of an Irish permanent and popular gallery might be accorded with Irish favour some due representation at least of notable works of artists of Irish origin, a wide enough field of inquiry for which has been indicated in the successful Irish Guildhall Exhibition of 1904.

ART IN BIRMINGHAM.

IN his report as examiner on the work of the Vittoria Street school, Birmingham, for the year ended December 5, 1904, Mr. H. Wilson says:—"After a long and careful study of the work of the past year, it gives me great pleasure to say that I find a higher level of excellence is reached, not only by individual students, but by the whole school. There is in the handiwork evidence of a keener sense of the importance of finish, not as mere smoothness or polish, but that completeness which comes of clean workmanship and neatness of execution in all stages of the work; and in addition to this I found a greater appreciation of the beauty of metals in combination and more feeling for the colour values of materials employed. The hammerwork also is more sensitive and the forms more refined. The decoration of raised work by traced and dotted leafage in outline is an interesting departure which may lead to valuable results, while the increased attention given to inlay and damascening has produced some very good work full of promise for the future. I hope that many more students may take up these most beautiful branches of the jeweller's craft. There has been great improvement in the class for chipping; the forms are made out by the use of the chisels and the work left from the tool. The effect is thus in all cases far better than it was last year, and in one case the work is of remarkable excellence. It was with great satisfaction that I noted the large increase in the number of drawings from memory, and a more than corresponding improvement in the quality of the work. Some of the drawings are wholly admirable, and almost all are good in one way or another. The beneficial result of the more extended study from memory is very evident in the higher quality of the studies from living animals, and it would be difficult to praise too highly the efforts which have led to the beautiful series of drawings from feathers and some of the more advanced studies from animals and birds. The sight of all these gave me very great and very keen pleasure, which is renewed in the recollection of their many surprising qualities. The freshness of outlook, the vivacity of expression, the realisation more or less complete of superficial form and texture all go to prove that there are few, if any, who cannot draw if only they are not too much instructed. There is, I observe, a tendency on the part of some of the more advanced students to borrow the style and technique of their teachers instead of going on until each finds his own manner of drawing. This should be carefully guarded against, as it leads to the worst form of mannerism, to a parasitic style. The increased powers of realisation acquired by the study from memory and from living animals are, however, most strikingly shown in the

few drawings from the human model which were the latest, and I was much struck by the obvious pleasure which the authors of the drawings had taken in their work. The drawings are few in number, but of surprising accomplishment when the fact is remembered that none of the students had ever studied from the life before. Nevertheless, great watchfulness must be exercised lest, on the one hand, the work should become mannered, or, on the other hand, lest it should be unduly influenced by methods of work and vision which belong to another generation." The examiner makes a number of valuable suggestions, particularly in relation to anatomical modelling. He says:—"There should also be one or two skeletons of typical animals for the use of students and for demonstration purposes. The one thing in the work of this class which I felt to be the least satisfactory is the modelling from photographs; in other words, modelling in relief from a flat copy. Photographs have their uses as records, as stimulants of memory; but it is, I think, evident that form should be studied from form in the round, or at least from a memory of form. If studies have been made from the living animals beforehand, and the photograph is used to recall or amplify or supplement the original studies, its use might be perhaps justified; but otherwise it is a positive hindrance." Mr. Wilson congratulates the committee on the very admirable results of the past year's work, results which are so largely due to the energy, skill and untiring work of Mr. Gaskin and his staff of assistants. The school, he says, is daily becoming a centre of happiness in work, and work and happiness combined are the most potent of civilising and ennobling influences.

RURAL BY-LAWS.

THE grand jury at the Cambridge Assizes on Saturday made a presentment to Mr. Justice Grantham. The Foreman said he had been requested by his fellow-jurymen to state that they desired to express their thanks to his Lordship for the determination with which he had brought before the country the wanton and great obstacles thrown in the way of cottage building in country districts by impracticable and unnecessary by-laws, and by the arbitrary way in which they were sometimes administered by those in authority. They trusted that the President of the Local Government Board would at an early date take such steps as might be necessary to remove these obstacles. They sympathised with his Lordship in the personal inconvenience to which he had been exposed, and were glad to see that his health was sufficiently restored to enable him to come among them again as the judge of assize.

His Lordship said he was extremely obliged to the jury for the kind expression of approval of his recent struggle against unnecessary restriction, and he trusted the struggle would bring forth good fruit. He had never opposed proper by-laws, but what he had done had been to oppose the local authorities when trying to enforce non-existing by-laws, or trying to give illegal interpretations to those by-laws which they had to administer. That he did not quite succeed in his efforts, he thought they would say was more his misfortune than his fault. Surely it never entered into the mind of a man who placed himself in the hands of the public authority who prepared the by-laws that any rural council would have told him that his plans were unintelligible, much less that when the rural council had agreed to be bound by the arbitration or even the opinion of the President of the Local Government Board, and that when his award had been made against them they should at once ignore such award and prosecute the unfortunate builder for only preparing plans which the Local Government Board said were technically sufficient. Who would have thought that anyone sitting in the seat of justice could be found to hesitate after the proof of such facts as to whether he ought to dismiss such a criminal prosecution? He thought the jury would admit that his experience had been unique in this country. Perhaps he might be allowed as a judge, who was familiar with the question of the interests of magistrates, to say that when *ex-officio* magistrates, who were sitting on the bench only through their position as representatives of local authorities, adjudicated upon questions between similar local authorities and an individual as to the constitution of the by-laws, they must not be surprised if the public thought the Court might not be quite so impartial as a court of justice ought to be. He felt deeply grateful to the grand jury for their sympathy. He could not help feeling acutely the proceedings which had taken place.

On Monday two papers were read at the Surveyors' Institution on building by-laws.

Mr. A. R. Stenning said the time had come for a general remodelling of the by-laws and for their compulsory application to all districts. The by-laws founded on the Act of 1875 were intended to give urban authorities power to deal with new streets and new buildings in towns, and it was never intended to apply them to rural districts. Mr. Long had framed for rural districts a new set of by-laws in May, 1903. These, if reasonably and intelligently applied, would have the much-desired effect of considerably reducing the cost of building in rural districts. They dealt generally with sanitation, but one by-law, prescribing the deposit of plans, had led to the proceedings between the Chailey District Council and Sir W. Grantham. He had seen Sir William's cottages to which his addition was proposed. They contained two rooms on the ground floor, two on the first floor and two on the upper floor, and there was a good-sized outbuilding. He let these cottages at 3s. 6d. a week, so this was not a case of expecting a handsome return for money. He stopped building on receiving notice to produce plans, and deposited plans which he (Mr. Stenning) at any rate considered did comply with the by-laws. They declined to tell him what they required. What could he do but defend himself when summoned? There should be no discretion to any local authority to determine whether to adopt urban or rural by-laws. General by-laws should be made which would apply to the whole country and meet the requirements of rural districts by means of such exemptions as were contained in section 201 of the London Building Act, 1894. Builders should be disqualified from sitting on the rural district councils which administered the by-laws. There should be a tribunal of appeal. What constituted "a new building" should be clearly defined.

Mr. W. Menzies, in the second paper, said that rural authorities possessing by-laws framed on the 1887 model series, which were really an urban series, had no power to depart from them; on the other hand, no one could compel them to apply for revised by-laws. Modification, however, should not mean going from one extreme to the other. By the 1901 series of by-laws anything might be used for foundations, walls and roof. It was only reasonable that some powers should be exercised as regarded materials and construction.

Mr. Arthur Vernon insisted on the necessity of reducing the by-laws to some consistency. He said they all sympathised with Sir W. Grantham's bold and manly defence of his own position, without, however, saying that they would sympathise with plans that were hardly intelligible or descriptions that were not professional any more than Sir William would admire wills or depositions drawn by amateurs.

The papers are to be discussed at the next fortnightly meeting.

REMBRANDT.

A LECTURE was delivered before the Toynbee House Literary Society, Glasgow, by Mr. Thomas Rennie on "Rembrandt." In introducing his subject, Mr. Rennie said:—In the seventeenth century the art of Europe, hitherto dominated by Italy, received a new impulse and took a new direction. The religious and classical art of the Renaissance reached its highest development with the advent of the great Venetian painters of the sixteenth century, after which the art of Italy declined into conventionalism and triviality. All that was vital in German art passed away with Holbein. In Flanders the religious and classical traditions were continued by the giant Rubens, and in far-away Spain Velasquez was painting those portraits of Philip IV. and his courtiers which have made him one of the immortals. Rubens and Velasquez, however, moved in select circles, painted for select people, and their art, great as it was, was circumscribed. The new impulse came from Holland with the attainment of civil and religious freedom. Art in that country widened its range and continued no longer to be the handmaiden of the Church or the servitor of the palace. For the first time in its history it became at once national, civic and domestic, embracing a people and their whole environment. The greatest exponent of this new impulse was Rembrandt. The lecturer then proceeded to sketch briefly the life and work of the artist, dealing with the productions of his early youth, which although daring were naturally crude and experimental; then with those of his early manhood, when he adopted conventional methods; and, finally, with those of his

middle and old age, when his greatest works were produced. Rembrandt, he said, was sometimes over-fond of startling effects, and was frequently fantastic, but take him for all in all, he was the most many-sided and universal of artists, and in his paintings, etchings and numberless drawings he has left the greatest art heritage the world has ever received. The lecture was illustrated with a fine series of lantern slides.

ROYAL PILGRIMAGES IN SCOTLAND.

A PAPER was read on Saturday by Sir James Balfour Paul, Lyon King-of-Arms, to the members of the Edinburgh district of the Scottish Ecclesiological Society on "Royal Pilgrimages in Scotland." The paper dealt mainly with the pilgrimages of James IV., regarding which particulars were gleaned by the author from the Accounts of the Lord High Treasurer of Scotland, which are at present being published. The Scots, Sir James said, were great pilgrims, and probably performed these acts of devotion from the days of St. Columba. They were well-known figures on the Continent as they made their way to Rome or the Holy Land. But for every one who went to foreign parts, hundreds must have gone to holy places in the home land. It was not, however, till the fifteenth century that any detailed account was to be found. After the birth of James IV. his mother, and perhaps his father, set out with a large retinue on a pilgrimage to the shrine of St. Ninian at Whithorn, which already had a great reputation. Judging from the elaborate preparations which were made, it must have been looked on as a pleasant trip rather than as a penitential exercise. Of the visits which James IV. paid almost annually to Whithorn, the paper gave many interesting particulars, the extracts from the Accounts casting a vivid and sometimes amusing light on the modes of life and travel in those days. Only second in fame to the shrine of St. Ninian was that of St. Duthac at Tain, which was the refuge of the wife and daughter of Robert the Bruce when they were compelled to flee from Kildrummy. Of the journeys thither many details could be gathered from the Accounts—the routes taken, the time the journey took, and so on. The pilgrimage of 1507 was rather remarkable. It was probably the one alluded to by Lesley, who stated that His Majesty rode 130 miles in one day. The Accounts, without actually confirming that statement, proved the great rapidity of the journey. On August 31 the king was at Perth on the way north, where his horse required shoeing, and on September 14 a man was sent to Aberdeen "to speir of the king's incoming," which seemed to show that his attendants were not sure of his movements. The incident was a curious illustration of the impetuosity of the young king and of his personal activity. It was nonsense to call James IV. a debauchee, as had sometimes been done. The roads must have been wonderfully good to allow a man to ride 130 miles in one day, as he seemed to have done. There were other places scarcely less venerated, but as they were within easy reach of Edinburgh, there were fewer references to them in the Accounts. Whitekirk, in East Lothian, was at one time a place of much resort. In 1413 no fewer than 15,563 pilgrims visited the place, and the offerings were equal to 1,422 merks. In 1430 James I. had houses built for the reception of the pilgrims, and it was likely that his successors visited it from time to time. The Isle of May was another place of resort. But these did not nearly exhaust the list of places which James IV. visited; in fact, he never passed a holy place without remembering it. These pilgrimages were by no means on ascetic lines, and were really equivalent to our modern summer trips. Falcons, horses, dogs and weapons of the chase were invariably part of the Royal equipment, and the days were spent in hunting and hawking, as was shown by such entries in the Accounts as "2s. 8d. for pokes to put the laverocks in," while the amusements of the evening were supplied by the king's troop of Italian minstrels, or by local harpers, singers and story tellers, while the king himself would occasionally touch the lute. Cards and chess were also played to pass the time. Of the religious influence and significance of these pilgrimages it was impossible to judge in our day. Among the thousands of pilgrims many no doubt felt their spiritual life quickened and edified. As to King James IV. himself, though we could hardly call his life saintly, there was nothing necessarily insincere in these acts of devotion. The Mediæval mind was a curious mixture; pleasure and penance followed each other in quick succession.

NOTES AND COMMENTS.

At the present time, when the problem of the unemployed has become more difficult than ever, greater responsibility is cast upon public bodies and others in the acceptance of tenders. Local claims must necessarily receive attention. If a tender from a different town is a little lower in amount, public, or local opinion rather, expects that it will not be accepted. At the same time, there is a principle involved in the acceptance of the lowest tender which many will say should be respected. A case which shows the difficulty of giving a decision under present circumstances is now the subject of some controversy in Liverpool. It was decided to rebuild the Children's Infirmary in that city. Tenders were invited, with the usual stipulation that the committee did not bind themselves to accept the lowest or any tender. The result was that the contract was given to a firm who do not reside in Liverpool. In several instances all the workmen employed are not brought from a distance. But the Liverpool Trades and Labour Council were not hopeful, and they communicated with those who were supposed to control the arrangements for the new infirmary. The infirmary committee merely sent an acknowledgment of the letter. The secretary of the Hospital Saturday Fund committee, however, wrote:—"My committee are in full sympathy with the desire to keep work in Liverpool if possible. At the same time, they are quite satisfied that the action of the Children's Infirmary in placing the contract elsewhere is quite justifiable, and if blame is to be attached to anyone it must be to the Liverpool builders, who failed to secure in an open competition this work." The statement of the committee, it appears, is incorrect, for in the tendering the lowest amount was that of a Liverpool firm. The amount, however, was higher than had been anticipated. The Liverpool firm, and another firm whose tender was next in amount, were asked to compete again on amended quantities, and for the second time the lowest amount was that of the former. The competence of the firm to carry out the work is undisputed. It is sometimes no doubt necessary to pass over a builder whose work would be the most economical, but apparently there was no manifest cause for adopting that course with the Children's Infirmary.

THE late floods must have convinced the most ardent admirer of the Old Bridge of Ayr that it could not long sustain the contest with time and water. It happens also that some years ago the late ROBERT TEMPLETON bequeathed 10,000*l.* to pay for rebuilding the bridge. The money was to become available after the death of his three sisters. The last died about a month ago. In addition to bonds there are some houses in High Street, Ayr, which are to be sold. It is expected that the legacy will then amount to about 13,000*l.* The Old Bridge committee asked Mr. JOHN YOUNG, the burgh surveyor, Mr. EAGLESHAM, an engineer, and Mr. JAMES A. MORRIS, architect, to prepare a report on the rebuilding. It is intended to seek tenders and to proceed with the work as soon as arrangements can be made. The Auld Brig's prophecy, as reported by ROBERT BURNS, "I'll be a Brig when ye're (the new bridge) a shapeless cairn," is therefore not likely to be fulfilled.

ALTHOUGH the name of ANDREAS SCHLÜTER is not much known outside Germany, he led an adventurous career. He was a native of Hamburg, born in 1664, and in course of time became a sculptor. The King of POLAND made him his official artist, but Prince FREDERICK of Prussia, who was afterwards elector and king, enticed him to Berlin. The big palace at Charlottenburg, which is an amazement to tourists, was his work, for he was accepted as no less competent in architecture. The statue in Berlin of the Great Elector FREDERICK WILLIAM occupied him for about seven years. He was also the architect for the royal palace, for the earlier work of the sixteenth century is not easily discovered. Since his time many

additions have been made to it. It has lately been ascertained that a building in the Dorotheenstrasse, which was erected in 1712 for one of the statesmen of the time, VON KAMECKE, was designed by SCHLÜTER. He was a friend of the sculptor-architect. Latterly the building was allowed to fall into a ruinous condition. But the Architects' Society of Berlin have obtained some rights over it and will provide for its conservation. It is adorned with sculpture. The house possessed an English bowling-green, and the garden was evidently laid out in the English manner. There are larger works to serve as memorials of SCHLÜTER in Berlin, but this house reveals him in a new character as architect for domestic buildings.

CATHEDRAL SERIES.—ST. ASAPH: THE WEST DOOR.

INDEMNITY HOUSE, NO. 1 OLD BROAD STREET, E.C.

A PORTICO IN BOLOGNA.

ACCORDING to Mr. HAIG, this is the so-called Portico di S. Giacomo Maggiore, being a colonnade which follows the whole northern side of the church of that name, continuing also by the side of the church of S. Cecilia. This, one of the most elegant of the numerous street colonnades in Bologna, dates from the year 1447, when it was erected instead of another portico which had been pulled down, and which probably dated from 1267 or thereabouts, when the church itself was erected. GIOVANNI BENTIVOGLIO employed for the execution of the work the monk GIOVANNI PACI, who also is the reputed architect of the excellent façade of the church of Madonna di Galliera. The blocked semi-circular door shown in the sketch probably is a remnant of the earlier structure, but the other door leads by a passage into the church of S. Cecilia, well known for its ten frescoes by FRANCESCO FRANCA and his pupils, representing incidents from the lives of S. CECILIA and S. VALERIAN. This church was built in 1481 by GASPARE NADI, also through the munificence of GIOVANNI BENTIVOGLIO. The accompanying sketch only slightly indicates the general character of a colonnade well worthy of more complete study. The great length is, however, apt to make the actual structure somewhat monotonous, especially as the details vary but slightly.

COURTYARD OF A PALACE IN BOLOGNA.

NEAR the cathedral, and opposite the church of the Madonna di Galliera, with its elegant but dilapidated Renaissance façade, are to be found the two Palazzi Fava. One of these is a corner building of red brick, probably dating from the earlier part of the fourteenth century, noteworthy architecturally for its good Gothic windows, and historically for having been at one time the residence of ANDREA MANFREDI, of Faenza, General of the Servites, the same who in 1392 caused to be constructed the interesting portico of the church of S. Maria di Servi. The adjoining palazzo of the same name dates from the year 1500, and is remarkable not only for the bold architecture of its courtyard, partly illustrated in the accompanying drawing, but also for a collection of frescoes by AGOSTINO, ANNIBALE and LODOVICO CARRACCI and their pupils, illustrating the stories of JASON and ÆNEAS. There are also frescoes by ALBANI and LUCIO MASSARI, in all some sixty or seventy subjects, generally admirably treated and showing the characteristics of the various masters in a marked degree. The courtyard in question is entered from the raised and arcaded sidewalk of the street, and the first impression on entering it is rather striking, the corbels supporting the balcony or gallery occupying one side of the court having a particularly bold effect. A similar treatment of corbels may be seen in two or three other instances in Bologna, a marked example being a corner house near the church of S. Domenico; but the corbels here illustrated are probably the best of their kind in the town.

GRAND MANSIONS HOTEL, FOLKESTONE.

BY SEINE, OISE AND MARNE.

By T. FRANCIS BUMPUS.

MEAUX.

THE cathedral of Meaux—perhaps not so widely known as it deserves to be—might take a place among the first in France had it a nave commensurate in dignity with the choir, a *chef d'œuvre* of the latter part of the thirteenth century, and which, in some respects, I am bold enough to prefer to its parent at Amiens.

The present building enshrines portions of a church of the twelfth century, and which was described in the chapter records of 1268 as a beautifully constructed one, grand and wonderful—

Quoniam tam decora, tam nobilis structura nostræ Meldensis ecclesiæ.

About the middle of the thirteenth century this church,

and before the fourteenth century had passed into its second half. But the remainder of the work, owing probably to the unsettled state of the country during the English wars, languished, the construction of the transepts with their portals, and the lower part of the western façade, being spread over the fourteenth and fifteenth centuries, while that of the nave and solitary north-western tower dragged on until 1530.

The shortness of its nave, one of the few in France planned with double aisles, is the great drawback to the cathedral at Meaux. It is only of five bays, and as the two westernmost are absorbed in the towers it presents a somewhat truncated appearance externally. The piers, from which the arches separating the nave from its aisles spring, are formed of gigantic clusters of slender shafts, with capitals chiselled into wreaths of vine and holly—a naturalistic type of foliated ornament that betokens the gradually declining Gothic of France. Several of the

MEAUX CATHEDRAL—SOUTH TRANSEPT AND PORTION OF CHOIR.

of which remains are still visible in the lower tier of arcades on either side of the choir, and in the nave adjacent to the transepts, threatened ruin, whereupon the Bishop, Jean de Poincy, determined to rebuild it on a scale of increased magnificence. Accordingly, at a meeting of the Chapter held in 1268, it was resolved that, besides the offerings of the faithful, one year's income of all the benefices in the diocese that became vacant within ten years should be applied to the fund. This gigantic undertaking, entered upon with such enthusiasm, made but slow progress. Fortunately the choir, with its beautiful corona of chapels, was completed while the French style was at its height

pillars separating the double aisles, whose effect, owing to the extreme shortness of the nave is but imperfectly realised, are tall cylinders with carved capitals, and recall those in the same position in the Minster at Ulm. At the time of my visit extensive works of reparation and renovation were in progress; the whole of the south side had been mercilessly flayed, and the debased Gothic tracery in the windows of the nave chapels was being transmuted into Geometrical Decorated. Unfortunately the French have been taught to look to the Government as the owner and restorer of all religious buildings, and they do not concern themselves about either the security of their fabrics

MEAUX CATHEDRAL—VIEW ACROSS TRANSEPT LOOKING SOUTH.

or, except in a few instances, the character of their fittings and decorations.

Thankful should we be that the State is not so careful for us as it is in France, for then we should see here, just as we do there, a people careless of the noble buildings which surround them, in place of—as we do here—a people whose love for these old monuments is enhanced by the fact that they are themselves constantly invited to aid in their restoration and repair.

The two westernmost bays of the nave forming the bases of the towers are very narrow, and the arches extremely acute, but the spaces enclosed by them are nobly vaulted. Part of the triforium in the nave is Middle Pointed, of good character, and two clerestory windows on the north side are unquestionably First Pointed. In the transepts the workmanship, as may be gathered from the accompanying illustration, is uncommonly grand. The shallow arcading on either side the entrance is of rare excellence, and the windows, to which additional beauty is imparted by an inner plane of tracery, are set off by modern stained glass representing small figures of saints, wherein the positive tinctures are used so sparingly that they seem to flash forth like jewels from the sea of grisaille in which they are set.

But if the richness of the transepts at Meaux calls forth our admiration, we stand spellbound before the apse, which, with its colossal round columns, each strengthened by a slender shaft which shoots up from the floor of the sanctuary to the spring of the vaulting ribs, *d'un seul jet*, is invested with a combined boldness and lightness only equalled by its great prototype at Amiens, stained glass in the two-light windows of the clerestory being alone required to perfect the *ensemble*. To a severe criticism the clerestory windows in the apse at Meaux may seem hardly lofty enough, a defect which the piercing of the triforium, as at Nevers, Tours, Troyes and elsewhere, would remedy to some extent. In the three-bayed choir proper the two tiers of arches is a remarkable feature. The lower one, a remnant of the twelfth-century church, has short compound piers, and, there can be little doubt, supported one of those grandly developed tribunes to which I have frequently alluded as constituting so marked a feature of Early North-Eastern French Gothic. The easternmost respond of one of these arcades is still discernible in the nave, against the last pier on the north side, from which one would conclude that these vaulted galleries extended throughout the church, which in its twelfth-century state must have resembled Laon, Noyon and Senlis.

When, at Meaux, the reconstruction of the choir was resolved upon after the middle of the following century, the use of the "tribune" had gone out of fashion and been replaced by the lofty unbroken arcade. However, the architect retained the arches which opened into the much lower aisles of the old building. Rearing upon them an arcade so as to be commensurate in height with those in the apse, which he rebuilt *de novo*, he subdivided each of these upper arches, for purposes of stability, into two trefoil-headed compartments, and surmounting them by a large sexfoiled circle, thus produced a piece of work as useful as it was graceful and novel. In this part of the church the arches of the triforium are slightly triangular, and the clerestory windows are each of four lights with trefoils in the subarcuations and a sexfoiled circle in the head. Noble piers, composed of a cylinder around which four slender ones cluster, separate the two aisles that run round the choir. Here is a series of most graceful chapels with elongated windows of two lights each, in some of which a commencement of very creditable painted glass has been made, though one feels inclined to demur at the manner in which the subjects filling those in the lady chapel are allowed to spread themselves through both lights, instead of being confined to each one in the Mediaeval manner prevalent at the epoch which witnessed the erection of this part of the church.

(To be continued.)

USHER HALL, EDINBURGH.

A MEETING of the Usher Hall committee of the Edinburgh Town Council was held on Friday, the Lord Provost presiding, to take up the remit made to them at last meeting of the Council under the amendment of Councillor Cameron. The amendment, it may be recalled, was in these terms:—"The Magistrates and Council having now received and considered the estimates for the new City Hall, before accepting same, resolve to instruct the committee to forthwith submit a further report, showing in accordance with schedules of quantities, (1) the cost of the dome, the square tower, and their relative bearing walls; (2) stating whether the plans can be amended so that the large hall shall receive sufficient daylight, so as not to necessitate the use of electric light during morning or afternoon concerts; (3) stating whether the gallery accommodation can be substantially increased, and saying if the upper gallery can be lowered or otherwise improved; and (4) giving information on the acoustic properties of the proposed new large hall, with power, if necessary, to take high qualified expert opinion on this subject." This amendment, it is understood, says the *Scotsman*, was taken up in detail, and a remit was made to the surveyor to ascertain the respective costs of the dome, the tower and relative walls. As to the lighting, the architects were instructed, after discussion, to report at next meeting on the method of lighting the Music Hall, the M'Ewan Hall, and the Synod Hall, and whether in all the circumstances they considered their present lighting arrangements for the proposed new hall satisfactory. The question of the acoustics of the new hall was next considered, and it was proposed that a remit should be made to Mr. Matcham, the well-known London architect, and to Dr. F. H. Cowen, the musician, to report on this important subject. But subsequently it was agreed to delay giving final instructions on this subject until the next meeting. The most important discussion, it seems, took place on the seating arrangements and the spacing of the seats in the proposed new hall. Plans were shown with arrangements for rows of seats varying in measurement from 2 feet 1 inch to 2 feet 6 inches from back to back, and with space for each seat of 18 inches per sitter and 20 inches. The numbers in these cases varied from 3,599, the total sitting accommodation of the hall, to 3,157, but it was explained that these figures are inclusive of an allocation of 600 seats in the orchestral gallery. It was pointed out that 18 inches per seat was too little for a choir, and it afterwards transpired that no allowance had been made in the orchestral gallery for the space that would be taken up by the organ. This, it was estimated, would cut off about 200 seats in the orchestra. The plan whereby in the seating of the hall 20 inches per sitter would be given was, it is understood, most favoured by the committee, so that taking the total seats at 3,157, and deducting 600 for the orchestra, a hall would be left with 2,557 seats. The meeting was adjourned to give the officials time to get the additional information required by the committee.

REGISTRATION AND PARLIAMENT.

AT the dinner of the members of the Leeds and Yorkshire Architectural Society Mr. Butler Wilson proposed "The Houses of Parliament."

Mr. R. H. Barran, M.P., responded. Referring to the question of a Bill for the registration of architects, he said if the Institute was unanimous in its support there was every reason why the measure should go through, and every prospect that it would. If they were to have greater beauty and equality in the architecture of their towns and cities, it must be by putting greater power into the hands of the architects who were allied with the great societies. The public would probably be more ready to look at the utilitarian rather than the æsthetic side of architecture. There were many defects in bad building which recoiled upon them in their cities, and became a great expense in the clearing of certain areas, which under other circumstances might never have been necessary. They wanted to feel that the initiative must come from those who had the actual work to do. Would it not be a great advantage, from the public standpoint, if when gentlemen were appointed to have the supervision of architects' plans under local government, they could ask them if they had qualified themselves under examination? Speaking of the value of compulsory examination as an educational force, Mr. Barran instanced the case of Germany, where, to avoid having to join the ranks of the army, the young men strove to pass stiff exami-

nations to enable them to take a higher rank when they had to join the colours. This had its bearing on the intellectual development of the nation. All these men had had mental training of a wide area, and whatever sphere of life they filled afterwards, they did not lose the advantages of the work they had done for the examinations. They had not the same case in England, but he hoped they would not let the people lose the advantage of that asset. In the municipalities they sometimes saw architects' work given to qualified engineers. As cities they ought to take a wider view of the matter, and whether they were undertaking a large or a small building, to have it distinctly understood that it should be the work not of a waterworks engineer or any other engineer, but of a man who had had the training and had shown the capacity to justify him in undertaking the work. He thought the public would support the principle of the Registration Bill, and he would have pleasure to see his name on the back of the measure when it was introduced to the House of Commons.

The Lord Mayor proposed "The Leeds and Yorkshire Architectural Society," and referred to the architectural transformation of Leeds in recent years, saying he was sure the Leeds architects had done their work to the satisfaction of the citizens, and had embellished the city with some noble monuments of their art. His Lordship, after a passing reference to the disadvantageous atmosphere of great centres of population from the point of view of being able to see in full the architectural designs of the buildings, pleaded for a greater variety in coloured clays for decorative brickwork.

The president (Mr. Bulmer) replied to the toast, and gave a sketch of the history of the Society from its inception in 1876 down to the present time.

IMAGINATION AND THE IDEAL.

IN his second lecture at the Royal Academy Mr. George Clausen said imagination was the driving force of the artist, whether, like Velasquez, he painted outward things, or like Blake, fancies of the brain. Even to the portrait-painter imagination was essential to dictate the point of view and to control the artist's mind. The work of Blake was a proof that imagination, with only the poorest technical equipment, could make an artist though not a painter. Blake's simplicity was finer than his sublimity, which had always a slight touch of the theatrical. His art was founded on that of Michel Angelo, which he, in common with many others of his time, knew only from engravings, and he gained from them an impression of exaggerated muscular development. Blake himself was unconscious of his technical weaknesses, and thought himself to be a better painter than any of his contemporaries. Still, he could express his ideas, and his pictures touched the mind far more than those that were accomplished technically but were lacking in imagination. Mr. Clausen next considered the work of Metsu, De Hooghe and Jan Steen, comparing it collectively with that of another Dutchman, Mieris. In the work of the three first-named there was imagination, and though every object in their pictures was perfectly realised, the realisation was subordinate to the dramatic instinct. In Mieris imagination was wanting. His accuracy was remarkable, but he painted with the eye of a housewife looking for defects.

In Michel Angelo alone did we get the perfect union of imagination and skill of expression. Raphael was more in touch with the world, and had a wider observation and more power of assimilating the things around him. He saw things in groups—and in his power of grouping Raphael was unapproached—but when one thought of Michel Angelo one's mind generally recalled some single figure. Several of Michel Angelo's figures, among them the Delphic Sibyl, the Jeremiah and the Isaiah, were illustrated by Mr. Clausen on the lantern screen, as well as several frescoes of Raphael. In the frescoes the "Heliodorus" and the "Mass of Bolsena" the lecturer pointed out in each case the singular contrast of the groups of real figures (apparently portraits) on the one side of the picture, with the Raphaelesque abstractions on the other. Raphael was at his best in his painting of individuals. In his ideal figures it was possible to see the seeds of that insipidity that was developed later in the works of his followers. Raphael's work belonged to the eternal things of art. To us his opportunities were denied; our life was too complicated and all our conditions opposed to it. In Rembrandt we saw that, however unpromising a man's surroundings might be, his imagination, if he had it, would show itself in his work. Both he and Raphael could create

a Scriptural scene, the Italian with such apparent rightness that we felt that the things ought to have happened so even if they did not. Rembrandt's ordinary ugly people were at first less convincing, but when we looked more closely his imaginings gave us, as in the "Hundred Guilder" plate (the "Christ Healing the Sick"), a sense of reality that becomes typical.

Watts, too, was one of those rare spirits, a born painter with a natural gift of expression. Look at the portrait of himself at seventeen, now in the exhibition, or the portrait of his father, painted only a little later, and almost as fine as anything in the galleries. Or look at "The Wounded Heron," which recalled the skill and care of the great Dutchmen or of Velasquez. Mr. Clausen praised the construction and modelling of the painted heads by Watts. In them nothing was slurred, nothing sacrificed, and with the technical qualities was given something more than the mere expression of the moment. In each case, too, the impression of the sitter seemed to have suggested to the artist an appropriate handling. Watts had a fine feeling for beauty and quality of colour and a fine sense of gradation, and these were conspicuous in the portrait of Mr. Walter Crane, which was in some ways the best of his works. Three stages were to be seen in the painting of Watts. The first was portrait study—the search for accuracy. In the second he was seen striving for ideal beauty, and in the third expressing his imaginations, trying, to use his own words, "to suggest, in the language of art, modern thought in things ethical and spiritual." Probably the finest painting of the antiques was like Watts in the second period, and, to show the connection, Mr. Clausen exhibited on the screen photographs of some Pompeian pictures as the nearest existing approach to the antique. In his later period he was not content to embody old myths in new forms; he wanted to give fresh forms to modern ideas. Mr. Clausen admitted that for the sake of this he possibly sacrificed some of the finer qualities of his actual painting, but thought that this was a matter needless to discuss. Whatever we might have lost there was no question of the greatness of the aim of Watts, and some of his pictures, like great poems, had become a part of the time. Mr. Clausen touched on the sympathy between Watts and the Venetians and on his power in landscape, and in his final summing up of the great English painters' career said:—"Every development of his art seems to have come naturally; he kept aloof from all schools, and was throughout true to himself and to his own ideals."

In his address on Monday Mr. Clausen said Leonardo da Vinci urged those who wished to learn painting to keep a pocket-book always with them in which they could make sketches of figures and incidents when they had the opportunity, and thus store up knowledge for future use. This was sound common sense, for if a man set out to paint a picture he could not even begin unless he had some fund of acquired information to rely on. The early works and studies of great painters should also be examined, for it was useful to see that the pictures which seemed so perfect had been worked at over and over again. Where landscape or figure and landscape were concerned the invention of a picture was a simpler affair than the actual designing of a subject, because as a rule one had seen something in nature of the idea one wanted to express, and we selected rather than invented. It was well to study the drawings of Claude and Rembrandt. Light governed everything, and this must be studied out of doors. It could not be done properly in the studio. This was borne out by the fact that every great painter of figure had been a painter or student of landscape. But the necessary knowledge of effect of light could not be gained in landscape by the study of minute detail. We could not sit down to it. We must take a general view that covered the whole field and register the effect by a method that might be as summary as we pleased, so long as something was impressed on the mind, and thus help to build up a little reserve of knowledge. This, of course, was merely developing a faculty we already possessed, for everyone criticised a picture from his recollections of nature. Though it was easy to mention certain well-known rules in composition, it was impossible to lay down any laws for designing pictures. The plan must arise in the artist's mind and would depend on his mood and his temperament. Reynolds said that rules were made from pictures—not pictures from rules—and that we should not be subject to them but they to us. The old masters steadied our judgment and made us less apt to be led away by fads or by the cultivation of virtuosity—the making of painting the end and not the means. When Whistler

produced his nocturnes it was not merely for the sake of using blue paint. He painted them in the endeavour to try to render the beauty and the mystery of the night. Gérôme warned a young artist who had, perhaps, a tendency towards painting "slick," that to paint for painting's sake was no better than to talk for talking's sake. Too many students seemed to think—and we saw the results of it in the exhibitions—that mere imitation was the beginning and the end of the painter's art. But good modern work, such as that of Watts and of the best French painters of the middle of the nineteenth century, went naturally enough with the old. It was in sympathy with the spirit of the old work rather than with the letter, with the essentials rather than the details. As an example of imitative workmanship, Mr. Clausen selected the portrait of an old lady (Mrs. Lewis) by Frederick Sandys now in the exhibition at Burlington House. It was remarkable, but it was not brought into a harmonious whole. All the items were there, but not the picture. It was too intimate, and it gave almost a feeling of intrusion, as if we were looking closely at the old lady herself. It was a triumph of imitation, but how little in its way when compared with the fine Watts portraits. A general impression of truth in a picture was not gained by adding together all the little truths, but by seeing and rendering the thing as a whole.

THE NEW VICTORIA STATION FRONT.

THE Architectural Vigilance Society, in a letter to the editor of the *Times*, say they think that public attention should be drawn to the fact that the London, Brighton and South Coast Railway Company are about to build a new façade to Victoria Station without the employment of any artist to design it, the drawings being merely prepared in their engineer's office. The design will have the result of adding another huge mass of architectural commonplace to London, whereas such an erection might be made the opportunity for an important addition to the architectural embellishment of London.

A year ago they wrote to the board of directors pointing out the desirability of making the best of this architectural opportunity. Their secretary replied with every courtesy, but maintained the impossibility of making any alterations in view of the fact that one of the building contracts had been signed, and also stated that "the design had been prepared under the supervision of the engineer by a competent and trained architect."

That, it is presumed, means merely that the engineer has engaged an "architectural draughtsman." But draughtsmanship is not architecture; and the design which has been produced and is apparently to be carried out is, from an artistic point of view, without interest of any kind.

A few weeks ago the Society made a final effort to influence the company to reconsider the subject, in a letter from which the following paragraphs may usefully be quoted, as they serve to further explain the position:—

"It is not in any way a question of greater or less expenditure; it is a question of architectural character *versus* commonplace. The contrast is illustrated in the design which has been made for the wall, &c., along Buckingham Palace Road. This, though simple, is in good architectural taste, and no complaint can be made against it. If the same hand were allowed to recast the station front design, we might have something very much better at even less cost. It is not greater elaboration that is wanted, but a better style of architecture.

"We do not think the argument that the building contract has been entered into and cannot be altered has all the weight that you attach to it. It is always possible to revise a design and to modify a building contract accordingly; it is a thing frequently done. It is surely better to do this at the cost of some little trouble and delay than to erect permanently, as the frontispiece to your celebrated terminus, a building wholly deficient in architectural refinement and interest."

To this letter the board replied by repeating their former argument that the contract for the building as designed had been signed, and they did not see their way to make any alterations, though they would have been very glad to have pleased the Society better if they could.

Having met with this *non possumus* argument before in one or two other cases in which the Society has made protests of a similar nature, they have been told in the first instance that it was "impossible" to do anything; that it was "too late," and so on; but an appeal to public opinion

has, nevertheless, brought out practical proof that it was not too late. In the present instance no part of the actual façade has been commenced, and to put it into capable and artistic hands to remodel would only involve adjustment by "measure and value."

The Society submit that when a railway company are going to build anything so important as the façade of a large terminus they are under a moral obligation to the public to make the new building such as to be an addition to the architecture of London, instead of merely repeating the usual commonplaces (unhappily too familiar to us) of railway architecture. In Paris they would be compelled to do so; in London there is at present no power which can interfere.

SHEFFIELD ARCHITECTS AND SURVEYORS.

AT the last ordinary monthly meeting of the Sheffield Society of Architects and Surveyors, Mr. Horace Wilson, barrister, delivered a lecture on "The Law of Easements." The lecturer said an easement imposed on the owner of the land subject to it only a duty to suffer something, or refrain from doing something, for the benefit of his neighbour; for example, the grantor of a right of way was only bound to allow the use of the way, not to keep it in repair; and similarly in the case of ancient lights, he was only obliged to refrain from obstructing the light. No man could, as a general rule, excavate in his own land, or work minerals, in such a way as to cause his neighbour's land to fall in; but the obligation to support as against adjoining land bound only so much of it as was necessary to support the land in its natural state. Nor did the right to support from subjacent soil prevent the adjoining owner from draining his land as he pleased. With regard to the right to support of buildings, the main principle was that when anything had been done to increase the lateral pressure, as by erecting buildings, no man had a right to such increased support except for "ancient" buildings—i.e. buildings at least twenty years old, for which the support had not been acquired by fraud, stealth, or the mere revocable permission of the servient owner. A grant of land, however, for the express purpose of building upon it created a legal easement to such an extent as might be necessary for enabling the grantee to build the premises and enjoy them in safety when properly built, but the owner of the house was not entitled to do anything to increase the burden on the other owner, and must keep his house in repair. Again, the right to support of buildings by buildings might be acquired by prescription, provided that the adjoining owner must have been aware from the very nature of the building that support to it was necessary. The lecturer explained the system and procedure laid down by the Public Health Act in connection with the use of drains, and passed on to the easement of light, tracing the alteration of the law under the influence of modern town life, and pointing out the tendency of the courts to restrict the easement to such an amount of light as was actually necessary for the user of the particular premises, rather than to confer a right to the continued enjoyment of all the light that had formerly had access to the building.

On the motion of Mr. T. Winder, seconded by Mr. E. M. Gibbs, and supported by Messrs. E. Bramley, W. J. Hale, H. L. Paterson and W. C. Fenton, a vote of thanks was accorded to Mr. Wilson.

ELVASTON CHURCH.

THE old parish church at Elvaston, near Derby, was reopened on Sunday after extensive restoration, comprising repairs and improvements, the enlargement of the chancel and the building of new vestries. The fabric, portions of which date from about 1200, had fallen into a very poor state, serious cracks having become visible in the walls at the east end and in other parts. The interior of the church had deal seats, which were not only of poor character, but were inconvenient and ugly. The floor, which was partially of brick, was also unsatisfactory.

An ancient oak screen has been restored, the chancel has been lengthened by 11 feet, and a new sanctuary arch built where the former east end stood. The altar was blocked out by a monument which stood near to it. This displeasing effect has now disappeared, and an aspect of dignified space obtained, whilst the appearance of the tombs has been improved. The new sanctuary has no east window, but there is a reredos of carved white clunch filling the whole end. This is richly carved with subjects

and figures, and is effectively lighted by two new traceried windows of three lights each, in the north and south walls of the sanctuary respectively. In the reredos are sculptured figures of the central subject of the Christian faith and several of the saints. The glass, which was at the east end, and which was cracked and falling out, has been reproduced and placed in the new north window of the sanctuary. The pavements of the sanctuary and chancel are of black and white marble.

The floor of the nave under the seats is laid with wood blocks, and the passage with slate and white stone. In the nave the plaster has been removed from the walls, and stone ashlarwork found, which has been restored. The plaster has also been removed from the piers and arches, leaving the stone exposed, but the tomb and arch on the north side of the nave have not been altered. The windows have been reglazed, and their stonework made good where injured or decayed. The chancel is fitted with oak stalls and fronts, on what was the old arrangement, and the nave and aisle are furnished with open seats of oak, the ends of which are carved with a linen-fold pattern. A new cross has been placed on the screen, the Hon. Dudley Stanhope having assisted in the carving of the cross and in the restored portions of the screen. A carved oak pulpit has been placed in what was the original position. It is surmounted by a canopy and has a panelled back.

One chief feature of the work has been the decorative painting of the roofs and parts of the walls. The work is treated in a broad manner and with good effect. The sanctuary roof is enriched with gold and blue, with monograms of "B" for St. Bartholomew, to whom the church is dedicated. The chancel roof is coloured red, treated decoratively, and has gilding on the carved crests and bosses. The nave roof has been made uniform in tint and deficient parts made good. Latin inscriptions and texts have also been painted on the walls and roof of the chancel and sanctuary. The work has been carried out from the designs of Mr. G. F. Bodley, R.A., by Mr. Kett, of Cambridge. The decorative painting was done by Mr. Jackson, of Ealing.

LIVERPOOL'S ARCHITECTURAL BEAUTIES.

THE improvement of the streets, the demolition of insanitary dwellings and the substitution of air spaces are among the many schemes which the Corporation are now engaged upon in the interests of the health and beauty of the city. As distinct from these, however, it is interesting to note, says the *Liverpool Courier*, that there are in process of construction, as the outcome of more private enterprise, a number of buildings which, when completed, will be magnificent additions to the architectural beauties of Liverpool. The cathedral, of course, occurs first to the mind, although we cannot hope to see much of the proposed fabric for some years to come. Within another year or so, however, Renshaw Street will possess its Charles Garrett Memorial Hall. West Derby Road will have in the new Olympia a theatre upon which much thought has been exercised in determining its design, the Dock offices will stand imposingly at the pier head, and the Elder Dempster Company's extension will prove an acquisition to the Water Street architecture. Rapid progress is being made in the erection of all these buildings.

ARCHÆOLOGY IN ROME.

AN interesting archæological discovery has just been made in the crypt of Sta Maria in the Via Lata, which tradition has identified with the "hired house" in which St. Paul "dwelt two whole years." A priest, who is engaged in writing the history of this church, has found (writes the Rome correspondent of the *Morning Post*) there two pictures of the Roman martyrs John and Paul, who were beheaded by order of Julian the Apostate on the spot where the church of SS. Giovanni e Paolo now stands on the Cœlian, and a third picture representing two scenes from the martyrdom of St. Erasmus, bishop of Campania and protector of Gaeta, where the cathedral bears his name.

The Italian Press continues to manifest strong opposition to Professor Waldstein's scheme for the excavation of Herculaneum. The International Artistic Association has passed a resolution expressing the hope that the excavations will be undertaken "under the direction of Italian scholars aided by Italian funds," and that, "under no circumstances whatever, the Italian Government will relinquish its own

rights and duties by allowing private individuals or societies to interfere in the work." The *Giornale d'Italia* adds that Professor Waldstein, "who is so full of condescension and compassion for the Italian finances, and who is traversing the world in search of pecuniary assistance, may spare himself the trouble, for his alms have neither been asked nor will be accepted." It is sometimes forgotten abroad, and not only in the domain of archæology, that Italians dislike, above all else, to be patronised. They have a desire to be recognised as a great Power, which no longer needs assistance from its big neighbours. Hence even friendly advice and support from foreigners are at times resented.

STRAND IMPROVEMENT.

THE following memorial is to be presented to the London County Council:—

We, the undersigned, are anxious that the improvement of the Strand should be carried out in a manner worthy of so great an opportunity.

We desire to express our opinion that the frontage-line now proposed by the London County Council will have a bad perspective effect, and we trust it may not be too late for the Council to adopt some plan showing better consideration for the position of the churches of St. Mary-le-Strand and St. Clement Danes.

We also desire to protest against the height of the buildings already begun, and to express our hope that on the rest of the frontage the new buildings may not be so lofty as to overpower the two churches and Somerset House, which are and should remain the principal ornaments of the Strand.

NEW SCHOOLS IN CHESHIRE.

THE Cheshire education committee held a meeting at Crewe on Monday.

Dr. Hodgson reported the result of a conference held between the higher education committee and deputations from various places, with regard to the provision of secondary schools to meet requirements. The deputation from Crewe suggested that a new secondary day school should be built for 500 boys and girls on a site near the railway station, the present building being retained for evening technical classes and for certain day classes, but that the pupil teachers' centre should be held in connection with the new school. The deputation from Wallasey suggested that the County Council should take over the assets and liabilities of the present high school for girls. The cost of a new girls' school for 300 pupils is estimated at 12,000*l.* to 18,000*l.*, exclusive of site. Further accommodation for boys was required. The deputation agreed that a new school for 300 girls was needed. It was stated that there were 200 boys at the Grammar School, and that with the increase of the population of the district provision should be made for 300 or 350 in the near future, either by rebuilding the present school or by very extensive alterations to it. The Northwich deputation asked the views of the county committee on the building and maintaining of secondary schools in the town. It was reported that Sir John Brunner intended to build a new school, and a resolution was passed suggesting to Sir John that it is desirable that the proposed new school should provide accommodation for boys as well as girls, and that the administrative sub-committee should be asked for their opinion as to whether the school should be a mixed or a dual school, and also as to the number of boys and girls for whom provision should be made. A deputation from Nantwich and Audlem met the committee. It was agreed that there was a necessity for a new mixed secondary school for about 250 boys and girls, and the Governors of the Grammar School considered that the present site was suitable for the

new school, if adjoining property could be obtained. In this matter it was decided to reconsider the question after the receipt of a report from the Board of Education.

The report was adopted.

TESSERÆ.

Conventual Churches.

THE Benedictines usually erected a distinct parish church for the accommodation of their dependents and tenants (Westminster, Malmesbury, Gloucester, Peterborough), but sometimes made it an annexed building or an aisle (St. Alban's, Chester, Leominster, Sherborne). In other cases there was a division made between the monks and the parishioners, the townsfolk occupying the nave and the religious community retaining the eastern arm, which is the reason why at the Dissolution many choirs were destroyed and the nave spared. The Galilee porch, used as the last station in a procession, occurs at Ely and at (secular) Chichester at the west end; there is a small one annexed to the transept at (secular) Lincoln. They somewhat resemble the ante-church of a Cluniac church. The choir was arranged under the central tower or in the crossing, and when additional space was needed the stalls were then continued along one or more bays of the nave westward. The rood-loft was usually the choir screen, but at Durham it stood with its altar and reredos under the western arch of the tower, and the choir screen under the eastern arch of the tower. The transept had always apsidal chapels on its eastern side; these were afterwards often converted into aisles for altars, and on the south side elongated into a sacristy (Norwich). At Winchester there are cross aisles, with an upper stage for the exhibition of reliquaries (as at Caen, in St. Stephen's). The presbytery (*i.e.* before 1085) was often erected over a large subterranean church or under-croft, in imitation of the memorie of the ancient basilicas which contained numerous altars. Where there was a popular saint buried in the church his shrine took the place of the ancient high altar, and stood immediately east of the altar. At the back of it ran the processional path. Occasionally a range of chapels in a transverse aisle formed the extreme east end of the building, and again there was a choir transept, which gave the building the form of a patriarchal cross. The lady chapel after the thirteenth century was very often erected eastward of the main church, but it also held subordinate positions: detached on the north side of the choir; attached like a chapel south of the nave; opening out of the north wing of the transept, or at the west end of the nave. Sometimes it was a grand prolongation of the presbytery of equal height and dimensions.

Sixteenth-Century Gothic.

The last passage of the life of Gothic architecture is clearly not that of a poor imbecile thing dying of inanition; nor is it destitute of the elements of grandeur and pathos. Though old with the weight of years, it revives memories of a glorious past, and fights gallantly to the last for a place in English hearts. And gathering all its forces together, uniting skilled and elaborate architectural form to the splendid harmonies of colour and sculpture, it is only put to silence as the last ray of Mediævalism fades from English soil. And wherein did the distinctions lie between the dealings with nature of the early and late phases of Mediæval art? Mainly that the early schools came to nature timidly and with a childlike simplicity, while the later schools treated her with familiarity. And these diverse attitudes seem explainable by the light of the varying degrees of culture of the artists' times and the changed requirements of their art. The early sculptor learnt humble lessons of her because his limited perceptions kept him unconscious of the great extent of her capabilities for art purposes. On the other hand, the familiarity apparent in the late work speaks of a closer identification of man with nature. Hence the individualism of the workman and the naturalism of his art. The inauguration of an elaborate style, enriched by graphic and picturesque sculpture, was the result of a fastidious taste that called for the greatest excellence that could be had, and demanded a display of the studied effects of a conscious art. So this epoch may be regarded as a sort of middle stage between early art and the art of to-day, neither quite ancient nor quite modern, neither quite conventional nor ideal; and just because of its complex character, getting small favour from the style that immediately succeeded it, or from the romantic antique Gothic of to-day. It is of importance and interest to us, for

as the horizon is lifted we get a glimpse into the character of the art that is to succeed it. From that period to the present the ever-increasing identification of man with nature has been slowly but surely going on.

The Rood in English Churches.

The crucifix, as set up in our churches, has a special history of its own. Before the Reformation, the "rood" was ordinarily to be found in parish churches in this country. It presented the carved, sculptured, moulded or painted figure of Christ on the cross, and was, in fact, "a crucifix with images at the base." This figure was erected on a structure called the rood-loft, which appears to have traversed the church at the entrance to the chancel. There is in existence the most precise and unquestionable evidence on this matter. So universal does the existence of the rood in some form, either sculptured or painted, seem to have been, that in the returns of the churchwardens of 150 parishes in Lincolnshire, and dated 1565-6, there is mention of the rood as having been defaced or pulled down in at least 140. It will also be found that in Bonner's Articles, put forth during the reign of Queen Mary, in the year 1554 inquiry is made "whether there be a crucifix or rood-loft, as in times past has been accustomed, and if not, where the crucifix or rood-loft is begone, and by whose negligence the thing went." Again, in Cardinal Pole's Articles (1557) "whether they have a rood in their church of a decent stature with Mary and John." After this period, the historical evidence abounds that in the reign of Elizabeth these roods and rood-lofts were destroyed, far and wide, as monuments of idolatry and superstition. Not only so, but in the year 1560 a discussion appears to have arisen as to the propriety of setting the roods or crucifixes up again in parish churches. From all this it is plain that the crucifix formed an ordinary feature in the parish church before the Reformation; and it cannot be doubted that it did so, not as a mere architectural ornament, but as an object of reverence and "adoration."

Mediæval Churches of Holland.

The work of the Dutch architects of the Middle Ages is, comparatively speaking, a failure, their buildings are often monotonous and devoid of originality, their construction frequently faulty and their detail poor and uninteresting, at any rate to a great extent. Of course there are churches in Holland—such for instance as the cathedrals of Maestricht, Utrecht, Bois-le-Duc and Breda, and the minster church at Roermond—which avoid all these defects. But these defects are certainly the rule in Dutch churches, and the exceptions are few and rare. What led to these defects was the fact that instead of originating an architecture for themselves the Dutch Mediæval architects copied the plans of their churches bodily from the French; thus nearly all the churches of any size in Holland possess a chevet with radiating chapels, the naves generally have double aisles and chapels, and the smaller churches universally have one or more apses at the east end. The most usual departure which they made from the French plan was in exaggerating the length of the transepts and using one western tower instead of two. There are, however, exceptions to this rule, for the church at Arnhem, erected between 1328-1340, has two western towers. Curious examples of this exaggeration of the length of the transepts are to be seen in the great Protestant church at Bergen-op-Zoom, where each transept has six bays, while the nave has only four bays. Having copied the plan of his church from France the Dutchman borrows his detail ready-made from Germany. He never seems to have given sufficient consideration to the difficulties of site or material; thus, although except in a few instances driven to use brick, he adopts a plan almost peculiar to stone buildings and suggesting, if not absolutely requiring, vaulting to give a reason for its form and construction; and while driven by the insecure foundation to construct his roof of timber, this is generally made like a poor imitation of a stone roof.

The Plans of Mr. Paul Waterhouse for the new medical school and the plans of the five competitors in the limited competition for the new buildings of University College school at Hampstead will be on view in the council-room of the College, between the hours of eleven and four, until Tuesday, January 24 inclusive.

The Governors of the Manchester University have received 200*l.* from the local Society of Architects as a gift towards the endowment fund of the chair of architecture.

GENERAL.

A Committee of the Royal Institute of British Architects has been appointed, with Mr. Deputy Douglass Mathews as chairman, to consider the London Building Act Amendment Bill in detail.

A Design by Mr. Maidman, architect, Edinburgh, has been adopted for the new cottage hospital at Crieff. Fourteen designs were sent in.

The King of Italy has given 4,000*l.* towards the expenses of the exhibition to be held in Milan in 1906 in celebration of the opening of the Simplon Tunnel.

The Society of Antiquaries have elected as Fellows:—Ven. Archdeacon Barber, Mr. Robert Jones, M.D., Mr. J. C. Bridge, Mus.Doc., Mr. E. S. M. Perowne, Mr. C. R. Harries, Mr. W. F. Irvine, Mr. H. Sands, Mr. W. H. Brierley, Mr. H. Thackeray Turner, Mr. W. R. Lethaby, Mr. W. H. Wing, Mr. V. C. Crowther, Mr. Beynon, Mr. J. J. Foster and Mr. P. B. Ficklin.

Mr. G. A. T. Middleton delivered a lecture on Monday at the Camera Club on "Mediaeval Fortresses."

The Royal Commission on London Locomotion have instructed Mr. Fairman Ordish, F.S.A., the author of "Shakespeare's London" and other works relating to London history and topography, to write that part of their report dealing with the history of the growth of London traffic.

The Ludlow Town Council, as we announced last week, refused the offer of an equestrian statue by the sculptor, Captain Adrian Jones, on account of the fact that the expenses would amount to 100*l.* The Council have since received promises of help, and accordingly have requested Captain A. Jones not yet to destroy the statue.

Mr. J. Horsley Palmer, a Past Master of the Mercers' Company, has commissioned Mr. W. F. Yeames, R.A., to paint a fresco for the ambulatory of the Royal Exchange. The subject will be illustrative of the foundation of St. Paul's School by Dean Colet in the reign of Henry VIII.

Mr. Henry F. Kerr has delivered a lecture to the Scottish Industrial Art Association on "Some Notes on the Styles of Architecture." The lecture was illustrated by slides showing styles of architecture from Egyptian to modern times.

The Committee appointed to organise a permanent Old Manchester exhibition have issued a circular asking assistance either by the gift or loan of antiquities or by a money contribution to help in the initial expenses, and in the purchase of such objects and collections as may from time to time become available.

An Altar Screen, re-erected in Chichester Cathedral as a memorial of the late Francis John Mount, archdeacon of Chichester, has been unveiled. The memorial screen which has been restored in the cathedral is believed to have been erected by Bishop Sherburne in the sixteenth century. It was removed from its place in 1860.

Mr. Thomas Craigie Glover, of Mount Grange, Edinburgh, and of Earlsferry House, Elie, a partner in the firm of Messrs. S. & H. Morton & Co., engineers, of Leith, a director and one of the founders of the Bengal Iron and Steel Company, a civil engineer and contractor with a large Indian practice, and for many years settled in Bombay, who died on July 17 last at Edinburgh, aged sixty-seven years, left personal estate in the United Kingdom valued at 110,239*l.*

A Drawing in Water-Colours by Mr. T. M. Rooke, showing the front of Le Mans Cathedral, has been presented to the Birmingham Art Gallery by the Society for the Preservation of Records of Ancient Buildings.

Mr. G. H. Stanger, architect, of Wolverhampton, expired on Sunday last in his fifty-seventh year. He was a native of Nottingham, but practised in Wolverhampton for more than twenty years.

The Dutch Government have selected the military parade ground near the Bosch, at The Hague, as the site for Mr. Carnegie's Palace of Peace, subject to the approval of the States-General, with whom rests the final decision in the matter.

The Death of Mr. T. W. Shore, a well-known antiquarian, is announced. He was prominently identified with the Hampshire and Middlesex Field Clubs, and was a prolific writer and lecturer on antiquarian subjects.

Mr. T. Werner Laurie has in preparation for his cathedral series a volume on "The Cathedrals of England and Wales" by Mr. T. Francis Bumpus, whose books "Summer Holidays among the Glories of France" and "Holiday Rambles among the Cathedrals and Churches of North Germany" have afforded much gratification to students of ecclesiology.

The Dean of St. Paul's has received from a private donor a gift of 1,000*l.* towards the cost of the mosaic decoration of the choir aisles of the cathedral, which is now approaching completion.

Lord Strathcona was elected an honorary member of the Institution of Civil Engineers last week. It was announced that forty-nine associate members had been transferred to the class of members.

The French Ambassador on Friday last laid the foundation-stone of a new tower at the French convalescent home at Brighton, of which Messrs. Clayton & Black are the architects. The tower will be called the "Pavillon Paul Cambon." An illustration of the building appeared recently in *The Architect*.

The Priory Church of Holy Trinity, York, which is undergoing restoration at a cost of 5,360*l.*, has been reopened. It is stated to have been the first Christian church in York and the metropolitan church of the ancient see before the erection of the present minster outside the confines of the old Roman city. As far as possible the ancient stones have been replaced in the restoration by Mr. C. Hodgson Fowler, the architect.

Professor S. H. Capper is to deliver a course of six lectures in the schoolroom of the Presbyterian church, Victoria Road, Withington, on "English Gothic Architecture," on Tuesday evenings in the ensuing Lent term. The subjects will be "Norman Architecture in England," "The Change from Romanesque to Gothic," "English Gothic Vaulting," "Early Gothic Architecture," "Later Gothic Developments," and "Gothic Architecture in France and England." The course will begin on January 24.

Baron Alphonse de Rothschild has been presented with a bronze statuette, the work of MM. Victor Peter and Escoula, in recognition of his services to young artists by purchasing their works and presenting them to French provincial museums. The subject is "Goodness Protecting Art."

The President of the Board of Education has appointed Mr. R. B. Haldane, K.C., M.P., to be chairman of the departmental committee which is inquiring into the present and future working of the Royal College of Science and School of Mines, South Kensington, in place of Sir Francis Mowatt, G.C.B., late Secretary to the Treasury.

The Perth Town Council are to hold a competition for two alternative schemes in connection with the town hall. One calls for a new building to accommodate 3,000 people and to cost about 20,000*l.*, the other for additions to the present structure at an outlay of 6,000*l.*

The Council of London University finally approved on Tuesday of the plans by Mr. Paul Waterhouse for the new medical school and nurses' home.

An Exhibition of painted portraits, busts and models, by M. Emile Fuchs, is now open in Paris.

Mr. Arnold Mitchell has been successful in the limited competition for the new buildings of London University College school at Hampstead, and in which Sir Aston Webb, R.A., acted as assessor. Mr. Mitchell has been appointed architect.

Mr. W. Grant Stevenson, R.S.A., Edinburgh, has been asked by the Falkirk and District Soldiers' Memorial committee to carry out in bronze his model, after a design by Mr. John Campbell, which was awarded the first prize. The monument will take the form of a group of two members of the Argyll and Sutherland Highlanders, 7 feet 6 inches in height, one with fixed bayonet protecting a wounded companion.

M. Daumet has been elected president of the jury in the section of architecture for the Salon of this year.

The Remaining Works of the late Edwin Hayes, R.H.A., R.I., will be on sale on Saturday and Monday.

The Hammersmith Borough Council have invited the following architects to submit designs in competition for the erection of public baths and washhouses, viz. Mr. M. B. Adams, Mr. A. W. F. Cross, Mr. J. E. Franck, Mr. E. Harding Payne, Mr. J. M. Ross and Messrs. Spalding & Spalding.

Mr. James Weir, architect, of 17 Victoria Street, Westminster, S.W., has taken into partnership his manager, Mr. Fred Furrows, and his nephew, Mr. William May Weir. The business will be carried on under the style of Weir, Burrows & Weir.

Arrangements are in progress for an exhibition in Paris of works of the late Jules Dalou, the sculptor. All the models found in his studio will be included and can be purchased. The proceeds will be given to the Orphelinat des Arts, where the sculptor's daughter was received.

The Architect.

THE WEEK.

It was not necessary to refer to a catalogue when a painting by the late GEORGE HENRY BOUGHTON, R.A., appeared on the walls of an exhibition. His figures could be recognised at the first glance. It does not follow that his works were superior to those of other painters. Their distinctiveness was acquired by the loss of qualities which are of importance. In the first place, he confined himself mainly to subjects derived from early Puritan life in New England, or from the life of the humbler classes in certain parts of Holland. In both he restricted himself to the representation of a very few types of men and women. Once his limitations were accepted—and a similar allowance has to be made for other modern painters—there was no doubt about the skill displayed by Mr. BOUGHTON. Both in form and colour he proved himself to be a master, and his subjects were always interesting. No painter was better adapted to represent such scenes as WASHINGTON IRVING described in his "Knickerbocker's History of New York." He was no less competent to deal with scenes from the "Scarlet Letter" or "Evangeline." But however successful in North America or in Holland, it could hardly be said that English life came within his province. He was more happy with landscapes than with the inhabitants. By birth he was an Englishman, but he was taken to America at the age of three. He began painting at a very early age without a regular teacher, and was able to exhibit promising pictures in New York in 1857. Like most American painters he went to Paris in 1860, and remained there for two years. He thought of returning to the United States, but he found England preferable. Here he remained and attained success that was well deserved. He was elected an Associate of the Academy in 1879 and an Academician in 1896. The American people continued to take as much interest in him as if he were native born. His advice was often sought in the acquisition of pictures for public and private collections. Among artists and literary men in London he was prized, and his sudden death will be regretted by all who came in contact with him.

A FRENCH lady, Mdme. LHEUREUX, bequeathed to the city of Paris a few years ago a sum of money, under the condition that whenever the accumulated interest reached 120*l.* it was to be given alternately to an architect and a sculptor. The amount is not large, but it is a recognition of services, and that is sufficient for a Frenchman. This year the prize has fallen to M. ANTONIN MERCIÉ, whose *Gloria Victis* stands in one of the small squares of Paris, while his relief of the *Genius of Art* is appropriately placed over one of the gateways of the Louvre. Another sculptor who obtained the prize was JULES DALOU, who once taught in England, and whose influence is still abiding. A third is M. BARRIAS, the sculptor of the popular *Young Mozart* in the Luxembourg, and the *Bernard Palissy* in the enclosure of St. Germain-des-Prés. The favoured architects are M. GIRAUD, who gained reputation by his Petit Palais of the last international exhibition, and M. PASCAL, who designed many important edifices.

A REPORT has appeared from a committee of fire underwriters with respect to the Baltimore fire. In such a document the interest of insurance companies must of course be considered as paramount, and it is therefore possible there is some bias against builders in the conclusions. Particulars are given about twenty-three buildings, having a value of 6,546,040 dols. They were damaged to the extent of 3,684,062 dols. The insurance on them amounted to 3,606,622 dols. The sum paid by the insurance companies was 2,752,889 dols.

Baltimore was, if compared with other cities, supposed to be rather backward, for it could show no lofty buildings like those in New York or Chicago. But taking such examples as were attacked by the fire, the committee have come to the conclusion that they are not safer than ordinary buildings. They are unable to refer to any cases where the framing was distorted to an extraordinary extent. But from what they saw they conclude that collapses are not impossible. The materials employed were found in some cases to be unsatisfactory, and they consider that both the architects and the officers of the local insurance companies must have been careless in passing the buildings. A case is also pointed out of a bank in which ordinary wooden flooring and timber joists were employed, and yet it sustained only slight damage. One of the objects of the report may be to support insurance offices when they decline to make a large reduction in the case of insurance on account of improved construction. In any case the conclusions of the committee are remarkable, and are deserving of consideration in other places.

WE have received copies of correspondence between Mr. DOUGLAS ALLPORT, architect, and the Reigate Rural District Council. At Walton Heath, which is within the jurisdiction of the Council, a large club-house was erected for the golf club. One of Mr. ALLPORT's clients instructed him to design a bungalow on precisely similar lines. The plans were prepared and sent to the surveyor. But they were returned with the intimation that they did not conform to the by-laws and could not be submitted to the Council. The by-laws in use in Reigate do not allow of the erection of wood-framed buildings. But the club-house is of that type, and no attempt appears to have been made to prevent its erection. Mr. ALLPORT's letter to the chairman remained for nearly a fortnight unanswered. Then he was informed that "the Council cannot enter into any discussion with you respecting the alleged infringement of the by-laws by third parties, but if your client has any statement to place before the Council with a view to obtaining approval of his proposed building, and will submit the same, together with plans showing the details required by the by-laws, the matter shall receive attention, and he will be apprised in due course of their determination thereon." The only conclusion to be drawn is that in Reigate there is one kind of interpretation of by-laws for a golf club, while there is another for individuals. There should at least be consistency. In this case the client bought the land with the object of erecting a building to correspond with one which was approved by the District Council. There is no extra risk, for the bungalow would be far removed from any other building, and as it would have a picturesque appearance it could not be considered objectionable.

THE Berlin Academy of Art possesses some veterans among its members. ANDREAS ACHENBACH has been a member since 1849. He is one of the patriarchs of the Düsseldorf school. His landscapes are various; some connoisseurs give the preference to those from Sicily and various parts of Northern Europe, while others exalt his northern marine pieces. He has also painted scenes of *genre*. ADOLF VON MENZEL did not enter the Academy until 1853, but he is accepted as the most venerated of the members. That arises not only from his skill as a painter, but from his devotion to FREDERICK THE GREAT, for his pictures are interpreted as if they were efforts which prepared the Prussian mind for the struggle and triumph of 1870-1. The two painters are about the same age. An Academician who is three years older is RUDOLF VON ALT, who was born in 1812. He is an Austrian, and if water-colour art is admired by his countrymen it is owing to the success of his drawings of old buildings. EDUARD PAPE, another painter, is the youngest member of the group, for he is only eighty-eight.

THE FATE OF FRENCH CHURCHES.

IN September last we published an article on the fate of French churches, in which we endeavoured to explain the risks awaiting the glorious ecclesiastical architecture of France if the political projects connected with them were carried into execution. The article was suggested by one of M. MARCEL PROUST'S. A writer of a different class has now taken up this subject. The Count d'HAUSSONVILLE is a member of the French Academy, and is believed to possess the moderation which is considered characteristic of that illustrious body. His anticipations are, however, quite as gloomy as those by M. MARCEL PROUST.

It is true there has been a change of Ministers in France. But it remains doubtful whether the cathedrals and churches will be more safe under the new régime. M. BRIAND'S project still continues to be recognised as the most practical solution of the problem. Like the majority of French schemes, no matter what may be the subject, it is systematic, and on that account many of its imperfections may be overlooked. As we explained before, he proposes "that at the end of five years the churches of France can or shall be *désaffectées*, or, in other words, the buildings can be transformed into museums, conference halls or even casinos." The Count d'HAUSSONVILLE, no doubt through policy, does not deal with that possibility. He confines himself in his arguments to the supposition that it will not be necessary to secularise the buildings, for they may be continued to be utilised for ecclesiastical purposes. It is not, however, denied that the opposite course would be no less legal.

All the proposals turn upon the value to be attached to the Concordat which was entered into in 1801-2. By that agreement the cathedrals and churches were recognised as public buildings, and religious ceremonies were to be guarded by the authorities. In the course of the Revolution ecclesiastical buildings were destroyed or appropriated to secular purposes, and it was considered more prudent that the State should possess such rights as would prevent any efforts on the part of individuals to change their character. In practice no condition of the Concordat interferes with the use of the buildings by ecclesiastics as if they were proprietors.

All the buildings which existed at the beginning of the nineteenth century will continue to be public property. By M. BRIAND'S project the State can make new arrangements with those who wish to employ them for public worship. They will, however, be regarded as belonging to the departments or communes in which they are placed. In that way there is a possibility that local officials will exercise their little authority to an annoying extent. There is a second class of buildings, viz. those which have been erected since the signing of the Concordat. They will be treated like ordinary secular property. If it can be demonstrated that the State has not contributed any funds to their erection they will be allowed to be recognised as belonging to whatever body has most interest in them. Although buildings of this latter class comprise some admirable works of architecture, their fate does not excite many apprehensions. It is the ancient cathedrals and churches which arouse alarm among lovers of art and archaeology. The danger which awaits them is not confined to their being devoted to base uses.

It may be remembered that when arrangements were in progress for a display of Mediæval antiquities in connection with the last Paris International Exhibition the bishops demurred to lending objects from their treasuries. It was feared that if the objects in the precious metals, ivory, enamels, &c., found their way to an exhibition or a museum they were not likely to be restored. It would, perhaps, be too flagrant a breach of honesty if Church property were seized under such conditions. But M. BRIAND proposes that the whole of the objects are to become the property of the State as well as the buildings in which they were contained. It is not suggested to place them

forthwith in museums or to dispose of them to collectors. But they will be turned into sources of profit for the benefit of local establishments for the relief of the poor. France has no Poor Law, and the funds for the relief of people in distress are obtained by taxes on theatrical performances, exhibitions, entertainments, &c. Any congregation who may care to retain objects which belonged to their churches for generations will be able to do so on payment of a certain amount, which will be fixed by scale for every crucifix, chalice or whatever forms part of the movable property which will belong to the State. By coming under the hiring system, but without option of purchase, *instrumenta ecclesiastica* are likely to lose much of their old interest.

The old churches and cathedrals can be let for periods of ten years, but the leases will be repairing leases, for the buildings are expected to be left in the same condition as they were when lent. If when under the control of the Historic Monuments Commission and its staff of the ablest architects in France feats of restoration have been achieved which must make the judicious grieve, what is to be expected hereafter? The ostensible purpose of the State is simply to make money which can be applied to benevolent purposes, and it can hardly be hoped the authorities will be exacting in upholding the ancient character of a structure. The rent which will have to be paid will be calculated as amounting to one-tenth of the sums received in donations. But the whole of the income can if necessary be compulsorily applied to restorations. The relations between the worshippers in any building and the officials are not likely to become more friendly under the new condition of affairs, and there is a possibility that before long the people will look on old cathedrals and churches as white elephants which cost far more than they are worth.

There is another matter which also deserves attention. In letting churches the prefects are supposed to take the place of agents in respect of ordinary property in land or houses. An agent is expected to possess local knowledge, and he will avoid letting a house or a farm to tenants about whose means there is any doubt. The French prefect can hereafter also fix the number of churches it is desirable to have in any district. He may think that the expenses of conservation for two churches will be too heavy to be borne, and can tell the people they must be satisfied with one. But how the closed church is to be kept in a state of repair does not appear to be provided for. Old buildings do not suffer much from the wear and tear of congregations at services. There are other dangers which are more potent and which will be in operation no matter how careful a building may be locked.

We have no occasion to consider the inconvenience likely to arise from having the performance of religious ceremonies controlled by lay officials. From our point of view the most important consideration is the fate of the buildings. The modern governments of France consider cathedrals and churches as public dangers, and as such are not likely to feel much anxiety about their preservation. The majority of congregations have grown up with the belief that the cost of conserving their places of worship should not fall on them as individuals, and under new conditions they will not be more generous in paying money for such purposes, whatever may be the occasion. It is therefore to be doubted whether money will be always forthcoming to meet expenditure, and the inevitable consequence will be that many Mediæval buildings will perish or will be deprived of essential characteristics.

The French Minister of Public Instruction and of Fine Arts has conferred the Cross of the Legion of Honour on Signor Vincent Bonnani, the Italian sculptor residing in London. Among his works are busts of the Duke of Cambridge, the Speaker of the House of Commons, Lord Davey, Judge Bacon, Mr. Algernon Charles Swinburne and Signor Marconi.

ITALIAN GARDENS.*

ABOUT twenty years ago a foreign publisher brought out a costly work on gardening, for which he expected to find subscribers in most European countries, but especially in England. He had heard of the large expanses of land attached to English mansions, and he supposed English gentlemen would be grateful to have representations of many varieties of the artistic manner of cultivating them. His hopes were disappointed. With the exception of copies obtained for public libraries we believe not more than half a dozen were sold to English subscribers. If a similar book were brought out in our day it would receive more generous patronage. Whatever may be the shortcomings of the Queen Anne style of architecture, it has led men to think of the prim gardens of the seventeenth and eighteenth centuries in this country, and has made them realise they were little more than adaptations of the gardens of Italy.

The characteristics of the English and Italian styles could not be more succinctly described than in LANDOR's words:—"We Englishmen talk of planting a garden; the modern Italians and ancient Romans talk of building one. Ours, the most beautiful in the universe, are not exempt from absurdities; but in the shadiness of the English garden it is the love of retirement that triumphs over taste, and over a sense of the inconveniences." LANDOR created a beautiful garden near Florence which has been often described. But it was more of an English experiment than an Italian. In spite of his long residence in Italy he was a true JOHN BULL to the end of his life, and he could not reconcile himself to the suitability of many things he saw around him. Statues seemed to him unfitted for a garden. The early impressions made on his mind by English attempts to employ statuary were depressing, for of many great gardens it might be said—

There's statues gracing this noble place in,
All heathen gods and nymphs so fair;
Bold Neptune, Plutarch and Nicodemus,
All standing naked in the open air.

But the spectacle they presented on a winter's day must have disturbed so ardent a man as LANDOR. Accordingly he makes his favourite philosopher EPICURUS condemn sculpture in gardens. For, as he said, "sparrows wooing on the general's truncheon (unless he be such a general as one of ours in the last war), and snails besliming the emblems of the poet, do not remind us worthily of their characters."

Statues in Italian gardens, however, recall the palmy days of Rome, and are therefore worth preserving in Italy, although they might appear out of place in other lands. We have nothing to show that the private gardens of the Greeks were adorned by such works. They were, no doubt, introduced in groves and walks devoted to the enjoyment of the citizens. But the Roman warriors carried away an immense number of examples, many of which were used for the decoration of gardens of individuals. Indeed, in numerous Renaissance examples it would appear as if the possession of sculpture dictated the character of the garden rather than the gardens provided positions in which sculpture could be set up. The air of the country is less deteriorating than English air, and it took a long time, unless in marshy grounds, for a figure to present the woebegone appearance which we so often see in England.

The air had also another effect. There is some truth in the saying of CHARLES II. that a man could spend more hours out of doors in England than in any other part of Europe. But our weather is uncertain, and cannot be relied on for alfresco entertainments. In Italy it was and is still possible to fix days for such pleasure. The gardens were therefore laid out

with long walks with ascending and descending steps to platforms which seem to be mainly intended to display costumes. This characteristic appears to have struck Sir HENRY WOTTON more than any other peculiarity. And in fact the whole constructive part was meant to enhance spectacles. In pictures, novels and poems we have confirmatory evidence of the purposes for which the gardens served. In England it was believed what characterised the gardens could be readily transplanted, but attempts at imitation often ended in failures, and hence many people considered Italian gardens corresponded with the Gothic ruins which were at one time regarded as a necessary feature in demesnes.

The adaptation of Classic architecture to English needs has had, however, the effect of renewing the interest in the gardens. They are used as subjects for water-colour artists, and, indeed, occasionally there are exhibitions in which no other subject is admitted. Whether adapted for imitation or not, it is beyond doubt delightful pictures can be made out of those views. The general absence of flowers is to an English eye a drawback, and the shrubs are supposed to be of a less homely kind. But the combination of trees which seem in keeping with the architecture and the statuary, water in ponds and fountains, the glorious sky and the brilliant colours are among the most successful examples of co-operation between man and nature.

We are so accustomed of late years to look on Italy as a whole, and "an Italian garden" has become so familiar a phrase, there is a common belief that throughout the country more or less similarity is to be found in the arrangements. In the new book, "Italian Villas and their Gardens," the rational plan is adopted of treating the varieties according to their geographical position. It is therefore easy to discriminate between Florentine, Siennese, Roman, Genoese, Lombard gardens and those of Venetia. The illustrations are numerous. Some are in colour and are far more suggestive of Italy than those commonly given in books. The authoress has a genuine regard for architecture and sculpture, and her descriptions will afford pleasure to artists.

The relation between design and success is nowhere more marked than in Italy. It is pointed out:—"The inherent beauty of the garden lies in the grouping of its parts—in the converging lines of its long ilex walks, the alternation of sunny open spaces with cool woodland shade, the proportion between terrace and bowling-green, or between the height of a wall and the width of a path." It would therefore have been an advantage if plans were introduced in the pages. They might detract from the popular character of the book, but they would give a definiteness to the descriptions which a view or photograph from one spot cannot yield.

At one time the vicinity of Florence must have offered the spectacle of many beautiful gardens to a traveller. But foreign fashions have exercised their effect, and it is not the best part of Italy to see the glory of a Renaissance garden. The Boboli Gardens are the most important, and several plates are devoted to it. Among the Siennese villas is one which belonged to the DE' GORI. A small open-air theatre formed a part of it, and fortunately survives. It is thus described:—

Another antique alley of pleached ilexes, as densely shaded but not quite as long, runs from the end of a terrace to a small open-air theatre, which is the greatest curiosity of the Villa de' Gori. The pit of this theatre is a semicircular opening, bounded by a low wall or seat, which is backed by a high ilex hedge. The parterre is laid out in an elaborate broderie of turf and gravel, above which the stage is raised about 3 feet. The pit and the stage are enclosed in a double hedge of ilex, so that the actors may reach the wings without being seen by the audience; but the stage setting consists of rows of clipped cypresses, each advancing a few feet beyond the one before it, so that they form a perspective running up to the back of the stage, and terminated by the tall shaft of a single cypress, which towers high into the blue in the exact centre of the background. No mere description of its plan can convey the

* *Italian Villas and their Gardens.* By Edith Wharton. Illustrated by Maxfield Parrish. (2) *The Book of Topiary.* By Charles H. Curtis and W. Gibson. (London: John Lane.)

charm of this exquisite little theatre, approached through the mysterious dusk of the long pleached alley, and lying in sunshine and silence under its roof of blue sky, in its walls of unchanging verdure. Imagination must people the stage with the sylvan figures of the "Aminta" or the "Pastor Fido," and must place on the encircling seats a company of *nobil donne* in pearls and satin, with their cavaliers in the black Spanish habit and falling lace collar which Vandyke has immortalised in his Genoese portraits, and the remembrance of this leafy stage will lend new life to the reading of the Italian pastorals, and throw a brighter sunlight over the woodland comedies of Shakespeare.

It is a pity that some arrangement of the kind could not be adopted for the open-air performances of SHAKESPEARE'S plays, which, if weather permitted, would often be a success. There are so many scenes laid in Italian gardens, and there are so many words which suggest their beauty, it is only reasonable to suppose that the dramatist was often able to be a spectator of such entertainments as the Gori Theatre afforded.

The surviving villas in Rome and the surrounding country are numerous enough to fill a volume with descriptions. Several of the most prominent are described, including those of the Villa Borghese, which were modified in 1789 by JACOB MOOR, the English expert. His employment is a proof that the Italian nobles were not always satisfied with the arrangements adopted by their fathers, and were ready to prefer the system which prevailed at the time in this country. Caprarola, which is some distance from the city, is unlike any other villa in Italy. The garden, however, and especially the lower one, is a mere wreck; the plaster statues have all decayed, and it is now difficult to trace the plan. An Italian villa requires continual conservation, otherwise it falls into a state which is without the dignity of Gothic ruins. Another beautiful suburban villa is at Lante. At the Villa d'Este the gardens absorb interest rather than the building. The villas at Frascati have been the subject of admiration by Englishmen since EVELYN'S time.

Genoa is associated with buildings which do not seem to indicate fitness for either villas or pleasing gardens. The Genoese gardens, we are told, "are mere pockets of earth in coigns of masonry, where a few olives and bay trees fight the sun glare and sea wind of a harsh winter and a burning summer." There are, however, a few which are remarkable for the character of the architectural features. Among the Lombardy villas are those of the Isola Bella, which have fascinated generations of tourists. In Lombardy, however, foreign fashions were received with favour. But there France obtained the upper hand. We are told how—

In Lombardy the natural conditions were so similar that the French geometrical gardens did not seem out of place; yet even here a difference is felt both in the architecture and the gardens. Italy, in spite of Palladio and the Palladian tradition, never freed herself from the Baroque. Her artistic tendencies were all toward freedom, improvisation, individual expression; while France was fundamentally classical and instinctively temperate. Just as the French cabinet-makers and bronze-chisellers and modellers in stucco produced more delicate and finished, but less personal, work than the Italian craftsmen, so the French architects designed with greater precision and restraint and less play of personal invention. To establish a rough distinction, it might be said that French art has always been intellectual and Italian art emotional, and this distinction is felt even in the treatment of the pleasure-house and its garden. In Italy the architectural detail remained Baroque till the end of the eighteenth century, and the architect permitted himself far greater license in the choice of forms and the combination of materials. The old villas of the Milanese have a very strong individuality, and it is to be regretted that so few remain intact to show what a personal style they preserved even under the most obvious French influences.

Venetia does not at first suggest beautiful gardens. Of one at Val San Zibio it is said there are few in Italy comparable with it. Padua also has a fine

botanic garden, which some think is the oldest in Europe. The volume on Italian villas and their gardens will be found worth the study of those who have yet to visit them, or of tourists who have had the satisfaction of making their acquaintance. It recalls beautiful scenes, and is a tribute to the efforts of Americans to become independent of foreign books on all subjects relating to art.

The book on topiary by Mr. CHARLES H. CURTIS and Mr. W. GIBSON, which is also published by Mr. LANE, is one of a series of handbooks on practical gardening. The subject is allied to Italian work, for in both we see an effort to control nature. Dr. JOHNSON'S saying about one green field being like all other green fields expresses much else besides the partial views of a near-sighted old man who was most at home in Fleet Street. Nature if left to her own ways does not satisfy gardeners, and they are always desirous of imparting regularity to what is irregular. Where the Italian would use a stone or plaster figure, the topiarist would find substitutes in yew and box. There is no accounting for taste, and the formal garden of England will probably in the future display a more general use of topiary. There is a surprising amount of information in the volume by Messrs. CURTIS and GIBSON, which even opponents of the process will find to be interesting.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. T. E. Colcutt, vice-president, in the chair.

The Late Mr. T. Blashill.

MR. ALEXANDER GRAHAM, hon. secretary, announced the decease of Mr. Thomas Blashill, elected Associate in 1866 and Fellow in 1877. Mr. Blashill had for three years been an active member on the Council of the Institute, and there was no member, said the speaker, who had not a pleasant word to say of the deceased. During the many years Mr. Blashill had fulfilled the responsible position of superintending architect to the London County Council he had rendered much assistance to his brother architects, setting them right on many vexed points in the Building Act, and the profession would not forget those good services. But whether in Spring Gardens in his official capacity, or as a member of the Institute, Mr. Blashill had always brought with him an air of good-fellowship, which never left him. In their condolence with the relatives members wished to express their high esteem of the merits and works of their late colleague.

MR. W. WOODWARD said he well remembered spending a pleasant evening with the late Mr. Blashill, who surprised and delighted him with notes and sketches made on continental journeys. The speaker endorsed all that had been said about the assistance rendered to architects while Mr. Blashill was at Spring Gardens. Although the busiest of men, the deceased constantly attended the meetings of the Institute, and in the discussion which followed the papers gave members the benefit of his experience and knowledge.

MR. E. W. HUDSON alluded to the great assistance and interest taken by Mr. Blashill in the charities of the district of St. Pancras.

The Prizes and Studentships, 1905.

The Council's deed of award, made under seal pursuant to By-law 66, and read at the general meeting of January 23, states that the Council have examined the works submitted for the Institute silver medals, the Soane medallion, the Owen Jones and Pugin studentships, the Godwin bursary, the Tite prize, the Arthur Cates prize, and the Grissell gold medal, and gives particulars of the competitions and the results thereof as follows:—

THE ROYAL INSTITUTE SILVER MEDALS.

The Essay Medal and Twenty-five Guineas.

Fourteen essays on "The Development of Architectural Art from Structural Requirements and Nature of Materials" were received for the silver medal.

The Council have awarded the medal and twenty-five guineas to the author of the essay submitted under motto "Dil Aram" (Miss Ethel Charles, Cliff Cottage, Flushing, near Falmouth); a prize of ten guineas and a certificate of

hon. mention to the author of the essay bearing the motto "Beauty is Truth, Truth Beauty" (A. Romney Green, Foundry Meadow, Haslemere); and certificates of hon. mention to the authors of the essays submitted under the mottoes respectively of "Brunelleschi" (J. Jeffrey Waddell, Drumoyne, Uddington, N.B.); "Hawk" (J. Murray Kendall, 38 Canfield Gardens, St. Hampstead, N.W.); "I bide my time" (Leslie Patrick Abercrombie, 13 Victoria Terrace, Prince Alfred Road, Wavertree); "Nick *"Arrepos"* (Walter H. Godfrey, 8 Glebe Place, Chelsea, S.W.); "S. Edmund King and Martyr" (Cyril E. Power, Associate, 112 Kenilworth Court, Putney, S.W.); and "Ubique" (Hugh P. G. Maule, 16 Great Marlborough Street, W.).

The Measured Drawings Medal and 10l. 10s.

Seventeen sets of drawings went sent in of the various buildings indicated. The Council award the silver medal and ten guineas to the delineator of Haddon Hall, Derbyshire, submitted under the motto "Unicus" (Edward G. Wylie, 39 Airlie Gardens, Partick Hill, Glasgow), and certificates of hon. mention to the delineators of Somerset House, London, and the Pazzi Chapel, Santa Croce, Florence, submitted under the motto "Thames" (W. Harold Hillyer, Lyncroft, Shortlands, Kent), and the device of a Red Disk (Arthur R. H. Jackson, Royal College of Art, South Kensington, S.W.).

The Travelling Studentships.

The Soane Medallion and 100l.

Twelve designs for a royal palace were submitted. The Council have awarded the medallion and (subject to the specified conditions) the sum of 100l. to the author of the design bearing the motto "Crumpets" (S. Herbert Maw, Wentworth Villa, Wentworth Street, Bolton, Lancashire), and certificates of hon. mention to the authors of the designs bearing the motto of "Benedick" (Robert White Pickering, 25 Torrington Square, W.C.) and the device of a Lion rampant (W. S. A. Gordon, 20 Trafalgar Square, Chelsea).

The Owen Jones Studentship and 100l.

Three applications were received for the Owen Jones studentship from the following:—W. B. Brown, jun., six strainers; James McLachlan, six strainers; Harry Morley, six strainers. The Council awarded the certificate and (subject to the specified conditions) the sum of 100l. to Mr. H. Morley, 66 Sydney Street, South Kensington, S.W.

The Pugin Studentship and 40l.

Seven applications were received for the Pugin Studentship from the following:—A. R. Barker, six strainers; Norman Culley, five strainers; H. A. Dalrymple, six strainers; Frank Dyer, six strainers; E. Garratt, six strainers; W. H. Godfrey, six strainers; L. Wilkinson, six strainers. The Council have awarded the medal and (subject to the specified conditions) the sum of 40l. to Mr. Edward Garratt, 87 Penfold Street, Darlaston, near Birmingham, and a certificate of hon. mention and 10l. 10s. to Mr. Hugh A. Dalrymple, 45 Judd Street, Bloomsbury, W.C.

The Godwin Medal and 65l.

One application was received for the Godwin Bursary from Mr. F. R. Hiorns (Associate), of 71 Pepys Road, Wimbledon, S.W., and the Council have awarded to him the medal and (subject to the specified conditions) the sum of 65l.

The Tile Certificate and 30l.

Nineteen designs for an hotel lounge and staircase were submitted. The Council awarded the certificate and (subject to the specified conditions) a sum of 30l. to the author of the design bearing the motto "Palladio" (Robert Atkinson, 29 Sherwin Road, Lenton, Nottingham); a certificate of honourable mention and 5l. 5s. to the author of the design bearing the motto "E. Angle" (Alick G. Horsnell, South Primrose Hill, Chelmsford); and a certificate of honourable mention to the author of the design bearing the motto "Vista" (C. L. Wright, 66 Bolingbroke Road, West Kensington, W.).

THE ARTHUR CATES PRIZE, 40l.

Two applications for the Arthur Cates prize were received from the following gentlemen:—Vincent Hooper, 6 strainers. F. Winton Newman, 6 strainers. The Council have awarded the prize to Mr. F. Winton Newman (Associate), 31 Savenake Road, Hampstead, N.W., and a certificate of hon. mention to Mr. Vincent Hooper (Associate), 19 Elmes Road, Redhill, Surrey.

PRIZE FOR DESIGN AND CONSTRUCTION.

The Grissell Gold Medal and 10l. 10s.

Five designs for a winter garden in iron and glass were submitted. The Council have awarded the medal and 10 guineas to the author of the design bearing the motto "Onward" (James A. M. Hunter, Schoolhouse, Portlethen, by Aberdeen).

THE ASHPITEL PRIZE, 1904.

The Council have, on the recommendation of the Board of Examiners (Architecture), awarded the Ashpitel prize to Mr. Charles Lovett Gill, 17 Albert Street, Regent's Park, N.W. Mr. Gill was registered probationer in 1901, student in 1902 and passed the final examination in November 1904.

THE TRAVELLING STUDENTS' WORK.

Soane Medallist, 1903.—The Council have approved the drawings executed by Mr. Edwin F. Reynolds, who was awarded the medallion in 1903, and who studied in Egypt, Greece, Italy and Turkey.

Pugin Studentship, 1904.—The work of Mr. F. C. Mears, who was elected Pugin student for 1904, and who studied in Somersetshire, was also approved.

MR. JAMES RANSOME, consulting architect to the Government of India, read a paper entitled

European Architecture in India.

The tendency in recent years in India was, he said, to erect buildings in the styles and upon the lines of those found to be suitable in England, and he proposed to demonstrate the obstacles which opposed this practice, and to stimulate discussion upon the advisability of its continuance as a principle. For though the dearth of good European buildings in India was undoubtedly largely due to the lack of proper architectural training in their designers, it was at least open to debate whether this deficiency might not be, in an even greater measure, the result of an insistence upon European traditions in the face of climatic opposition. To enable those who had not visited India to form an opinion on the subject the author described such of the main conditions as must necessarily influence its architecture. In this connection he dealt with the cheap and abundant labour, the capacities of the native workman, the building materials and conditions influencing their use, climatic conditions, &c.

Except where earthquakes are of frequent occurrence, and in the case of buildings erected immediately after such disturbances, the possibility of their occurrence does not appear to have influenced the construction or designs of buildings; on the contrary, there seems to be a feeling that even the smaller buildings are incomplete without a tower, dome, minaret or turret. Cyclones affect construction rather than design, while dust-storms render it advisable that all apertures ordinarily left open may be closed on occasions. In many districts the prevalence of flies necessitates the addition of gauze shutters to every opening, which requires special treatment if it is to escape disfigurement.

A really water-tight roof is an unusual luxury in India, and as failure in this respect is attributed to the severity of the rains rather than the inefficiency of the roofs, but little effort has been made towards their improvement. Latterly pitched roofs have come increasingly into use, and though contrary to the traditions of the country, seem likely to survive the prejudices against them. It is something of a surprise to find that sheet-iron, either corrugated or plain, is largely used for roof-coverings in India, since it offers but little resistance to the outside temperature, is very noisy and rarely water-tight during the rains, requires constant attention, has no lasting properties, and is always unsightly.

In a country where buildings are rarely to be seen except beneath a brilliant and cloudless sky, the influence of cast shadows calls for greater consideration than in places blessed with less sunshine; hence much of the European work in India appears at its best only on the comparatively rare occasions when the sky is clouded. The native work is often richly inlaid with marbles, stones and tiles, and when carving is employed externally it is usually in low relief. For the most part Indian bricks are of excellent colour and quality, and susceptible of sufficiently fine treatment. The bricks are rubbed so that their joints are hardly perceptible, and the whole of the face is finely carved. Such work is abundant in many of the native cities, and is still being executed, but unless encouraged by Europeans, will shortly cease to be practised.

Dealing with the temperature of India so far as it affects building designs, the climate was classified under three head-

ings, viz., that of the Hills, that of the Plains, and that of the Coast, describing typical cases of each to convey an idea of the general conditions. The temperature of the hills tallies so nearly with what we are accustomed to in this country that, so far as heat and cold are concerned, there is no reason why buildings suited to an English climate should not serve their purpose equally well if transplanted to the hills of India. Unfortunately most of the buildings in the hills have been designed by those accustomed to deal with the buildings in the plains. Hence the type of building ordinarily found there, has rooms opening into verandahs which contain the staircases and offer the only means of access from one room to another. In private dwellings it is customary to glaze these verandahs on account of the cold, and this treatment has the effect of restricting the light and air admitted into the living-rooms. These, in consequence, fall into disuse during the day, and are deserted in favour of the glazed verandahs, which have ordinarily the temperature of a hot-house during the day and are often bitterly cold at night. This unhealthy arrangement is probably responsible for much of the illness to which residents in the hills are subject.

While the temperature of the coast may be considered as uniformly hot, that of the plains, though rising many degrees higher during the hottest days, falls considerably at night, and is some 30 degrees cooler in winter than in summer. Hence it is customary in the plains to close all apertures and exclude the outside air during the hot days, while around the coast windows and doors are thrown open all the year round, and the windows are frequently left unglazed. In the older buildings these opposite conditions produced a marked difference in the plans of buildings for the plains and those for the coast, for whereas the former were as a rule compact, with lofty rooms grouped around a large central apartment usually unlit by windows, the plans of buildings for the coast were extended and arranged so that the rooms had as many outside walls as possible. In the more modern buildings this difference is less marked, for on the one hand the introduction of cooling by evaporation has opened out the plans of buildings for the plains, while increased cost of building has curtailed the area of those for the coast. As a rule, however, the older arrangements were more satisfactory, and it is not desirable that the conditions which gave rise to them should be overlooked.

But whether on the coast or inland the comfort of buildings in the plains of India is chiefly dependent upon the extent to which their walls are protected from the rays of the sun. Many of the European buildings are now built without verandahs; but as their omission entails great discomfort, and ultimately results in the disfigurement of the building by various devices for protecting it from the sun, there can be no question as to the necessity for verandahs around the external walls of every habitable room except those facing north. It follows, therefore, that the appearance of an Indian building must necessarily be largely dependent upon the treatment given to its verandahs, and one of the chief difficulties in this connection is that of exposing a sufficient feeling of solidity in a building of which so large a proportion of its main walls must be concealed.

It would probably occur to most architects that these conditions should be favourable to the employment of Classic colonnades; and that this was the opinion of the designers of the early European buildings is demonstrated by the fact that nearly all of them were thus treated. The author went on to show, however, that the application of Classic architecture to Indian buildings was attended with difficulties, and that the achievement of a successful Gothic building under conditions which entailed the concealment of its windows was an even greater problem. In ecclesiastical buildings it has been the custom to indulge Gothic traditions at the expense of any considerations of climate. No advantage appears to have been taken of the natural adaptability of cloisters to serve the purpose of verandahs, which are usually omitted from designs for churches, and large, unprotected east-and-west windows are frequently introduced; hence Indian churches are for the most part unbearably hot, and frequently useless for purposes of worship during the hot weather. The author referred, however, to an effective arrangement in the cathedral at Allahabad (Sir William Emerson, architect), where the windows are in deep recesses and flanked by buttresses of considerable projection; this arrangement has the advantage of throwing the windows in shade during the greater part of the day.

In many of the modern designs for buildings attempts are made to follow the lines of native Indian architecture; as a rule, however, not with very satisfactory results, as they are based upon a too perfunctory study of native work. Considering it inevitable, and probably desirable, that European architecture in India should be influenced by the native styles of the country, the paper gave a rough outline of their chief characteristics and some illustration of the designs they have inspired.

For this purpose Indian architecture may be broadly classified under two heads, viz. Hindu and Saracenic. Instances of satisfactory structural forms are rarely to be met with in Hindu work, which seems never to have shaken itself free of the timber and rock-cut traditions upon which it was based. Yet much of this work is covered with beautiful detail and enriched with refined and graceful ornament.

It is strange that such a monument to the power of simplicity as the Taj Mahal should stand in a country so much in need of the lesson it should teach, and the fact that its influence upon the architecture of the country is imperceptible is perhaps even more surprising. Much of its effect is undoubtedly due to the increased play of light and shade, induced by its walls meeting at obtuse angles—a form of treatment which might be applied more generally to the walls of verandahs without detriment to their utility, and with some advantage to their appearance; for the excessive accentuation of right angles, produced by the brilliant sunlight of the plains, is not always beneficial to the appearance of a building. A dome is not ordinarily an economic form of roof, and it is not easy to find any useful employment for minarets and the little domed structures with which the roofs of Saracenic buildings are usually decorated, and which play so large a part in their composition. Nor is there much need in European buildings for the finely-pierced stone tracery which was extensively used in the windows and balconies of this style, or for those curious and typical features known as Jhomkes, examples of which are to be found on the gateway of the Taj. On the other hand, the Chujja, or wide projecting slab cornice, which is one of the most characteristic features of Saracenic work, is exactly what is required to shelter clerestory windows and exposed walls. The Kingras, or ornamented battlements, many of which are of very beautiful design, can be introduced effectively in place of the European parapet, while the great variety of form in the Saracenic arches affords sufficient scope for judicious selection. The style is also rich in oriels and balconies, designed in admirable taste and executed with considerable skill.

In conclusion, reference was made to a competition recently instituted, in which architects practising in England were invited to submit drawings illustrating their suggestions for the external treatment of a block of offices in India, of which a plan was supplied. Certain stipulations were made with a view to insuring that the designs should be suited to the climatic conditions of the plains of India. Although no stipulations were made as to the style of architecture which should be followed, in no instance was any attempt made to adhere to European traditions.

Mr. R. F. CHISHOLM, in proposing a vote of thanks to Mr. Ransome, said the paper was able and interesting for the reason that it went over a very large area in as few words as was possible, and represented with great fairness and impartiality the main features of an exceedingly difficult subject. The treatment of modern architecture in India, from an Anglo-Indian point of view, presented many difficulties, but the speaker in his practice of upwards of thirty-five years had never heard anybody treat those difficulties with so much ability as Mr. Ransome had done. He had grasped and placed before the meeting the one great problem in all Anglo-Indian architecture—i.e. the treatment of the external wall. To avoid, on the one hand, having the external wall so open that the building appeared to be a mere cage of architecture frequently only half concealing a more solid structure behind; on the other hand, to gain solidity by exposing a large surface of wall. This was the great problem in Indian architecture, and he did not think the solution had yet been solved. With regard to the division of the whole of India into two great classes, Hindu and Saracenic, the speaker thought the point was apt and true. India imbibed its arts, including architecture, from five different sources. First, there was the Chinese; and a second influence from the same source in the south-east of India; thirdly, there came a wave from Egypt and Arabia; fourthly, on the North-West frontier, through Europe and Persia; and lastly came that very strong Byzantine wave which

greatly modified all the native architecture of India. He endorsed Mr. Ransome's statement when he alluded to the Taj Mahal, and said that no photograph could do it justice or convey any idea of what the building was like. Words could not express the impression it made on the beholder, for its influence was really spiritual. All the styles which he had noted spread out like fans, and overlapped each other and modified each other, so it would be seen that although Hindu and Saracenic influences divided the architecture into two convenient classes, yet those influences went no further than the fusion of all European architecture into Gothic and Classic. With regard to the modern treatment of buildings, as to how far they should be native in character and how far they should be European, was a very difficult question to settle. He thought it best to make good use of local materials, employing the native craftsmen for the ornamentation, but remembering the amount of ornament should be in ratio to the value of the materials. He understood Mr. Ransome to say that the dome was not an economical form of construction. He believed the cost of a dome lay chiefly in the cost of the centring, but if the dome were made on true Hindu principles without centring, the cost of doming was only the cost of walling. The other points of the subject were so exhaustive that it was almost impossible to take them up. The paper was rather one for careful consideration, and it would need more than one evening or a week of evenings to decide any one of the many questions which had been put before them.

Mr. JOHN SLATER, who seconded the vote of thanks, said it must be a source of regret to all members that Sir William Emerson had been unable to attend the meeting. It was very interesting to notice Mr. Ransome's remarks about the natural building materials in India, because it could not have failed to strike those present that Sir William Emerson had gone to the expense of having marble from quarries in Greece, and such an introduction would be a magnificent addition to all the buildings in Calcutta. It might interest some members to know what so many had forgotten, that the great Gothic genius, William Burges, in 1866 or 1867 designed a building for Bombay which was to be a school of art, and it was remarkable how his genius adapted itself to the new conditions under which he had to work in designing a building for a very hot climate. In touching upon some practical points raised by the paper, the speaker did not know whether anyone had tried in India the use of slag wool for keeping out the heat. It seemed an extremely useful material for the country.

Mr. W. H. ATKIN BERRY said he could not help feeling that it was impossible to appreciate many of the points in the paper without some knowledge of the country. It was his good fortune to visit India some years ago, and travelling about the country he received some impressions, and one very strong one was that all attempts at European architecture were too truly European in character. It seemed to him then that it was fatal to transplant the traditional characteristics of our climate into a country that was so entirely different as that of India. He believed, to be successful in India, an architect must seriously study the traditional native style: it was no doubt difficult to grasp properly, but a mastery of it was the whole secret of success. He wished to say a word about corrugated iron roofs. It was wrong to paint the material red, to make it represent tiles; but he had noticed many pleasing examples in corrugated iron painted white. He was a little disappointed that the paper had not given more descriptions of the bungalows on the hill stations, because dwellings of that type afforded examples to architects of simple and picturesque buildings.

Mr. W. H. SETH-SMITH said he believed the purport of the paper was chiefly to illustrate civil architecture in India, and not the domestic. He questioned whether there was any great advantage in endeavouring to copy or develop the indigenous style in designing civil buildings, for such work had been carried out in wholly Classical styles. Nearly all Hindu architecture was to be found in temples, domes or palaces, and the palaces were very few in number. Therefore instead of trying to work on the traditional lines of Hindu architecture it might be better to treat such designs with a regard to local conditions, but also under modern scientific principles.

Mr. RANSOME briefly replied, and the meeting then terminated.

The designs and drawings submitted for the Institute prizes and studentships are now on exhibition in the gallery

of the Alpine Club (entrance in Mill Street, Conduit Street, W.). The exhibition is open every day from 10 A.M. till 8 P.M., until it closes on February 4. The presentation of prizes takes place on February 6.

LEONARDO DA VINCI.

A LECTURE was delivered by Dr. W. Wright, illustrated with lantern slides, on "Leonardo da Vinci," at the Birmingham and Midland Institute last week. Referring to Leonardo's early days, the lecturer said that his personality was even then singular and winning. A number of associations were attributed to him which were now more or less of a mythical character. Many tales were told of his precocious childhood which were scarcely believable. Leonardo da Vinci went to Florence, and at the age of seventeen he entered a workshop. There were many collectors of art in Florence at that time, to dine with some of whom provided a liberal education. The zeal for collecting and the interest in art was not confined to aristocrats, but was diffused throughout the whole population. It was as a painter that Leonardo was best known, and it was as a painter he (the lecturer) would first consider him. There were many crude paintings—in fact, almost all the paintings of Leonardo da Vinci were left unfinished. Among the pictures thrown on the screen was one of the famous "Last Supper." He was a painter who was always experimenting with methods of painting. He was very fond of grouping his figures mathematically in his pictures. He was fond of horses generally, and fond, too, of painting horses. The best-known painting of Leonardo, "Mona Lisa," was found in the Louvre. The picture had suffered a good deal from time. The enigmatical smile haunted the people of to-day as much as it did in the time of Leonardo. Perhaps the last of his paintings was "John the Baptist." There were many features in this which were the same as in "Mona Lisa." Subsequently the lecturer came to deal with Leonardo as a sculptor. None of his sculpture was at present to be seen in Italy. Although we had nothing to show of him as a sculptor, still one could form some idea from bronze, also partly from contemporary opinion, and also partly from the fact that he was a pupil of Verrocchio, who formed one of the greatest bronze equestrian pieces of statuary in the world—now in Venice. Speaking of Leonardo as an artist, Dr. Wright said there was evidence that Leonardo studied shells and spirals. The latter ran very much in his mind. He almost invariably wrote with his left hand, and wrote from right to left. Some of his signatures were written from left to right. He was ambidextrous. He drew with his left hand, although he painted with his right. When towards the end of his life he had a paralytic stroke his right hand was so affected that he was not able to paint, although he was able to draw. Leonardo was always studying nature in connection with his art. He was constantly trying to copy the methods of nature. In making an estimate of him as a painter one naturally compared him with Raphael and Michel Angelo. These two, however, followed him, and they were able to gain much from the study of Leonardo, just as he was only too ready to own that he had gained much from a previous artist, Masaccio. Dr. Wright also spoke of Leonardo as an engineer, and dealt with his interest in chemistry, zoology, music, anatomy, botany, geography, architecture, poetry and philosophy. He had an intense interest in everything. He did not seem to have been literary, and in fact discounted a good deal of the classics. He was particularly impressed with the order of the universe and the unity of the universe. He died in 1519 apparently from apoplexy, and his will was still extant. A large amount of antiquarian effort had been given to the explanation of an orthodox finish to a life which was marked by great heterodoxy as regards religious matters. His career, to Dr. Wright's mind, was inspiring as well as consoling.

A JOHANNESBURG SYNAGOGUE.

THE building committee of the Witwatersrand Old Hebrew Congregation invite architects to take part in a limited competition to be held for a proposed new synagogue for the congregation. It is to cost a sum not exceeding 25,000*l.*, and to be erected between End and Davies Streets, Old Doornfontein. Designs are to be sent in on or before March 15 to the President. Premiums of 200*l.*, 100*l.* and 50*l.* will be paid to the authors of the designs awarded respectively the first, second and third places. Mr. G. A. H. Dickson, president of the Transvaal Institute of Architects, has been appointed assessor.

NOTES AND COMMENTS.

THERE could be no better testimony to the honesty with which the late Mr. THOMAS BLASHILL carried out his duties as superintending architect to the London County Council than the respect with which he was treated after his resignation. He had been a city architect prior to his appointment, and it surprised some of his friends when it was found that he accepted an offer which was likely to put some restraint upon him. His experience would have enabled him to have served architecture as a referee and in other ways. But a short illness overcame a constitution that was once vigorous, and he died on Friday last in his seventy-fifth year. He always took his share in any movement which was thought to be for the benefit of architecture. He was one of the oldest members of the Architectural Association, having joined it in 1857, and he served as vice-president in 1861-2, and as president in the following year, when Mr. NORMAN SHAW held the position of vice-president. He joined the Institute as an Associate in 1866 and was elected a Fellow in 1877.

As about forty years have elapsed since Sir CASPAR PURDON CLARKE became connected with South Kensington, he is familiar with all the details of the system or systems connected with that institution. It can claim to have made him an architect, an expert and a director, and his example offered encouragement to other students. The Board of Education will, no doubt, regret the departure of an officer who in many respects represented the Government system. There is, however, cause for satisfaction in official circles. Few of the men who have occupied prominent positions at South Kensington have been able to convince the public of their merit. To appoint one as Director of the Metropolitan Museum of Fine Art in New York is therefore a victory for circumlocutionism, and almost the only one which can be recorded. In no museum is there a better opportunity presented for a director to display his courage. The collections have cost an immense sum of money. But some experts believe that a great many of the objects are not genuine. Sir PURDON CLARKE should be allowed to weed the collection of all doubtful "antiques," in spite of the admiration they receive from Americans. But to do so without the support of a courageous committee would be almost suicidal. Americans are very shrewd, and they imagine they cannot be deceived in examples of Mediæval and Renaissance art, but sooner or later they will have to submit to being disillusioned about their treasures in the New York Museum. In any case we hope Sir PURDON CLARKE will be enabled to render the services for which his ability and experience qualify him.

STUART MILL looked upon co-operation among the labouring classes as one of the ways to a change in society, in which the freedom and independence of individuals would be combined with the advantages of aggregate production, or, in other words, a realisation of the best aspirations of the democratic spirit. The history of those aspirations has, however, shown that the working-men shareholders have little consideration for the employes who do not hold shares. They look on themselves as the pioneers of a new system, but of one which retains many of the tyrannical ways of those which are ancient. Respect for what is established is not among the virtues of co-operation. Of this an instance relating to architecture has been lately afforded. The Royal Arsenal Co-operative Society of Woolwich possess an estate on which dwelling-houses are to be erected. For that purpose an architect and surveyor is desired who will also serve as manager of works, comprising a large carpenters' shop with wood-working machinery, an artificial stone workshop and a chalk mine. He is to be between twenty-five and forty-five

years of age, must work on five days from 9 A.M. to 5.30, and on Saturday till 1 P.M. He will also have to devote one evening in each week to attendance on the committee, as well as such other times as may be arranged. He is to give his whole time to the Society; he is to prepare designs, take levels, comply with the requirements of local authorities, give all notices, get out quantities, specifications, estimates, details. In conjunction with the general foreman he is to purchase all materials required, to reject and condemn materials which are unsuitable, to accept responsibility for the economy of the works department, to advise the committee in estate management, &c., and to act in all things under the superintendence, direction and control of the committee. The Society is to have absolute property in all his correspondence as well as all the plans and documents prepared for the Society. Each applicant is to state the inclusive salary with which he will be satisfied. If the conditions are in accordance with the aspirations of the democratic spirit, then for an architect, at least, it would be preferable to have the more ancient days which recognised that there existed a difference between his employment and that of an ordinary labourer. The Royal Arsenal labourers probably are dismissed at a moment's notice, while with the architect a month's notice on either side will be necessary. But can the committee expect that a man tied down with such conditions as are imposed will be respected by the foreman or workmen, or by those who will have to supply materials? A man who has all the qualifications demanded can find temporary employment in other ways, and will have the satisfaction of feeling that he can think of his occupation without a pang.

MISTAKES will arise in human organisations, and contractors who have to deal with a multiplicity of items cannot at all times guarantee their infallibility. When lapses occur, public bodies should remember their own perfectibility is not secure, and leniency becomes advisable. For instance, Messrs. HARSTON, the architects, reported to the Metropolitan Asylums Board that Messrs. LESLIE & Co., the contractors for the Joyce Green Hospital, informed them that by an erroneous interpretation of the specification they had executed works of the value of 770*l.* without any authority. In such a case the Board were not responsible, and might decide against payment. But the works committee having recommended that a sum of 600*l.* should be granted to the contractors, that arrangement was approved. It is not, however, to be supposed that such generous dealing is to be taken as a precedent for condoning carelessness in keeping contractors' accounts.

ON Wednesday Mr. C. J. HOLMES delivered his inaugural lecture as Slade Professor of Fine Art in the University of Oxford. He treated of "Practical Work as an Aid to the Study of the Fine Arts." He referred to the increase of knowledge in all departments of art during the last half century. The literature had also grown, and was now almost as complicated and bulky as the objects with which it dealt. The aims of the University in dealing with this vast and complicated mass of material might be summarised thus:—(1) To provide every student with a sound general knowledge of the theory of the principal branches of the arts. (2) To see that those who were studying special subjects, whether connected with the schools or not, should have every possible help in their work. (3) By means of the University collections to bring students into actual contact with works of art, so that their knowledge should not be mere text-book knowledge. Mr. HOLMES proposed to commence his lectures with an exposition of ancient sculpture, to be followed by descriptions of the work of some of the Renaissance and modern artists. In the summer term he will lecture on graphic design, and utilise the prints and drawings belonging to the University as illustrations.

ILLUSTRATIONS.

CLOISTERS AND CAMPANILE OF S. FRANCESCO, PISA.

THIS church stands near the town walls in a very quiet locality, and is, as regards the interior at least, in an almost ruinous condition. "I believe," says Mr. HAIG, "it is intended to be repaired, and is well worth it, as, besides being a church of good proportion, it contains on the soffits of the arches and on the ceiling of the chancel some very interesting frescoes by TADDEO GADDI, dating from 1342. The church is mainly of the thirteenth century, and of a generally plain exterior, the best part of which is the campanile shown in the sketch. It is built of red brick, and is characteristic of this part of Italy; the top is probably an afterthought. The cloisters, the largest in Pisa, are two centuries later than the church, of Early Renaissance architecture, and, with the exception of the capitals and the corbels, without ornamental features. The richly-decorated columns, mentioned in a well-known guide-book as existing in these cloisters, you will look for in vain, but the cool and pleasant arcade will be found a desirable retreat on a hot day. The place is nearly deserted; an aged priest may be seen now and then, but the once appropriate inmates, the monks, will be seldom seen here now. The enclosure is somewhat neglected, but two olive trees, fit accessories, adorn the place, and with their cool green foliage harmonise well with the rich colours of the surrounding buildings."

A DOORWAY IN GENOA.

IN the immediate vicinity of the small church of S. Matteo, in the old part of Genoa, will be found the doorway seen in the sketch we publish. There are in the neighbourhood three or four similar portals, this one being by no means the most elaborate, but chosen because it took the shortest time to sketch on an occasion when every minute was of importance. Like most of the best work in Genoa, these doorways are of marble, with which material the lower part of the palaces to which they belong is faced. The marble is either entirely of the light brown Genoese kind, or this alternated with broad bands of black marble, as in the palace facing S. Matteo in the small piazza. The portal to this palace is similar to the one sketched, but rather more elaborate as to the sculpture in the panel. The panel shown is much decayed and difficult to make out. The date is somewhat earlier than the better known palaces of Genoa, which are generally of the latter part of the sixteenth and the beginning of the seventeenth centuries, and the work, though smaller in scale and altogether less pretentious, is nevertheless in better taste than that we meet in the world-famed Palazzo Doria Tursi, for instance, or any other of the gigantic palaces of Genoa; but as these doorways are to be met only in the old, narrow and gloomy streets, they do not appear to receive the attention which they deserve. The column in the interior is of a type frequently to be seen in the courts and staircases of this part of the town, and, although scarcely "grammatical," is yet effective. The columns appear to be of a later date than the portals.

SAVOY HOTEL, STRAND, W.C.

THE OLD CHURCH HOUSE, LEWES.

LEWES was at one time noteworthy for its castles and churches. The Church House, now used as offices by Messrs. ERNEST RÜNTZ & FORD, is a relic of ecclesiastical property. In 1525, according to a record, it was the property of the parish of St. Andrew, but was subsequently united to St. Michael, to which it now belongs. The following entries appear in the churchwardens' book:—

1525 "M^d that John Kotmot and Richard frankwell hath reckned wth thomas awdley for the Church house the xxvith day of December the xviith yerre of the rayne of Kyng harre the viiith and the same day John, and Rycharde frankwell hath resefyd a yere rent of the howse, and at

owher Ladey day yn Lent next Komynt, the same thomas oweth a half yeerre rent."

1527 "M^d that L. Richard colpeper and John parker wardens of Sent Andrews have recevd of Thomas Audele for the Cherche howse xiiii s, iiii d. the xxth day jennuary."

In 1540 Thomas was sold up on distraint, and we get this inventory:—

"And the next folowyng goods are the emplements of the howse belonging as to the Cherche howse.

"Item in the hall a table with a payr of trestells.

"Item a round cowberd: item in the parlour a table with trestills and form belonging.

"Item a cuberd standing next the Strett by the dore.

"A bedstead in the same parlor: item a bedsted in the Chamber, with the sealing over. (The 'sealing' is the tester or top of the bedstead.)

"Item in the ye Chomney in ye Kydchin a barre of iron with ii potte hangyers."

Then it contained three rooms, a parlour or hall, a chamber overhead and a kitchen beyond. The same arrangement continued until reconstruction.

FALFOUR PLACE, W., FROM SOUTH-EAST.

NEW MAGISTRATES' OFFICES, BARGATE, SOUTHAMPTON.

THE HECTOR MACDONALD NATIONAL MEMORIAL, TO BE ERECTED ON THE GREEN HILL, DINGWALL, ROSE-SHIRE.

LIVERPOOL CATHEDRAL.

A MEETING of the Liverpool Cathedral committee was held on Monday at the Church House, Lord Street. Sir W. B. Forwood presided. The balance-sheet to be submitted at the annual meeting of subscribers on Monday next, at which Lord Derby will preside, was considered and approved. The architects reported very considerable progress with the evcavation for the foundations of the cathedral, the concreting having already been commenced. It was resolved to erect a shelter for the workmen where they could take their meals, and it would also be available for the holding of occasional services. The committee decided that the roof of the lady chapel be groined in stone. It was reported that the model of the cathedral was nearly completed, and it was decided to ask permission to place it when completed in the Walker Art Gallery for public exhibition.

HIGH SCHOOL, EDINBURGH.

A T a meeting of the Council of the Cockburn Association held recently the following report submitted by a sub-committee appointed to consider the proposal to convert the Royal High School, Edinburgh, into a National Gallery was unanimously adopted. A copy has been sent to the Secretary for Scotland:—"The committee beg to report that they have had before them the report to the members of the Royal High School Club prepared by Mr. Henry F. Kerr, architect, upon the question of the adoption of the Royal High School as a National Gallery. They feel that the Association is not called upon to enter into the question of the suitability or otherwise of the building or site for a picture gallery, but that it should confine itself strictly to the question of the effect that any alterations might have upon the external appearance of the building. It would seem from the requirements for lighting in a picture gallery that if the High School be acquired as a National Gallery alterations to obtain suitable lighting must at once be required, and that these alterations could not be made without affecting to some extent the exterior of the building. Looking also to the smallness of the superficial area of the High School, the committee feel that extension would be required, if not now, at least in the near future. The building as it stands is one of the finest in the city, and the committee recommend the Council that, unless a guarantee be given that alterations for lighting and possible extensions will be carried out so as in no way to affect the present lines of the building, the Council should express its strongest disapproval of the scheme. The committee further recommend the Council to state that in their opinion, if an art school or any other building is placed on the west playground of the school, it would, by interfering with the fine prospect of the buildings from the west, most injuriously affect their beauty. They would also deprecate the erection of any extensive new building in the immediate vicinity of the present structure, as they consider that its effect might be in this way endangered."

THE LATE ROBERT BROUGH, A.R.S.A.

THE collision on the Midland Railway at Cudworth was followed after two days of agony by the death on Saturday evening of one of the most promising of modern painters. The loss is not one to Scottish art alone, says the *Scotsman*, but to British art, for Mr. Brough, though only thirty-three years of age, had taken a position as a portrait-painter, both in London and in Scotland, to which very few at so early an age ever attain. To his exceptional painting power this was solely due, as the deceased artist had no adventitious aids in his youth, and had to rely solely on his own abilities, which were undoubtedly great, and on that industrious application of them without which even genius cannot go far in this world. He was probably the most brilliant student that has passed through the Royal Scottish Academy's schools in recent years; his success as a practising artist was rapid; and his friends, of whom this tall, handsome, young Scotsman from the north, with cosmopolitan instincts and charming manners, had many, were looking forward to his rising at no distant date to the very top of his profession. Their hopes have been rudely dissipated by this grievous calamity, and, though the works that he has left behind will entitle him to a niche in the gallery of fame, that thought will not assuage the grief that one so gifted should have by so cruel a fate been cut off when everything seemed to forecast so prosperous a career.

Born in Invergordon, Ross-shire, in 1872, Robert Brough was early brought to Aberdeen, where he attended school. Subsequently he served an apprenticeship with Mr. Andrew Gibb, lithographer and engraver, the successor of the firm of Keith & Gibb, where Sir George Reid, ex-president of the Royal Scottish Academy, worked when a young man at the same occupation. Mr. Brough studied art at the Aberdeen Art school, but his apprenticeship ended, he set out for Edinburgh, resolved to embrace art as a profession; and in 1891 he was admitted a student of the Royal Scottish Academy's life school, of which, as has been said, he was a distinguished student. In 1892 he gained there the Chalmers bursary and the MacLaine-Waters medal, and in the following year he won an extra prize for painting. From Edinburgh he proceeded to Paris, and spent four months in hard work at Julien's studio, where Jean Paul Laurens and the late Benjamin Constant were the visitors, and even among the cosmopolitan crowd attracted to this famous atelier the young Scotsman more than held his own. In 1894 he returned to Aberdeen, and began the practice of his profession, filling in his time with work of various kinds, and doing drawings for two of the local illustrated papers—the *Scottish Figaro* and *Bon Accord*. He gained his first success as a portraitist with a portrait of Mr. W. D. Ross, which was exhibited in 1896, and from that day onwards his success has been of a marked character. While still retaining his connection with Aberdeen, he, in 1897, took a studio in 33 Tite Street, Chelsea, in the same building as Mr. Sargent, R.A., who manifested a very friendly interest in him, and he exhibited at the Royal Academy, the New Gallery, the Royal Scottish Academy, and the International Society, and never forgot when it came round the art exhibition of Aberdeen, for which he always kept some of his best works. Last year he was elected an Associate of the Royal Scottish Academy, and it was only about three weeks ago that at a meeting of the Academy he received his diploma. His work was mostly portraits, though in 1898 he exhibited a fancy study of a girl holding at arm's length an image called "Fantasie in Folie," and a landscape with figures, "Twixt Sun and Moon," which showed that he had a fine fancy and much poetical feeling. "Fantasie in Folie" was exhibited at the Paris International Exhibition of 1900, and was awarded one of the few gold medals given there to British painters, while another picture of his, "St. Anne of Brittany," shown in Edinburgh in 1896, was purchased by the Italian Government. Among portraits of ladies from his brush which were greatly admired were those of Miss Julie Opp, the actress, the Viscountess Encombe (posed in profile to the right and wearing a rich red evening gown), which was considered a masterpiece; Mrs. Milne of Kinaldie, and of children's portraits those of Miss Alice and Miss Kathleen Crombie, Miss Edie Edinger and Master Philip Fleming—the boy seated on a spirited black pony—a work which in its breadth and simplicity of treatment recalled the art of Velasquez. Of his men's portraits one recalls his Mr. John Duthie of Cairnbulg, Surgeon-Colonel Gallway, C.B., in military uniform, the Rev. James Geddie, the Hon. Herbert Maxwell, Mr. Justice Vaughan Williams, Mr. John Donald, Aberdeen, and the

Marquis of Linlithgow—the last-named being in the Royal Academy last year. In the Aberdeen permanent collection he is represented by a portrait of Dr. Alexander Ogilvie, formerly head-master of Gordon's College.

Mr. Brough possessed in an eminent degree one of the first requisites of a portrait-painter—style. There was nothing commonplace about anything he ever did; it had always great individuality and variety. He was also gifted with a fine decorative sense of composition and arrangement, could preserve a nice balance in his light and shade, and there was a breadth, simplicity and dignity of effect in his portraits of men and women alike, and in his ladies' portraits a keen appreciation of feminine beauty, which showed he had imbibed to good purpose the teaching of the great masters of portrait-painting. He was a beautiful colourist and a brilliant executant, a little too fond sometimes, in the exuberance of youth, of displaying his technique, but it was a slight fault which further experience would no doubt have corrected. Not many painters could vie with him in the charming bloom and suavity of his flesh tints—a gift which, with his fine sense of style, helped to make him so successful a painter as he was of the portraits of ladies and children. His figures also were always invested with a life-like quality. His last work was the painting of the children of Sir Charles and Lady Tennant of The Glen, and on this he was engaged when he left on his fatal journey to London. Personally, Mr. Brough had a buoyant, cheerful nature, and was a great favourite with all who knew him. He was unmarried. He is survived by his mother, who was with him at the end. He has also an uncle, Mr. John Brough, dairy farmer, Hazelhead, and several cousins.

ARCHITECT'S OFFICES AND SPECIAL LIGHT.

A CASE having peculiar interest for architects has been decided by Mr. Justice Bray, for according to his Lordship's judgment an architect's business is only an ordinary business, and therefore comes under the decision in Colls's case. The circumstances in *Ambler v. Gordon* are described as follows by the *Times*—

This was a special case stated by Mr. Thomas Blashill the umpire appointed by the arbitrators in an arbitration between the above-named parties. The plaintiff, Mr. Herbert Ambler, was an architect, and the owner of certain premises in Cookridge Street, Leeds, and the defendant, the Roman Catholic Bishop of Leeds, was erecting a cathedral opposite. The plaintiff contended that it interfered with the light to which he was entitled, and which had hitherto been enjoyed in connection with his premises, part of which had been used for upwards of twenty years past by the plaintiff for the purposes of his offices, including a drawing-office for which a special amount of light was required. All the lights were ancient except as to the additional amount of light coming through certain new shop-fronts. A slight but not material interference with light was caused to those parts of the plaintiff's premises for which no special amount of light was required. The plaintiff claimed that he was entitled to damages. The umpire awarded and found as follows:—"Notwithstanding the defendant's buildings there remains sufficient light to the plaintiff's premises for all purposes of ordinary user, and the plaintiff is not entitled to damages for interference with such ordinary user; but if I am entitled to take into account damages which the plaintiff has sustained in respect of loss of light to those parts of the premises used for occupations in respect of which a special amount of light is required, then I award 600*l.* damages." At the request of both parties the umpire submitted for the opinion of the Court the question whether on the foregoing facts he was bound by the decision in "*Colls v. Home and Colonial Stores*," and therefore could not award damages to the plaintiff, or whether he could award damages to the plaintiff in respect of interference with such special user of light as aforesaid. It was argued for the plaintiff (1) that the umpire had found that an architect's business was not an ordinary business, and as he had found that the light was insufficient for this business, therefore, according to the law as laid down in Colls's case, there had been an actionable interference with the plaintiff's ancient lights, and the plaintiff was entitled to the 600*l.* damages. In the alternative it was contended that the question whether an architect's business was an ordinary business was a mixed question of law and fact, and the umpire must have misdirected himself or misunderstood Colls's case, and the case ought to be sent back,

aim to have the facts more fully stated. It was concluded (2) that the twenty years' enjoyment had given the plaintiff a right to the special light, and (3) that the defendant agreed to pay for actual damage whether there was or was not a reasonable interference or not.

Mr. Justice Bray, in delivering judgment, said that, in determining the contentions put forward for the plaintiff it was necessary to see what was meant by the expressions which were to be found in the special case and in judgments in Colls's case, "ordinary user," or "ordinary business," or "ordinary purposes." He thought that the word "ordinary" was used solely with reference to light, and an ordinary user or an ordinary business, not a user or business which, in fact, required only an ordinary amount of light. This was a question of fact, and not of law, and it depended on the evidence in each case, and it could not be predicated as a matter of law whether an architect's business or any other business was an ordinary business. He did not think that it was even mixed fact and law; but even if it were, he felt quite unable to see where the plaintiff had misdirected himself, or how he had misunderstood Colls's case. The second point did raise a question of law, namely, whether use or enjoyment of a special light for twenty years gave a right to that special light, and thus enlarged the easement and increased the value of the servient tenement. It was important to observe that the umpire did not state as a fact that the owners of the servient tenements were aware that the premises were being used for businesses that required special light. It was said by the plaintiff's counsel that no evidence was given at the hearing before the umpire about that, and that if it was a relevant fact the case ought to be sent back to the umpire to find it. His Lordship did not agree with that contention. A plaintiff had to prove his case, and if he did not prove a necessary part of his case he must fail. The only fact, therefore, to be dealt with was the use and enjoyment of the special light for twenty years. What did that give a right to, it? This point was not decided in Colls's case, but was referred to in some of the judgments, which, however, there was nothing that assisted the plaintiff's contention; on the contrary their inclination seemed to be against it. There was a dictum in *Lanchester v. Mackenzie* distinctly opposed to the plaintiff's contention if knowledge was not to be assumed, and the reasons there given for thinking that no right could be gained in the absence of knowledge seemed unanswerable. If the origin of the right to light was a supposed lost right or covenant, as the cases seemed to show, who would assume that the owner of the servient tenement intended to grant a special right beyond the ordinary right when he was ignorant of the special user or enjoyment? His Lordship was, however, prepared to go further, and to hold that even twenty years' enjoyment to the knowledge of the servient tenement would not give a larger right. The result of the judgments in Colls's case was to show that the test of the right was whether the obstruction complained of was a nuisance. If one turned to the nuisance cases, did one find any trace of the doctrine that a person carrying on a delicate trade was entitled to more freedom from annoyance than ordinary people because for twenty years his neighbours had been aware of the trade he was carrying on and had left him undisturbed? His Lordship was not aware of any decision that suggested such a proposition, and it sounded absurd. In the judgments in Colls's and other cases it was implied, if not expressed, that in measuring the quantum of light to which the owner of the dominant tenement was entitled, the purpose for which he desired to use or did use the light should be regarded, and did not either enlarge or diminish the easement which he had acquired. It was well observed by Mr. Waugh, in his argument for the defendant, that the special user on which the claim was founded was a user on the dominant tenement, and not on the servient tenement, which was not in any way affected by it. If the doctrine was that laid down in Colls's case, that by twenty years' user all that was acquired was a right to prevent the defendant from building so as to interfere with the light previously enjoyed so materially as to amount to a nuisance, it would be logically inconsistent with this doctrine to hold that a larger right could be acquired. To produce the element of quantum of user would also work inconvenience and cause uncertainty. If the only right capable of being acquired was sufficient light for the ordinary uses of inhabitancy and business, the owner of the servient tenement knew his exact position; he knew within reasonable limits how high he could raise his buildings,

and whether, during the twenty years, it was worth his while to obstruct his neighbour's windows. If a right to special light was capable of acquisition without his knowledge he could not know his position, and if he had notice of some special light being required for his neighbour's business he could not measure the extent with any exactitude. It seemed altogether unreasonable to presume that any man would have made a grant of such an indefinite easement. On the whole, both reason and authority compelled him to decide this point against the plaintiff. The last point depended on the construction of the agreement for reference; but his Lordship could not draw from the words of the agreement any inference that the defendant intended to give up any legal defence. The dispute was whether the plaintiff had sustained legal damage for which an action would lie. The umpire had found that sufficient light remained for all purposes of ordinary user. That finding was substantially the same as that on which, in Colls's case, it was held that no action would lie. His Lordship, therefore, held that the plaintiff was entitled to no damages, and directed judgment for the defendant.

A stay of execution was granted with a view to an appeal.

THE TOMBS OF KNOSSOS.

A COMMUNICATION from Mr. Arthur J. Evans relating to the tombs of Minoan Knossos was read at the meeting of the Society of Antiquaries last week. Mr. Evans's last season's work at Knossos had been largely devoted to the search for the tombs in relation with the Minoan Palace and city. On a hill about a mile north of the Palace a large cemetery was discovered. One hundred tombs were here opened, the contents of which showed that the bulk of them belonged to the period immediately succeeding the fall of the Palace. The civilisation was, however, still high, and the character of the art displayed by the relics found showed the unbroken tradition of the Later Palace style. Among the objects brought to light were a number of bronze vessels, implements and arms, including swords, some of them nearly a metre in length. One of the shorter swords had a gold-plated handle engraved with a masterly design of lions hunting wild goats. The jewellery and gems discovered were of the typical "mature Mycenaean" class, and a scarab found in one of the graves is of a late eighteenth dynasty type. Among the painted ware "stirrup vases" were specially abundant, some with magnificent decorative designs. The tombs were of three main classes:—(a) Chamber tombs cut in the soft rock and approached in each case by a *dromos*; in many cases these contained clay coffins, in which the dead had been deposited in cists, their knees drawn towards the chin. (b) Shaft graves, each with a lesser cavity below, containing the extended skeleton, and with a roofing of stone slabs. (c) Pits giving access to a walled cavity in the side below; these also contained extended skeletons. Unfortunately, owing to the character of the soil, the bones were much decayed, and only in a few cases has it been possible to secure specimens for examination. A certain number of skulls are to be sent to England. On a high level called Sopata, about two miles north again of this cemetery and forming a continuation of the same range, a still more important sepulchral monument was discovered. This consisted of a square chamber, about eight by six metres in dimensions, constructed of limestone blocks, and with the side walls arching in "Cyclopean" fashion towards a high gable, though unfortunately the upper part had been quarried away. The back wall was provided with a central cell opposite the blocked entrance. This entrance, arched on the same horizontal principle, communicated with a lofty entrance hall of similar construction, in the side walls of which, facing each other, were two cells that had been used for sepulchral purposes. A second blocked archway led from this hall to the imposing rock-cut *dromos*. In the floor of the main chamber was a pit grave covered with slabs. Its contents had been rifled for metal objects in antiquity, but a gold hairpin, parts of two silver vases and a large bronze mirror remained to attest the former wealth of such. A large number of other relics were found scattered about, including repeated clay impressions of what may have been a royal seal. Specially remarkable among the stone vessels is a porphyry bowl of Minoan workmanship, but recalling in material and execution that of the Early Egyptian dynasties. Many imported Egyptian alabastra were also found, showing the survival of Middle Empire forms, besides others of early eighteenth-dynasty

type. Beads of lapis lazuli were also found and pendants of the same material, showing a close imitation of Egyptian models. Four large painted "amphoras" illustrate the fine "architectonic" style of the Later Palace of Knossos, in connection with which the great sepulchral monument must itself be brought. The form of this mausoleum, with its square chamber, is unique, and contrasts with that of the tholos tombs of mainland Greece. The position in which it lies commands the whole South Aegean to Melos and Santorin, and Central Crete from Dicta to Ida. It was tempting to recognise in it the traditional tomb of Idomeneus; but though further researches in its immediate vicinity led to the discovery of a rock-cut chamber tomb containing contemporary relics, it was hardly considerable enough to be taken for that of Meriones, which tradition placed beside the other.

Mr. Theodore Fyfe, architect to Mr. Evans's excavations, gave an account of the architecture of the Royal Tomb, accompanied by plans and sections.

CIVICS AS APPLIED SOCIOLOGY.

ON Monday a paper was read before the Sociological Society in London by Professor Patrick Geddes. In the course of it he said:—

Civics is, first of all, concrete sociology. It starts with a descriptive survey of each town, no less definite and detailed than is the naturalist's or the geologist's of his region. Comparison is next needed, and study of the actual stages of development; hence the desirability of studying the cities of each region by descending its river valley from the simplest mountain hamlets through minor towns and cities before reaching the great seaport or metropolis, which has developed not only from its own geographic situation, but from all the simpler communities above. The fundamental rustic occupations—hunting, pastoral, agricultural, &c.—are described by many economists as phases preliminary to the industrial and commercial development of a great city, the imperial and financial order of a metropolis; but we must view our existing civilisation as the complex struggle and resultant of these simple types and their complex developments. Geographic environment, pasture or vineyard, mine or seaport fundamentally conditions occupation; this in turn determines industrial organisation, and this the family type. From this in turn arises the characteristic type of institutions, and from this not only custom, but a tradition of morals and law. In this way we obtain an orderly method for description and comparison, which admits of graphic statement.

As a first and obvious application of this mode of geographic study of cities appears the criticism of the city's plan, and when possible its amendment; the monotonous rectangularity of the American city and the petty irregularity more common in our own being alike uneconomic and inartistic because ungeographic, irrational because irregular. With the improvement of communication the physicist's point of view thus introduced—that of the economy of the energies of the community—is only beginning. The economy of fuel, the limitation of smoke and fogs are further examples of this, and point to a more economic organisation of industrial activities generally. But this next carries with it the improved efficiency of the producers themselves. With these, however, the standpoint changes from the mere economisation of physical energies to the higher economy of organic evolution. The convention of traditional economics, that the productive capacity of the actual labourer is the sole concern of his science, thus gives place to what is at once the original conception of economics and the evolutionist one, viz. that the success of industry is ultimately measured neither by its return in wealth to the capitalist nor in money wages to the labourer, nor even by both put together, but in the results of industry upon the concrete environment, the family budget, the home, and the corresponding state of development of the family—its deterioration or progress. The organisation of industrial groups or of representative institutions found conducive to the well-being and progress of these prime civic units, the families, may next be traced into its highest outcome in city government. The method of analysis and graphic statement thus outlined may be shown to be even capable of useful application towards the statement of the best arguments of both progressive and moderate parties in city politics.

Passing from politics to culture, the needs of this also become clearer, each community developing a broadly

similar series of culture institutions, from the simplest presentation of its geography, landscape and architecture to the complex development of industrial, technical and scientific instruction, and with provision also for the institution of custom and ethic in school, law and church. Just as place, occupation and family are intimately connected in the practical world, so their respective culture institutions must more and more be viewed as a whole. Civic improvers will find their ideals more realisable as they recognise the complex unity of the city as a social development of which all the departments of action and thought are in organic relation, be it of health or disease. The view of theoretic civics as concrete sociology, and of practical civics as applied sociology may be more simply expressed as the co-adjustment of social survey and social service, now becoming recognised as rational, indeed in many cities being begun.

But the preceding view is as yet too purely determinist and the due place of ideals, individual and corporate, in their reaction upon the function and the structure of the city and even its material environment has next to be recognised. For where the town merely makes and fixes its industry and develops its corresponding schools, where its habits and customs become its laws, its morality, the community sinks into routine, and therefore decay. To prevent this a twofold process of thought is ever necessary, critical and constructive; on the one hand, a continual and critical selection of the ideas derived from experience, and the formulation of these as ideals, and, further, the organisation of these into a larger and larger whole of thought, in fact, a synthesis of a new kind. This critical spirit it is which produced the prophets of Israel, the questioning of Socrates, and so on to the best criticism of life to-day, journalistic and other. The corresponding constructive endeavour is now no mere school of traditional learning or of useful information, but of science or philosophy, which sooner or later react upon the view and conduct of life: hence the Academe of Plato, the Lyceum of Aristotle, the Mediæval cloister or the modern research institute have each and all been so fertile in their reaction upon the city's life, from which they seemed to be retired. For instead of simply deriving our thought from experience we now project our clarified thought into action. Similarly in art, we no longer imitate nature nor copy traditional design: art proper appears, shaping bronze and marble into its visions of the gods, and on a burnt and ruined hill-fort upraising the Parthenon. In general terms, instead of simply adjusting, as before, our mental image to the outward facts, we reverse the process, and with a new art conception, be it good or bad, we transform the outward world, like wax under the seal. Similarly for the material and moral organisation of the city, its temporal and spiritual powers; of these the Temple of Jerusalem, the Acropolis of Athens, the Capitol of Rome are Classic examples, and for the Mediæval city, pre-eminently the cathedral. The same evolution is traceable in the history of education, the university, past and present alike, ever finding its germ in the school of local and corporate tradition, but next developing as the cloister of meditation or of research, and finally expressing itself in that great collegiate life, unhappily lost or undeveloped in most universities, but which it has been the special world-service of Oxford and Cambridge in some measure to preserve and continue. These two elements of the complete, or dual city—the town and acropolis—are thus related like the two sides of a coin; and, in fact, throughout history are constantly presented upon the civic coinages.

In conclusion, then, our study of concrete cities is, in the first place, one of orderly geographic developments, but in the second is of the complementary development, that of the ideals, temporal and spiritual, intellectual and artistic, which men are ever projecting into their city's life. We have thus at once a view of historical developments and a wealth of suggestion towards the worthy continuance of these; our applied sociology will be on one side an increasingly economic and utilitarian development, on the other an increasingly idealist development also. The evils of existing city life are thus largely reinterpreted, and if so more efficiently combated; since the poverty, squalor and ugliness of our cities, their disease and their intemperance, their ignorance, dullness and mental defect, their vice and crime are thus capable not only of separate treatment but of an increasingly unified civic hygiene, and this in the widest sense, material and moral, economic and idealist, utilitarian and artistic. For even the most earnest and capable workers towards civic betterment in these many

fields may gain at once in hope and in efficiency as they see their special interests and tasks converging into the conception of the city as an organic unity, and this not fixed and settled, nor even in process of progress or degeneration from causes beyond our ken, but as an orderly development which we may aid towards higher perfection, geographic and cultural alike.

To guide the steps or phases of our civic growth, we must distinguish these. Just as we see the historic city declining, and the manufacturing, the imperial, the financial city as obviously dominant, so may we not also discern the incipient city, at least in its main aspects? Are not these (1) Neotechnic, *i.e.* of finer industries and arts, with correspondingly advancing specialism in sciences; (2) Geotechnic, *i.e.* of arts organised towards rustic and civic betterment (engineering, architecture, hygiene, &c.) with corresponding return towards the unification of knowledge, and (3) Eugenic, in which all these better organised resources of action and knowledge are concentrated upon the elevation of man. Specialised sciences and their returning synthesis thus rise into ethical and social idealism—civics proper; and this now seeks its increasingly clear and concrete expression in the legitimate "Eutopia" of the city, which action must advance if it would not delay. To discern, to define, to promote this realisable Eutopia of our city thus becomes the supreme problem of civics, as its survey was seen to be the fundamental one. The fuller awakening in cities of their existing agencies, their actual citizens, to their opportunities in both these parallel fields, of survey and of service, the calling forth of yet higher activities, individual and civic, are thus the urgent and the hopeful tasks of civics as applied sociology.

ART IN BIRMINGHAM.

ON Monday night was the prize distribution at the Moseley Road Branch School of Art, Birmingham. The Right Hon. William Kenrick (chairman of the museum and school of art committee) presided, and an address was also given by the head-master of the Municipal School of Art (Mr. R. Catterson Smith).

The Right Hon. William Kenrick said that one object which they had in view when the school was built had not been realised. That object, according to the Birmingham *Daily Post*, was the establishment of day classes for drawing and painting, which they hoped would be filled by the advanced pupils of private schools, and that those who, having left private schools, yet showed a taste for drawing, would go there to complete their studies in that building, especially designed for the purpose, equipped with all needful appliances, with beautiful examples, and where instruction was carried on by a staff of highly-experienced teachers. The evening classes, attended by 432, fully justified the establishment of the school. The average attendance had increased during the year, being partly due to the opening of a new class for designers, modellers and pattern-makers.

Mr. R. Catterson Smith, in the course of his address, said it was wise and pleasant sometimes to take stock of themselves, and to ask themselves what they were doing and why they were doing it. It was doubly wise to do this when they were struggling hard amid a rather confusing state of things, and that confusing state of things was just now very common, and particularly so in the matter of education. Indeed, we were in many ways in a state of revolt against worn-out methods or no method. Let them take such an institution as that school, which had been working along smoothly with some changes, not startling, but still changes, and let them ask why the city of Birmingham carried on such a place. Why were they taught to draw, to paint and to model? Mankind spent an enormous amount of time and money and energy in trying to make things nice to look at. It might be very stupid and a great waste of time, but still we would do it; we could not prevent ourselves. And drawing, painting and modelling had a good deal to do with many things pleasant to look at. Beautiful things were put before them to draw, model and paint from; these were often products of nature and often pieces of old art. If they went straight from the elementary school into the factory or workshop to make things which were intended to be pretty or beautiful, they would not be taught to draw or model or paint pretty birds, flowers or well-chosen casts, but would be put to the bench to cut, file, twist and solder things which they had no hand in designing and knew

little about the forms of, and consequently they would do many things they understood little about, and took very little interest in because of the lack of knowledge; and they would have very little chance of improving upon anything they did, except in what was called a mechanical way. To avoid this unsatisfactory state of things it had been thought advisable to establish those schools at great expense to the city and country at large, because the Government supplied funds to enable the schools to be carried on. Let them remember that they did not pay in fees anything but a small proportion of the cost; let them remember that well. They did not in form of fees pay for what they learnt in those schools; but it was hoped they would return sevenfold by their industry, and the beauty they would put into their work in their after life for the teaching they received. It would be quite evident to them that things might be done badly or well, in what was called good taste or bad taste. Those schools were not established to supply people skilled in the "new art style" or whatever style was in fashion, but to teach the best that they could, if possible, what was good to-day, to-morrow, and for ever. These Government municipal schools should set a standard of good taste and excellent work, and should not cater for the fashionable manufacturer or teach in any way what was believed to be inferior as testified by the opinions of the best judges. That was the high and honourable position the city had taken. Art, like religion, was open to many interpretations. In fact, art was closely allied to religion and always had been so. We must never forget what we owed to art in the way of making us happy. If they went to the services in a church or cathedral, they at once came under the influence of art. In fact, art was the medium through which religion was conveyed. Every little story they read, tune or song they sang, was all art—he might go on counting up until they perhaps would think there was nothing else but art in the world. Man's efforts in the art direction were very great indeed. But art might be good, bad or middling, and it was very difficult to say which was good, or bad, or middling. Those schools were started with the idea of "going for" good art. Ruskin, he observed, was one of thousands of writers and thinkers who had devoted their lives to the understanding of what art meant, for our Shakespeare, in his art-play writing, also thought there was a difference between good and bad art, and that it mattered. The Birmingham Corporation were convinced that it was worth while spending thousands of pounds a year to keep the art teaching of the city at a high level; and the School of Art committee were convinced that there was good and bad art, and that the good alone should be fostered. Well, how had they decided to treat what was good art in those schools? Art must in one way or another represent things we saw, and of these the objects of nature were the most beautiful. The more we knew about the things we saw the better chance we had of being able to represent them; and the best way they could get to know those things was by drawing and modelling and painting them. So they gave them in these schools birds, dogs, rabbits, &c., alive, and many things stuffed, as well as flowers and plants. Along with these they gave them a taste of old art—such as was done hundreds and sometimes thousands of years ago. He was more inclined to ask them to look at the old work than to draw from it—because, after all, we did not want to do the old work over again badly—that was to copy it—we wanted, on the contrary, to do work which represented our own feelings in the twentieth century, not the feelings of men who lived 1000 B.C. They found, too, that young people preferred to draw from things they saw about them than from old things they did not understand. They asked their students to draw from natural things, and also to draw them from memory, which was very important. He feared few could tell how many petals a wild rose had, or how the acorn was set on the oak branches, with all our talk of "the rose for England" and "hearts of oak are our men." That was the sort of happy art he was aiming at, and what would alone raise our English art to the level of foreign art. He felt sure we could hold our own with any race on earth if we only tried in the right way. He advised the students to work calmly and with perseverance, and if they had ambition let it be to prove that we could do as beautiful things as our forefathers did. And to parents he would say a lofty aim paid in the long run much better than always measuring things by *£ s. d.* Let them remember that youth was the time to sow the right sound seed in their children's minds. They there were pledged to do

their best to plant in them the ideas which should lead in after life to the highest results. "Let us not be weary in well-doing, for in due season we shall reap if we faint not." The certificates and prizes were then distributed.

THE ANCIENT RUINS IN RHODESIA.

AT a meeting of the Royal Geographical Society, held on Monday in the theatre, Burlington House, Mr. Richard N. Hall delivered a lecture on "The Great Zimbabwe and other Ancient Ruins in Rhodesia."

In his opening remarks Mr. Hall expressed his high appreciation of the work of the late Mr. Theodore Bent at the Great Zimbabwe. The recent researches, he said, had yielded additional internal evidence in support of Mr. Bent's conclusions that the oldest portions of the Great Zimbabwe, and a certain number of ruined structures elsewhere, testified to Southern Rhodesia having once been a colony of the ancient empire of Saba, in South Arabia. Not a single one of the hundreds of ruins in Rhodesia could be said to have been more than partially explored. Many ruins of major importance, some rivalling in certain respects the Great Zimbabwe, had never been seen save by casual travellers, while it still required more than the labour of a lifetime to unearth but a portion of the Great Zimbabwe area. Dr. Petrie informed him that his difficulty in Egypt was not that of means, but of obtaining sites to explore. In Rhodesia they had the sites, but not the means. Research in Rhodesia had always been by unassisted individual effort, and hence it had been spasmodic and without organised system. Sir William Milton, the Administrator of Rhodesia, had shown in a practical form his deep interest in the preservation of the ruins of Great Zimbabwe, but every pioneer bemoaned the preventable dilapidation at many of the most important ruins throughout the country. This was a matter of grave concern for archæologists everywhere, and one that demanded prompt attention. Since 1892 decided progress had been made both at Great Zimbabwe and elsewhere in the investigation of the ancient monuments. Mr. Hall proceeded to describe the advance made during the last three years in researches. Among the researches which had been made were the re-examination of Great Zimbabwe, the re-examination in the light of discoveries at Zimbabwe of ruins elsewhere in Rhodesia, the discovery and examination of numerous and altogether fresh ruins, Mr. Hall's inspection on behalf of the Rhodes trustees of the ruins of the Myanga area, the plans prepared by Mr. Franklin White of certain ruins in Matabeleland and also his recent survey of the elliptical temple; the inspection and reports on some scores of stone-built villages and stone rampart forts on hills of the Makalanga and Barokie, the successful tracing of several additional chains of forts, and the securing of the exact locations within numerous ruins of some 200 relics and "finds" representing periods extending from prehistoric times to within a few score years ago. But while these and other internal evidences had been obtained from the actual ruins, other researches had within the last few years been prosecuted in various quarters from which much additional light had been shed on the origin of the Rhodesian monuments. The progress made and the results obtained, he said, enabled them to pronounce some judgment on certain of the distinct types of ruins to be found in Rhodesia. It might be taken as a very modest estimate that there had been located in Rhodesia no fewer than 300 distinct ruins and groups of ruins; and these, or such of them as were first discovered, were classed by all writers as "ancient," this term having also been applied to many of such ruins which were of Mediæval and even of later times. Probably it would be more correct to say that the term "ancient" as relating to the suggested Sabæan occupation of Rhodesia could only be applied to a few scores of the 300 of Rhodesian buildings, though later investigations might show that certain other ruins were also entitled to rank under the title of "ancient" as so understood. Of this older class of ruins, the oldest portions of the elliptical temple and of the Acropolis ruins, and probably certain walls in the Valley of Ruins, might safely be considered to represent the most ancient form of architecture extant in Rhodesia. But there were many ruins showing distinct forms of architecture and construction hitherto termed "ancient," and once considered to be such, which could now be shown to be ancient in a modified sense only. There existed a further type or class of ruins of certain well-defined style of architecture and construction, which gave evidence of erection at a still later date, and these yielded no relic which, in the opinion

of the highest expert authorities, could date back beyond the thirteenth, fourteenth or fifteenth centuries of this era. To these two latter classes he believed that the bulk of the ruins in Rhodesia belonged. Ruins also existed which had clearly been the work of some comparatively later indigenous people, the construction of which did not suggest any controlling influence of a foreign race. In "The Ancient Ruins of Rhodesia" the authors defined two principal classes of ages of ruins to be found, and these were respectively called first and second period buildings. It was from a consideration of the type of first period ruins alone that authorities could demonstrate that the architecture of the oldest ruins was not evolved in Rhodesia, but was directly imported from the Near East. Looking at the Great Zimbabwe, they found the evidences of ancient civilisation to be abundant. There was overwhelming proof in this direction in the actual walls, in the relics discovered on the lowest floors, and in the "finds" of gold of the early period, and in the character of a religion which constrained the ancients to devote such an immense amount of patient labour and such marvellous constructive skill in the plan, erection and decoration of their temple. The Zimbabwe temple, he said, was now admitted on all hands to be the finest and most intact example of a nature-worshipping shrine known to the world. The mural decoration of the chevron pattern, the monoliths, and also the remains of small towers on the summit of the east wall over the pattern, the great tower of conical form, the platform, and the general plan of the structure—all pointed unmistakably to some knowledge of geometry and astronomy on the part of the builders. The application of these sciences for nature-worshipping purposes was common to the ancient Semitic peoples, whether of Babylonia, Phœnicia, Arabia or elsewhere. The astronomical knowledge of the Semitic race was profound. One had but to glance at the grandly sweeping and massive walls of the temple for convincing proof of a high state of skill in architecture on the part of the builders. Many devices of a people thoroughly conversant with military engineering and defence were the prevailing features of all the Sabæan buildings throughout the country. These, in their ingenuity, massive character and persistent repetition at every vantage point, astonished the best experts of modern military engineering science, and compelled the conclusion that their constructors must have been a civilised race. This was proved also by the minute and delicate engravings on gold ornaments—so minute and delicate that nineteen out of twenty people examining them would not detect the presence of decoration. The carvings on soapstone bowls and beams told of a sculptor's art which was by no means crude, and their gold-mining operations showed that these ancients possessed a wonderful knowledge of mineralogy. The sinking of shafts, the driving of long adits, the avoidance of the more refractory ores, testified to their skill as miners.

"TASTE."

IN his last Academy lecture, according to the *Morning Post*, Mr. Clausen said that a picture began its life when it left the studio. The painter in his work had done something that had expressed what his insight into nature had given him, and that conformed to his standard of taste. People might like or dislike it, but in any case contemporary criticism was of such uncertain value that the picture could not take a definite place for fifty years at least. So, in seeking standards of taste—and there were many—we must go back to the old painters. There were pictures that might in some ways be good but yet were not attractive to us—in fact were repellent—and we call them in bad taste. Taste in a picture was like a naturally good manner in a man, a matter of temperament rather than of clothes. If we chose a friend we liked him to be simple, reliable, without swagger; and so should a picture be—in accord with the best we know. But we were not to imagine that the taste we admired was the only one. Each quality in a picture had its own standard, and in really great works the qualities were balanced as they were in nature. Phidias, Michel Angelo, Raphael, Velasquez, Titian, Rembrandt—these men, by common agreement, were our standards, and theirs was the best work. To the painters we might add Claude and Constable. We might take Raphaël as our standard of taste for composition and generalisation, but for actual painting the standard was Velasquez. The only reference of Velasquez was to nature, and this was the reason of his greater modernity as compared with Raphaël. The

portraits of Velasquez seemed so much closer to us because the art in them was so concealed that we did not recognise it but saw only nature. In Rembrandt we were appealed to by the beauty of light and shadow, and in Titian by the beauty of colour in light.

If we accepted the theory that taste must depend on some standard of truth it did not always follow that truth was in good taste. We saw pictures in the Salon—decapitations, hospital scenes and so forth—that though truthfully painted were repugnant to our senses. Of course, said Mr. Clausen, he did not mean to say that we should paint only pleasant subjects, but that the things represented should be in general accord with the feelings of human nature. And Rembrandt raises this question, for with all his magic his pictures were sometimes repellent, as in the case of the "Butcher's Shop" in the Louvre. Despite its splendid beauty of paint and of colour it could not be considered in good taste. The tavern scenes of Teniers, Jan Steen and Brouwer touched us in the same way, though not so strongly, but we forgave the bad taste because of the qualities of painting and light and colour. If we compared Steen and Brouwer with Watteau we found in one case that all the elements of the picture were poor and mean and ugly, and that in the other they were all chosen to please—chosen for their beauty. When we thought of taste our minds turned naturally to Watteau. Yet Watteau's charm depended much less on his chosen elements than on his technical qualities, his beautiful jewel-like colour and his light and shade. When we compared with Watteau the work of his imitators, who used the same properties, how poor and undignified their pictures seemed. Harmony of colour and truthful lighting were therefore elements of taste. Mr. Clausen justified in the case of Watteau the forcing of his shadows, for in no other way could he have got his brilliant, sparkling lights.

Addressing himself especially to the students, Mr. Clausen said that we all had our ideals, and in trying to get near them nothing was better than self-criticism. Let them—he had done it himself—get a good photograph of some fine old painting and hang it on the wall beside a picture of their own. Let them see which they would tire of first. It was selection and expression that generally made the old work so much better than our own. But it was almost impossible to work without coming under the influence of the taste of our time; we were in the current and could hardly help being affected by it. Some of the greater men were probably but little affected by the current—Hogarth, for example, and Chardin. Nor were Millet and Corot, artists whose work their own times found it difficult to accept, though we wonder at the difficulty now. The difficulty in accepting new views was probably not so much their novelty as a kind of resentment that the current ideals were wrong, for no one liked to be asked to reconsider his ideal. Public taste, of course, rested on the standard made by painters. In fact, it was a question whether there was a standard of taste in painting at all except among painters. The public, with very few exceptions, did not bother their heads about the matter at all, and all the problems that painters worry over interested them far less than an earthquake in China. Exhibitions of pictures in some form were as old as the hills, but the modern development of large exhibitions had brought about a change that was not altogether for good. The painter at these exhibitions was tempted to bid for public rather than artistic approval, and, as frequently at the Salon, the object had been to try who can shout the loudest. There was less of this over here, but yet we said sometimes, "A good exhibition picture—yes; but I shouldn't like to live with it." But what was a picture good for except to live with? The tendency of the large exhibition was to make the painter force the colour of his pictures, to exaggerate their light and shade, to disregard all the modesty of nature, and to be in fact out of taste. All painters knew how subtle was their art, but only as they got on in life could they appreciate the qualities of the greater men. Those who did not paint could not appreciate those qualities—how should they? But the painter had good standards to guide him, and he had only himself to blame if he neglected them and followed the taste of the public, who preferred to see in pictures the facts that they understood rather than the finer qualities that they could not appreciate. Mr. Clausen concluded this the last of his present series of addresses with a further reference to Watts, of whose work he had spoken more than once. "He was, I think," said Mr. Clausen, "the greatest artist of our time."

The attendance at the lectures was unusually numerous.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Glasgow Architectural Association Professor Eugène Bourdon read a paper on "The Education of the Architect." He said that it was only by assisting a good practical architect that the pupil could profit by the theoretical tuition that was imparted to him in school. Without any practice the pupil might become a good draughtsman, an able calculator, but he could never be truly an architect. Still, there was a necessity for schools. Architecture must be taught in all its branches in a school of architecture. School and office training were both necessary, and the question was how to divide a young man's time between school and office. He suggested a four year's course at a day school of architecture, or, where students were unable to attend such a school, they might go to evening classes, and in seven years cover pretty nearly the same ground as a student in the four years' course at a day school.

The Angel Steeple, Canterbury.

SIR,—I shall be glad if you will allow me to state that the application of whitewash to the exterior of the tower would, in my opinion, for scientific reasons be ineffectual and an extremely grave mistake.

It was demonstrated by Professor Church, F.R.S., in his memoranda to the First Commissioner of Works (1901-3), that at Westminster the chief cause of the decay in stonework, consisting of sandstone cemented by carbonate of lime, has been the action on the calcareous matter of sulphuric acid in the atmosphere of the neighbourhood, the result of this action being the production of soluble gypsum and other substances. And I have myself shown, in a paper read before the Chemical Society (Proc. 17 (1901), 201), that a similar action has proceeded to an astonishing extent in some of the upper portions of the fabric of St. Paul's Cathedral; so much so that on the underside of the coping-stone of the stone gallery the gypsum produced during the past 200 years forms a species of stalagmite, in places three-quarters of an inch thick. In more exposed situations the sulphate of lime, being soluble, has been washed away, leaving the Portland stone scarred, pitted and exhibiting other evidences of the erosion it has suffered.

The layer of carbonate of lime left by the process of whitewashing would be subjected to precisely the same chemico-mechanical influences; it would quickly be converted into soluble compounds; the preservative effect could only be a negligible quantity; and there are other reasons for regarding whitewash as a most undesirable and injudicious external application to a glorious specimen of ancient architecture.

Admitting that the air of Canterbury contains less sulphuric acid than that of London, there must be a large and increasing amount of coal burnt in the Kentish city; and the difference in the atmospheric action on buildings is doubtless only one of degree. Moreover, apart from sulphuric acid, rain and carbonic acid alone would possibly exert sufficient solvent action upon the whitewash film, within a brief period, to render nugatory its supposed preservative influence.

For these reasons, Sir, I am an earnest advocate of the treatment with baryta-water recommended by Professor Church. By the action of sulphuric acid in the atmosphere this solution will yield a compound (sulphate of barium) almost totally insoluble in water—unlike gypsum. If the baryta method be not used, I am strongly of opinion that it should be a *sine qua non* with regard to any other process that the result of atmospheric action shall be an insoluble substance.—I am, Sir, yours obediently,

E. GODWIN CLAYTON, F.I.C., F.C.S.

Chemical Laboratory, 32 Holborn Viaduct, E.C.:

Land Transfer.

SIR,—It is gratifying to read in the papers that Mr. Gerald Balfour announced at the dinner of the Leeds Law Society on the 21st inst. that it was not the present intention of the Government to introduce any measure for the compulsory extension of the Land Transfer Act. This disposes satisfactorily of the reports that, apparently on authority, have been in circulation since September last.

It would, however, have been still more gratifying if Mr. Balfour had been able to announce that the Government were now prepared to grant the inquiry into the working of the official system of conveyancing that was to have followed the three years' experimental working of the system in London—a period that expired in December 1901. Why should London alone be saddled with the system if it is not good enough for the rest of the country? Unless the authorities intend that London shall have the system for all time, it is clearly in the public interests that the overdue inquiry should take place at the earliest possible moment.

The facts set out in my letter of the 9th inst. that you favoured me by inserting in your paper are surely sufficient to prove that an ample case is made out for holding an immediate inquiry.—I am, sir, your obedient servant,

J. S. RUEINSTEIN.

5 Raymond Buildings, Gray's Inn :
January 24, 1905.

GENERAL.

An Election took place at the Royal Academy on Wednesday evening, when Mr. David Murray, painter, was selected an Academician, and Mr. David Farquharson, painter, and Mr. Reginald Blomfield, architect, were elected Associates.

Mr. Birnie Rhind, A.R.S.A., has been commissioned to execute a colossal statue in bronze of Colonel Light, the founder of the city of Adelaide, South Australia. The sculptor shows Colonel Light in the uniform of 1830, the figure poised on the left leg, pointing forward with the right hand as if in the act of indicating to his subordinates the site where the town should be, while in his left hand he holds a plan. The statue will be 9 feet high.

A Mausoleum with crypts patterned after the plan of those in Westminster Abbey is to be constructed in Montrose cemetery, Chicago. The structure is to cost 150,000 dols.

Mr. A. E. Powles, architect, Northwich, has been successful in the limited competition for the proposed new elementary school, Northwich, of which Mr. H. Beswick, county architect for Cheshire, acted as assessor. The estimated cost is 10,500*l.* The committee have accepted the plans.

The Royal Institute of Public Health will hold a congress in King's College, London, from July 19 to July 25. There will be nine sections, including one dealing with engineering and building construction:—(a) Municipal; (b) educational. In connection with the congress an exhibition will be held in the Polytechnic, Regent Street, W.

A Series of Lectures, which will be continued weekly till the middle of March, has been inaugurated at the Glasgow Art Gallery. These lectures will deal with the peculiar features of early Dutch art, partly by Mr. Paton and in part by Mr. Rennie, alternating with a series by Mr. Macnair devoted to the geological history of the Clyde valley. The final lecture will be delivered by Mr. D. S. Riddoch, president of the Glasgow Ruskin Society, on Holman Hunt, *apropos* of the famous work "The Flight into Egypt" by that artist, now in the Gallery on loan from Mr. J. T. Middlemore, M.P.

Mr. Holman Hunt announces that he has completed his long protracted and oft abandoned book on the pre-Raphaelite movement. The final reason for completing it is that there has been not only misunderstanding about persons concerned and their priority, but also as to the very nature of pre-Raphaelitism itself.

The Louvre authorities have given to the British Museum a cast of the block of black diorite upon which the Babylonian King Hammurabi, about 2200 B.C., inscribed what is usually called "The oldest code of laws in the world." Professor De Morgan, the director of the French expedition to Susa, discovered it about two years ago.

The Stock Exchange Art Society have arranged for the following lecture to be given at the London Institution:—Sir W. B. Richmond, R.A., on "St. Paul's," on Thursday, February 2, at 4.30.

Mr. Henry Theobald, F.S.I., of 6 South Street, Finsbury Pavement, E.C., desires us to state that he is not the surveyor who was plaintiff in the recent action of Theobalds v. Clements, nor is he in any way related to him.

The Council of the Surveyors' Institution announce that with a view to the encouraging of reading of papers at the ordinary general meetings it has been decided to award a gold medal for the best paper, if of sufficient merit, read during the session.

Applications are invited for the post of secretary of the Surveyors' Institution, Great George Street, Westminster the salary offered commencing at 600*l.* per annum. Particulars may be obtained of Mr. P. Currey, hon. secretary of the Institution, 37 Norfolk Street, Strand.

The Lord Mayor of Liverpool (Mr. John Lea) will open the annual exhibition of the Royal Glasgow Institute of the Fine Arts on Saturday, February 25.

The Buckinghamshire Archaeological Society celebrates its jubilee in July, and arrangements are being made for an exhibition of antiquities from all parts of the country.

The Carnegie Dunfermline Trust offered premiums of 25*l.*, 15*l.* and 10*l.* for plans of a branch library at Townhill, and upwards of sixty sets of plans have been received.

The German Emperor has had a letter written to Dr. Corbould, Kensington, paying a tribute to his father, the late Mr. Edward H. Corbould, R.I., who acted as drawing-master to the Kaiser's mother.

Lady Constance Shaw-Lefevre is making an appeal on behalf of four daughters of the late Marquis de Foulon, who settled in England and practised as an architect. Among the designs in which he co-operated were those of Bridgewater House and the Marble Arch. The daughters were left penniless at his death, and are now unable to support themselves.

The Postmaster-General received a deputation on the subject of the disfigurement of commons, open spaces and places of natural beauty by the erection of lines of posts and wires. The deputation was arranged by the Commons and Footpaths Preservation Society.

The Minister of Education in Italy has, through the Italian Ambassador, tendered the warmest thanks of the Italian Government to the University of Oxford for having so generously gone to the aid of the National Library of Turin with the gift of books, so as to partly lessen the great loss sustained through fire by that institution.

The Memorial to Canon Ainger will take the form of a stained-glass window in the eastern side of the Newton chapel at Bristol Cathedral, as well as a marble tablet, probably in one of the Berkeley recesses in the nave.

The Institute of Archaeology connected with Liverpool University have arranged for a course of lectures dealing with recent researches on the ancient sites of Greece and with the historical geography of Western Asia, particularly Palestine, to be delivered on successive Wednesdays of this spring term in the engineering theatre of the University. They will be copiously illustrated with the lantern. The lecturers are Dr. Caton, F.R.C.P., and the Rev. M. Linton Smith.

Mr. John Murray Scott, the legatee of Lady Wallace, last week sold the château and grounds of "Bagatelle" to the city of Paris. As the first instalment the sum of 2,000,000 frs. was paid. A second million will be paid in 1906, a third in 1907, and a final payment of 2,500,000 will be made in 1908.

Mr. James C. Inglis, general manager of the Great Western Railway, has been nominated by the Council of the Institution of Civil Engineers as one of their representatives on the Engineering Standards Committee, in the place of the late Mr. John Allen McDonald, engineer-in-chief of the Midland Railway.

The Royal Academy will open its summer exhibition on May 1. Friday, March 24, will be the receiving day for water-colours, miniatures, drawings in black and white, architectural designs and all works of whatsoever nature that are sent in under glass. Oil-paintings will be received on Saturday and Monday, the 25th and the 27th, and sculpture on Tuesday, March 28.

The Free Library Committee of Preston Town Council recommends that a stained-glass window by Mr. Henry Holliday be inserted in the central window at the west end of the principal floor of the art gallery at a cost of 300 guineas.

The Tower of St. Andrew's Church, Denton, Lincolnshire, which was built between 1350-1400, was reopened on the 12th inst. after undergoing complete restoration. Owing to dilapidations which had rendered it dangerous, immediate renovation was necessary, and the advice of Mr. Weir was obtained. On his advice the interior of the tower was strengthened by a broad belt of solid brickwork, the exterior repointed, the vane and pinnacles renewed, a lightning conductor placed in position, and the clock regilded.

A Paper on "Designing for Mosaics and Stained Glass" will be read before the Northern Architectural Association by Mr. J. Eadie Reid on the 31st inst.

THE WEEK.

TH inside and outside the County Council there are people who would be glad if it were possible to see the Strand restored back to its former condition. The chase of property and the expenses in connection with the clearance have made building sites so valuable, that latitude must be allowed to those who will acquire them. Already it has been objected that the single building which has been put up, viz. the Gaiety Theatre, is too colossal to be in keeping with Somerset House and the churches. The plans for the Gaiety showed a more expensive building than could be erected under ordinary circumstances. At the London County Council wished to have it still more ornamental. Accordingly an agreement was entered into between the Council and the Gaiety Theatre Company by which it was provided that the company should build in the Strand a new theatre according to plans, elevations, &c., to be approved by the Council, but that if the Council required such elevations to be of a different and more elaborate and more costly character the company should comply with the Council's requirements on condition that the increased cost should be paid by the Council. The extra cost to the company amounted to about £1000. The claim was referred to the arbitration of Mr. A. FRANKLIN, and he has awarded £17,217. together with costs amounting to £716. 7s. There was some dissatisfaction expressed at the meeting of the Council on Tuesday that so much of the ratepayers' money was to be expended on what was called embellishment. And the chairman of the improvements committee could only reply that the buildings to be erected should be worthy of the site. The same law should, however, be applied to other buildings along the frontage. If ordinary business principles are accepted it is impossible to erect buildings that will be profitable to the owners, and at the same time will correspond with any of the numerous plans which have been proposed for adoption. The Council committed one great error in listening to advisers who are indifferent to economy, and the metropolis will have to pay a heavy penalty for that weakness.

IN buying pig-iron in large quantities it is not always easy to fix a definite standard. The ores found in Great Britain are of various qualities according as the carbonates, the hematites and other constituents abound in them. A rough and ready nomenclature exists, and what are known as "mixed numbers" are accepted as signifying a fairly determinate quality. But in all such cases it must be expected that the interpretation of the name will be uniform. A vendor may consider "mixed numbers" applicable to ores which a purchaser believes to be of inferior quality. A difficult case of the kind came to an end before Mr. Justice CHANNELL on Monday. Mr. WATSON, an ironmaster, sought to recover from Messrs. WATSON, of Middlesbrough, balance of an account for pig-iron and damages for breach of contract by not taking the quantity ordered. The case for the defendants was that the iron received was not up to the "mixed numbers" standard, and they were compelled to make an allowance of 1s. 6d. a ton to the people to whom the iron was sold by them. Mr. Justice CHANNELL came to the conclusion that there was not such a standard expressed by "mixed numbers" as was supposed to be generally understood. The defendants were not entitled to anything better than West Cumberland iron, but they were not to be put off with worse. He came to the conclusion that the iron was not of the quality which the defendants were entitled to receive, and the plaintiff's claim for damages was set aside. The

defendants were also granted the 1s. 6d. per ton which they had allowed to their customers. The decision, therefore, unsettles the belief that "mixed numbers" means more than an average product. If a special iron is required, it will be advantageous to have stipulation to that effect which will make the agreement definite when it has to be considered in a court of law.

THE phrase "the engineer for the time being" is tolerably familiar, and is supposed to designate the person who holds a special appointment. If in a deed it were mentioned that something was to be done by Sir ALEXANDER BINNIE, the engineer to the London County Council, or the engineer for the time being, the words would be interpreted as pointing to Mr. FITZMAURICE, who at present fills that office. That the phrase may have another meaning has been exemplified in the case of *STRACHAN v. Cambrian Railway Company*, which came before the Court of Appeal on Monday. The plaintiff was the contractor for two light railway companies which are vested in the defendant company. In the contract deed it was stated that "any dispute which may arise under this contract shall on the completion of the works, and not before, be referred to ALFRED JONES COLLIN, or other the engineer for the time being of the light railway, and his decision shall be final and conclusive." When a dispute arose it was referred to Mr. COLLIN, but he declined to act, partly on account of ill-health and partly through his having a personal interest in one of the lines. The company considered the subject should be referred to Mr. COLLIN's successor, Mr. M'DONALD, who was the engineer for the time being, and this conclusion was approved by the Master of the Court. The case was brought before Mr. Justice BRAY, who held that the engineer for the time being referred to the engineer who was acting at the time of the dispute, or, in other words, to Mr. COLLIN. As he had retired there was no definite arbitrator according to the terms of the contract. The defendants appealed, and the Lords Justices affirmed the decision of Mr. Justice BRAY. The phrase "for the time being" is employed every day, but evidently there is some risk attached to it.

THE discontent which arose lately in Liverpool when it was found that the contract for the new building of the Liverpool Infirmary was given to Messrs. W. BROWN & SONS, of Salford, instead of a local firm, was referred to at the annual meeting of the supporters of the Institution on Tuesday. Mr. ANDERSON considered the charges against the committee were unjust. It appears from his statement that (1) Messrs. WILLIAM BROWN & SONS have premises in Liverpool for which they pay rates and taxes, and can consequently claim to be a Liverpool firm; (2) the contractors are now employing exclusively Liverpool labour on the job, and have promised to continue to do so; (3) the sub-contract for slating and plastering is placed with a Liverpool firm; (4) the sub-contract for plumbing, painting and glazing has been placed with a Liverpool firm; (5) the sub-contract for the ironfounder's work has been placed with a Liverpool firm; (6) the fire escape staircases have been placed with a Liverpool firm; (7) Liverpool firms are to be asked to compete for the boilers and heating apparatus generally; (8) Liverpool firms will be asked to compete for the cooking apparatus; (9) the asphalt used on the job is obtained from and laid by a Liverpool firm; (10) the lime used on the job is obtained through a Liverpool agent; (11) the cement used on the job is obtained through a Liverpool agent; (12) when the furnishing comes to be done local firms will be asked to compete; (13) the clerk of works is a local man; (14) the quantity surveyor is a Liverpool man; (15) the architects are a Liverpool firm. One of the reasons for giving the contract to Messrs. BROWN & SONS was that Portland stone will have to be used for the windows, and their price for stone was the lowest.

ALBRECHT DÜRER.

A VIEW of Nuremberg inevitably recalls the life of its great artist, ALBRECHT DÜRER. As the American poet wrote some sixty years ago:—

Here, when art was still religion, with a simple reverent heart,

Lived and laboured Albrecht Dürer, the Evangelist of Art; Hence in silence and in sorrow, toiling still with busy hand, Like an emigrant he wandered, seeking for the Better Land. *Emigravit* is the inscription on the tombstone where he lies; Dead he is not, but departed—for the artist never dies.

It is now perceived there was a special fitness in his having such a birthplace; for DÜRER possessed so many of the highest characteristics of the German nature he is to be considered as a representative Teuton. But there can be no question he was dissatisfied with Nuremberg, and some of his contemporaries believed he was out of place there. VASARI wrote of him:—"If this diligent, industrious, universal man had been a native of Tuscany, and if he could have studied as we have done in Rome, he would have been the best painter in our country [*i.e.* Italy], as he was the most celebrated that Germany ever had." DÜRER was discontented in Nuremberg, but that to some extent arose from his natural susceptibility to the influences of his time. He could not, however, fail to perceive how different his life might have proved if he had been born in Venice, Rome or Florence. He described himself as being treated by the Venetians as if he were a gentleman, while in Nuremberg he was simply a parasite. "Hie bin ich ein Herr—daheim ein Schmarotzer." Evidently the seeking of commissions was distasteful to him.

The publication of ALBRECHT DÜRER's writings, of which a volume has just appeared in Berlin under the editorship of Herr MAX OSBORN, revives the particulars about the artist's visit to Venice, which was one of the few agreeable incidents in his life. It is generally supposed that he journeyed to the city in order to assert his rights as the designer of a number of plates which MARC ANTONIO had imitated, and to which he attached DÜRER's monogram. In Venice he made acquaintance with ARETINO, "the scourge of princes," who was influential although a young man. DÜRER had also a commission to purchase some jewels for his friend PIRKHEIMER. He was therefore able to study many classes besides lawyers and senators. DÜRER recognised the good qualities of the Venetians. But he adds that they were among the greatest rascals on earth. In conversation with the painters he realised the shortcomings of his own works, in which they discovered no trace of the antique, which in Italy was a serious omission. But there was a novel power in him which they recognised. TITIAN's *Tribute Money* is supposed to owe much to DÜRER. JOHN BELLINI, who was very old, "but still the best in painting," requested the favour of his portrait. An important result of the visit to Venice was the correspondence with RAPHAEL.

To us DÜRER is mainly known through his etchings and engravings. But Lord LEIGHTON said that as a colourist he was rich and vivid, although not always unerring as to his harmonies or alluring in his execution. It is believed he was one of the artists whose works were admired by Lord ARUNDEL, and his pictures must have been familiar to Lord BACON, for he remarked "a man cannot tell whether APOLLO or ALBERT DÜRER were the more trifler; whereof the one (DÜRER) would make a personage by geometrical proportions, the other by taking the best parts out of divers faces to make one excellent. Such personages, I think, would please nobody but the painter that made them—not but I think a painter may make a better face than ever was, but he must do it by a kind of felicity (as a musician that maketh an excellent air in music) and not by rule." DÜRER's geometrising and his endeavour to establish an invariable scale of proportion for the human frame (for which he is said to have been inspired by JACOPO

WALSCHKE), as well as for letters in printing, created prejudice against him with FUSELI, and he declared that DÜRER had shown what was to be avoided rather than what was to be followed. But as a colourist he says that DÜRER "went beyond his age, and has far excelled in truth and breadth and handling the oil-colour of RAPHAEL, as RAPHAEL excels him in every other quality.

That his etchings are still appreciated is shown by the fact that the strange print *The Virgin and Child with Monkey* was sold on Monday last for 57*l.* A representation of the kind would be impossible for an Italian artist, although monkeys were often enough introduced in their works. But DÜRER's monkey, like many other things from his hand, is a mysterious being which each of us can interpret in our own way. To the artist the animal must have given pleasure, for it would be easy to imagine he wished, if possible, to represent every one of its hairs. The blinking eyes also are neither human nor simian in their expression. No artist was more successful than DÜRER in creating puzzles. If we can believe that the *Adam and Eve* dates from 1504 it becomes evident that prior to his Italian journey DÜRER was able to draw the nude figure with marvellous skill. Probably there was an earlier journey southwards, although not attended with any pomp or circumstance. The subject is one which has caused much controversy among connoisseurs.

DÜRER was about twenty years younger than DA VINCI. But there was a curious similarity between the two men. Both of them were handsome, and not unconscious of the gifts which nature lavished on them. Both had a leaning towards science, which was unusual with artists. DA VINCI was born amidst people who were prepared for novelties, and whenever he hit upon an idea he had some chance of realising it. He made drawings for fortifications, and was offered opportunities to have them carried out in masonry. DÜRER's project for military engineering never went beyond the paper stage, unless we accept the legend that a part of the walls and bastions of Nuremberg represent his system. There was, however, one great difference between them. DÜRER was sincerely a religious man, and was eager for the Reformation. His appeal to ERASMUS is by itself sufficient evidence of his travail. DA VINCI apparently gave no attention to subjects of that kind, and it is doubtful whether he was more than a Christian in name. Some believe he was converted to Islamism in Egypt. According to tradition, DÜRER was most unhappy in his married life. There is no record of any marriage of LEONARDO. The financial affairs of DA VINCI caused trouble to himself and to his creditors. DÜRER, if not rich, contrived to keep out of debt and was able to leave money to his wife. The two artists were possessed of the Renaissance spirit in its full strength. They were always aspiring after something which was unknown or had not been attempted. DA VINCI was the more successful, but the difficulties before him were unlike those which were found in Germany. The appreciation of the two seems to increase as time runs on, and with reason, for they are exalted specimens of humanity.

DÜRER became inimical to Mr. RUSKIN because he was always careful to introduce his monogram in the corner of each plate and sometimes rather ostentatiously. But it was a practice among the German engravers, only some of them employed symbols which have had the effect of creating doubts about their personalities. DÜRER was more careful. Then DÜRER was a realist. His Madonnas are unlike those in the Italian pictures. They are, as Mr. RUSKIN truly says, Dutch girls with all the beauty left out. But at the time there was an effort to make Scripture scenes appear as if they were modern incidents, and DÜRER did not rebel against the practice. Lastly, he was scientific, and Mr. RUSKIN was no advocate of the combination of science with art. DÜRER, according to the critic, was too anxious to display his knowledge of anatomy and of optics, and therefore was careless

but what was seen, preferring to suggest what he must exist. His three portraits of great men are therefore bad, "while he forces his soul out to draw the hoofs of satyrs, the bristles of swine, and the distorted aspects of base men and vicious women." It could have been remembered that DÜRER was philo-sophic. He could have formed pretty faces if he cared. Beauty was to him a mystery. The ALMIGHTY, he said, is able to judge of it. He owned the task was beyond him, but suggested that ugliness was within his power. The words seem like a key to the serious faces which DA VINCI drew, as if they were produced more easily than lovely outlines. It was wise in both artists to trouble themselves with such subtleties. DÜRER had the excuse he was a German and disposed to think after the Northern manner, for HAMLET took to etching, his figures might be open to the same objections as those raised against the Nuremberg artist.

DÜRER's house in Nuremberg has belonged to the municipality since 1816, and near it stands a statue by KAUCH. He was buried in the churchyard of St. John, but his grave was not respected and was subsequently assigned to another tenant. His best works are to be seen not in Nuremberg but in Vienna.

PUPILS v. APPRENTICES.

By JOHN HONEYMAN, LL.D.

WHEN the Royal Institute of British Architects decided that examinations should be a qualifying test for membership, it created a revolutionary change in the old system of architectural education, the effect of which seems to be but partially understood even now; and the adaptation of the old methods to the new conditions caused by the change has not yet been effected. Although the effect on the system of pupilage, for example, has been frequently discussed, practically no steps have been taken to make it possible for a young man desirous of passing the Institute's examinations to attend the preparatory classes during his apprenticeship, though it must be evident to any impartial person that the apprentice does not now receive from his master the knowledge deemed essential by the Institute—as he did when the relationship between master and apprentice was instituted—it is absurd to expect that he should give as much of his time to his master as in the days when he got an equivalent for it in the shape of instruction.

This is a point regarding which architects of experience and the Institute itself might reasonably be called upon to advise. Is it not the case that a young man who availed himself of the classes, now so well taught in our larger towns, could pass the three examinations of the Institute without an apprenticeship at all? I do not say that this ought to be done or allowed; but I do say that it *could* be done, and I lay stress upon this in order that we may rightly appreciate the respective values of the office tuition now given, and that which the pupil can and must get outside. It is evident that what he receives outside is distinctly the more valuable of the two, and therefore it necessarily follows that the greater part of his time ought to be spent in acquiring that knowledge, especially till he had passed his intermediate examination.

In apportioning the time to the various branches of study, it is necessary to bear in mind how much there is to dispose of. Here, I think, the majority of architects greatly err in their estimate. My opinion is that a working day of eight hours or nine hours is all that any lad of from sixteen to twenty should have to do. At that time of life a lad cannot do more with advantage or impunity. The whole teaching of the day, therefore, must be done between 9 A.M. and 6 P.M.

There can be no excuse for depriving the pupil of his evening hours. It is to be remembered that we expect the architect to be a gentleman, a man of literary tastes and general culture, a musician, it may be, and

one accustomed to social intercourse; and whether he uses the time for study or recreation we have no right to deprive him of it. It is between 9 A.M. and 6 P.M., therefore, we have to deal with him as a pupil, and can we fairly and impartially say, in view of the relative value of each branch, that half of his time should be devoted to office tuition, such as it is? I think not. It may be expedient, however—as old traditions and customs are hard to eradicate—to allow more, and yet find time for all the academic teaching required within the ordinary working day limit. It would probably suffice if the pupil got free from office work at 1 o'clock on four days in each week and the whole of Saturdays—to allow time for sketching and measuring ancient buildings. He should also have much longer holidays in summer—I would suggest that in each of his two first years he should have a month of holiday, and in the third, fourth and fifth years two months. If we intend to assimilate the architectural student's education to that of other learned professions, we must give to him similar conditions in the way of freedom from routine work, and also similar facilities for the attainment of theoretical as well as practical knowledge of his profession, whether this is to be obtained at schools or universities. Taking this view, to expect our students to have no opportunity of attending classes which are essential, or for preparation for such classes, till the evening after a full day's work has been done, is manifestly absurd.

As the acquisition of instruction given in our schools of art and technical colleges is now essential for the student who wishes the Institute's certificate, the continuance of this sweating system, so fraught with risk to the health and eyesight of our young men, must be regarded as discreditable to us architects.

It must not be inferred from what I have said that I undervalue the advantages of apprenticeship. On the contrary, if the choice lay between apprenticeship and what may be called academic training, I would unhesitatingly pronounce in favour of the former—that is, apprenticeship of the old-fashioned type, during which the master personally instructed his pupil, or at least saw that he was systematically instructed. But the practice now common of architects taking half a dozen or more apprentices at a time tends to reduce the value of the office training, and so it is almost necessary now to supplement such training by instruction which can only be obtained outside. But if a change in the system of apprenticeship necessitates the attendance of the student elsewhere for instruction, it follows that the time devoted to office training must be curtailed. In short, the system as a whole must be modified and harmonised, a fair proportion of the time available being devoted to each branch of study. But, it may be said, if our apprentices are to be at our offices only little more than half time, how are we to get all our tracings made, our printing, mounting, going messages, holding tapes and the like? That is a question very easily answered. Get one or two additional message boys and pay them for their work. By the course I advise you will all the sooner get more valuable services from your apprentices, which will amply repay you for the privilege you give them of working in your office. But it may again be urged, if young men get away from their offices they will go and amuse themselves and acquire indolent habits. But that does not follow. Only those enrolled in classes should be allowed to leave, and for the rest—those who trifle their time are welcome to do so; they will never be architects and they can be quite well spared. It would be a bad business for us if every apprentice became an architect. The lads who are destined to succeed will not trifle. They will not merely make the best use of the time they get during the day, but will devote much of the spare hours they have at command to study—working late and rising early, and improving every opportunity of gaining fuller knowledge of the art they love.

MUNICIPAL ENGINEERING.*

MANY complaints have been heard of late about the indebtedness of municipal corporations. Even the bankers who are familiar with financial catastrophes profess to be alarmed about its effects. It is true there are cases where the expenditure was unwise. Any man, for instance, who has acquaintance with property cannot look at the place which was destined for the Strand Improvement without realising that the change was brought about before the Metropolis was sufficiently ripe for it. The position is not adapted at present for expensive buildings, and the money expended must long remain without any return. In less important towns the vaulting ambition of members of councils who wish to claim credit for being in advance of their contemporaries has also produced results which, if measured by a financial scale, are disastrous.

On the other hand, there can be no question that the larger part of the outlay has been expended beneficially. Streets have been improved; efficient drainage has become general; water supply is more ample and entails less risk for the users, and, in a word, town life in Great Britain does not mean the sacrifice of a large number of human victims every year. It is true that in carrying out the works ruin has been caused which antiquarians and lovers of the picturesque may deplore, but unfortunately it seems to be a rule of life that every beneficial change must be unsatisfactory to more or less people.

At such a time it is an advantage to have an explanation of what has been achieved in municipal engineering. Mr. MAXWELL, in the three lectures which constitute the volume just published, confines himself to (1) road engineering and maintenance; (2) main drainage, sewage disposal, destructors; (3) water supply. He prudently avoids "those branches which by many are considered (whether rightly or wrongly it is not our present purpose to determine) to fall within the category of 'Municipal Trading.'"

There was a time when all the work of road-making and street-making was performed by hand labour. But in a few years we suppose H. WALLIS's pathetic picture of the dead stone-breaker, which RUSKIN considered to be the picture of its year, will hardly be understood as an exact representation of the preparation of material in the nineteenth century. Streets and roads are now subjected to such extraordinary traffic, the work could hardly be performed without the aid of machines. Quite recently we saw the co-operation of six men was required to raise a few paving stones in one of the narrow but busy streets of the City. The steam-roller had done its work so well the paving was as firmly united as any masonry in an arch. There are various other machines, such as scarifiers, and one of the latest brought out is a road edge-dressing machine invented by the road surveyor of Elgin. One great advantage of Mr. MAXWELL's book is that he introduces illustrations and descriptions of the various aids with which mechanical engineers have endowed the authorities for roads. There are also artificial pavements which claim special advantages. Scavenging machines, street-watering machines, road motors further co-operate in giving facilities for traffic.

The second lecture treats of drainage. The joints of sewers have been made the subject of many patents. Beside salt-glazed stoneware, rock concrete, silicated stone, steel-ribbed concrete and ironware pipes are also employed. Concrete and expanded metal have been recently utilised. The author particularly refers to Messrs. WALTER MACFARLANE & Co.'s traps, &c., and says:—"This firm also supplies every kind of iron fitting or appliance required in a complete system of house drainage. The castings are dipped in Dr. ANGUS SMITH's solution, or treated with MACFARLANE's im-

proved glass enamel, which latter renders the interior as smooth as glass, prevents rust, and is also a specially useful application for soil pipes." The design of a penstock used at one time to offer considerable difficulties. But manufacturers now supply them of large sizes, and some are self-acting. The hydraulic sewer-flusher by Messrs. MERRYWEATHER is found to be efficient, and an engine is not needed whenever there is a sufficient pressure from the main. Messrs. HUGHES & LANCASTER have devised an arrangement which is adopted in districts where the sewage must be raised. It is employed in many parts of the world, and a large contract for the drainage of Oporto has been entered into. The view of the station at Bombay is by itself sufficient to indicate the character of the power as well as the ease with which it can be increased whenever required. There are so many solutions of the sewage disposal problem it would be difficult to say which deserves preference, and, indeed, local conditions demand special adaptations. For the disposal of domestic and trade refuse, MANLOVE, ALLIOTT & Co.'s destructor as erected at Liverpool, Shoreditch, White-chapel and other places has proved to be well adapted.

Mr. MAXWELL refers to the great activity which the provincial cities have shown in obtaining possession of gathering grounds for water supply. To some extent this means a monopoly by a few, and the question is, what is to be the fate of towns which have not displayed so much hustling? In the days of BATEMAN and HAWKESLEY it was not difficult to arrange a water supply. The main point was, like Mrs. GLASSE's cook, to first catch the hare in the shape of a sufficient catchment basin, and to lay down a conduit from it to the reservoirs. An engineer found no difficulty in discovering sources of ample supplies; indeed, as in the case of Glasgow, they were almost obtrusive. Inventiveness was so little needed that extraordinary importance was attached to the ingenuity of forming a small conduit along the slope of a weir, in order that in times of flood the water would be likely to pass over without filling it, and turbid water would therefore not be conveyed to the reservoirs. Now, however, there are many important appliances invented outside the engineer's office, and which are found to be indispensable. What can be done by means of artesian wells is shown by a photograph of one for the Great Northern Railway near Peterborough station, sunk by Messrs. LE GRAND & SUTCLIFF, and which yields 300,000 gallons a day. The volume is so great it almost appears to have adhesion, and is not dissipated as so often happens. The great advantage of Mr. MAXWELL's book is that it will be a revelation to many of the extent of the co-operation of manufacturing firms in promoting "the safety and the health of the whole State." This is a debt which is too often ignored. The book is therefore of service as a record, and to some extent as a directory.

PIPE FLANGES.

IN theory the proportions of a pipe should correspond with the extent of the delivery for which it is intended. In German books on construction we find elaborate formulæ for calculating the proportions not only of large pipes or conduits for water supply, but for very small pipes meant to convey gas into houses. It is not intended, we suppose, to have extreme exactitude in the dimensions of pipes. The law of demand has already determined the sizes, and in the market a great variety is to be found. For the Glasgow Waterworks BATEMAN specified pipes which would vary by inches from 2 inches to 10 inches, and then generally by 2 inches from 10 inches to 20 inches. The largest sizes were 24 inches, 30 inches and 33 inches. To some extent that arrangement is still respected.

The Engineering Standards Committee could not, therefore, make many changes relating to the internal diameters of pipes. They suggest, however, that for

* *British Progress in Municipal Engineering.* A Series of Three Lectures by William H. Maxwell, borough and waterworks engineer, Tunbridge Wells Corporation. (London: Archibald Constable & Co., Ltd.)

general use $1\frac{1}{4}$ -inch, $4\frac{1}{2}$ -inch, 11-inch, 13-inch, 17-inch, 19-inch, 22-inch and 23-inch pipes should be dispensed with. They recommend that there should be four standards, viz. (1) low-pressure standard, for steam pressures up to 55 lbs. and water pressures up to 200 lbs. per square inch; (2) intermediate-pressure standard, for steam pressures over 55 lbs., but not exceeding 125 lbs. per square inch; (3) high-pressure standard, for steam pressures over 125 lbs., but not exceeding 225 lbs. per square inch; and (4) extra high-pressure standard, for steam pressures over 225 lbs., but not exceeding 325 lbs. per square inch. The pressure for water pipes of 200 lbs. is usual in this country, but in America one of 300 lbs. per square inch is generally prescribed. The purpose of the committee is to obtain uniformity in the flanges of pipes, and it is well to state the principles which guided them in their own words:—

Number of Bolts.—In the first place, it was decided that the number of bolts used should in all cases be a multiple of four, and that the bolt-holes should be so placed that spaces between them are bisected by the main centre lines. The committee are quite aware that in the case of flanges for certain sizes of pipes, and especially of those for $2\frac{1}{2}$ -inch pipes, the adoption of multiples of four for the number of bolts involves some change of practice; but, after carefully discussing the opinions and experimental data brought before them they are convinced that the advantages resulting from the adoption of such a principle outweigh the disadvantages.

Bolts.—For determining the sizes of bolts it has been assumed that, in the case of a joint just on the point of leaking, the full working pressure might be exerted over the area of a circle just touching the inner sides of the bolt-holes, and the sectional area of the bolts at the bottom of the threads has been fixed to meet this contingency. In the case of the smaller sizes of pipes, allowances have also been made for undue stresses in making the joints. It is considered desirable that all nuts should be chamfered on the side bearing on the flange, and that the bearing surfaces of the heads, nuts and flanges should be trued.

Sizes of Bolt-holes.—The sizes of bolt-holes decided upon were:—For $\frac{1}{2}$ -inch and $\frac{5}{8}$ -inch bolts the diameters of the holes to be $\frac{1}{16}$ -inch larger than the diameters of the bolts, and for larger sizes of bolts $\frac{1}{8}$ -inch.

Diameters of Flanges.—Practically the sizes of flanges are governed by the necessity of adopting such diameters as will meet the requirements of makers of stop-valves and similar fittings. The diameters decided upon by the committee are the smallest which will satisfy these requirements. The requirements of the valve-makers agree very closely with those which exist in the case of cast-iron pipes, or in pipes with rivetted-on flanges; while in the case of pipes with welded-on flanges, although the diameter of such flanges might be reduced, there are manifest disadvantages in having two sizes of flanges when connections have to be made to valves or other fittings. Experiments have shown, however, that with these welded-on flanges the strength of the joints is materially increased by reducing the size of the flanges, while the cost is, of course, also diminished. Under these circumstances the committee consider that in the case of long lines of pipes having welded-on flanges, it should be permissible to make such flanges of the dimensions given in Table III.

Thicknesses of Flanges.—In the opinion of the committee, the standard thicknesses tabulated for the various types of flanges are the minimum thicknesses consistent with satisfactorily meeting the requirements of ordinary practice.

From the tables which are given a few cases may be abstracted which will show the differences between the standard dimensions and those commonly employed. Take a 2-inch pipe. The ordinary diameter of the flange is $6\frac{1}{2}$ inches, the diameter of bolt circle $4\frac{7}{8}$ inches; the standard is 6 inches and $4\frac{1}{2}$ inches. For 4-inch pipes the diameter of the flange is 9 inches and of the bolt circle 7 inches; in the standard the sizes are respectively $8\frac{1}{2}$ inches and 4 inches. In the 6-inch pipe the ordinary diameter of the flange is 12 inches and of the bolt circle $9\frac{5}{8}$ inches; the standard figures are 11 inches and $9\frac{1}{4}$ inches. In the 12-inch, for 19 inches and $16\frac{1}{4}$ inches we have 18 inches and 16 inches. For the 6-inch pipe eight bolts are substituted for six. The 12-inch pipe

has twelve bolts instead of eight, and the 20-inch pipe sixteen bolts instead of eleven.

From these figures it will be evident that there is an alteration in the flanges. The thickness of the metal did not come within the scope of the committee's inquiries. The sub-committee have found it necessary to hold twenty-four meetings in order to consider the information given by manufacturers and users of pipes. A great many experimental tests were also carried out for them. The manufacture of pipes is one of the most important of British industries, and the adoption of uniformity in the flanges must be productive of economy while it will also be advantageous for users.

CHICHESTER CATHEDRAL.

A MEETING of the Great Chapter of Chichester Cathedral was held in the chapter-house last week "for the purpose of conferring upon the affairs of the cathedral church, its fabric, ordinances and statutes." From a report of the proceedings supplied by the Chapter clerk (Mr. Freeland) the following is taken:—The Dean of Chichester presided at the meeting, which was held in the chamber which for several centuries has been used as a muniment-room for the documents belonging to the Bishop and the Dean and Chapter. There is no doubt, however, that this was formerly the chapter-house erected by or under the auspices of Bishop Langton (1305-38), and frequently alluded to in the Cathedral Act Books as the upper or bishop's chapter-house, and it is understood that this chamber will henceforth be used and known as the chapter-house of Chichester Cathedral.

The chamber, which has been well warmed and lighted, has been partly restored by having the oak panelling at the west end renewed, while the President's chair has been restored to its proper place, the bulk of the muniments removed, and a number of the ancient pictures and prints belonging to the Dean and Chapter collected and displayed in the chamber.

The Dean, after reading prayers, shortly opened the proceedings. The agenda was a long one, and the first subject was the further discussion of the *ordo prœdicandi*.

The Domus Fund.

The state of the Domus Fund was the next subject for consideration, and the Dean explained the report and account which had been circulated among the subscribers and detailed the work done during the year. The works carried out by the Domus Fund during the year, besides the general yearly restoration of different parts of the cathedral, comprised among other things the re-erection of Bishop Stratford's sacellum, now nearly finished, the partial re-erection of the Arundel screen, repairs to the triforia, &c., removal of the reredos, and a large contribution to the repairs to the cathedral organ.

Removal of the Reredos.

The removal of the reredos as a separate subject then occupied the attention of the Chapter, and the Dean explained at some length that, although at the preceding Chapter there had been a general expression of opinion that room should be found for it in the cathedral, as in itself it was no mean work of art, it had been found impossible to do so. Mr. Somers Clarke, the cathedral architect, as well as Mr. Kempe, also an expert in cathedral buildings, had both separately examined it and had taken measurements and endeavoured to find a place for it, either in the north transept or elsewhere; but wherever they proposed to put it the expert evidence was that it would prove an eyesore, and the Dean and Chapter reluctantly came to the conclusion that it must go elsewhere.

The Dean explained that at first he thought a place might be found for it in the Colonial Church, and that it might be sent to adorn Cape Town Cathedral, but upon consideration this project had to be abandoned. The Vicar of New Shoreham then asked for it to be placed in New Shoreham Church, and the Dean and Chapter would have been willing to remove it there, but on the measurements being taken it was found that New Shoreham Church could not contain it. Canon Sanderson then endeavoured to find a place for it either in the chapel at Lancing College or at Ardingly, or in that at St. John's, Hurstpierpoint. The authorities were willing that it should be removed to one of those places, but again, on measurements being taken, &c., it was found to be wholly impracticable. When these pro-

posals had to be abandoned. Mr. Marona, the vicar of St. Saviour's, Brighton, applied to take it for his church. The church being a modern one, in which there would be nothing incongruous in the introduction of the reredos, the Dean and Chapter accepted Mr. Marona's offer, and he undertook to find 100*l.* towards the cost of removal if the Dean and Chapter would find the balance, which they had agreed to do. The removal has now been accomplished, and the reredos looks exceeding well where it has been erected. Thus, the Dean said, that which had long been an incubus in the cathedral had been removed and replaced by the old altar screen re-erected in memory of Archdeacon Mount, with the most satisfactory results.

Prebendary Pennethorne, who at the previous meeting of the Chapter had expressed a strong hope that the reredos might be retained in the cathedral out of reverence for the memory of the late Dr. Swainson, who had largely interested himself in its erection, now expressed his entire approval of the alterations which had been made after full consideration, and moved the adoption of the Dean's report upon the subject, which was seconded by Prebendary Hodges and carried unanimously.

The Mount Memorial.

Canon Masters was asked to make a statement as to the Mount memorial, and as the secretary for the memorial committee he stated that the whole amount required for the erection of the screen in its present form had been realised, and that it was hoped there would be a balance over towards further developments; but the committee had been unexpectedly met by a bill for extras sent in by the contractors, and until the return of the architect to England the accounts could not be finally presented.

Archdeacon Elwes asked whether it was not intended further to decorate the screen, and it was explained that the full intention of the Chapter was that a reredos should be erected some day, and, when this was done, that colour and gilding should be added so as to make the screen a more complete reproduction of that which had existed in the same situation from Bishop Shurburne's time down to the fall of the spire.

Canon Jones stated that many people had expressed an opinion that as the screen now existed it was too dignified and severe, and in his opinion it certainly required further embellishment.

The West Porch.

The next item on the agenda was that of the west porch. The Dean stated that Archdeacon Elwes and himself were trustees of a special fund of 500*l.*, which had been left by the late Mr. France, a member of an old Chichester family, to be applied especially to the restoration of the west porch and west front. The Dean then detailed the extensive work which had been done, and how the old work had for the most part been put back stone for stone, that the cracks which had appeared had been carefully watched, and it had been ascertained after two years that there was no settlement, that the foundations were in perfect order, and that the careful work of restoration which had been done would last with care for many years.

Prebendary Bennett then explained in further detail what had been done, and raised a laugh by stating that the Society for the Protection of Ancient Buildings had come down and had expressed an opinion that there had been a decided movement of the building towards the west. But the clerk of the works for the north-west tower had very carefully examined and plumbed the building, and stated that what movement there was was towards the north. But this had now been arrested in the most clever manner, and he thought the work which had been done by Mr. Vick was most satisfactory.

The Dean stated that the 500*l.* legacy was still intact at the bank and earning interest, the Domus Fund having temporarily lent the amount required for the work up to date.

Archdeacon Elwes moved that the Dean's report be received and adopted; this was seconded by Canon Deane, who expressed the opinion that thoroughly good work had been done. The west porch is now securely fixed between the buttresses formed by the north-west and the south-west towers, and the building is now quite safe.

The Bell Tower.

The Dean then explained that the bell tower was more properly the work for the restoration committee of the cathedral, who had taken it in hand; that a great deal of very careful work had been done, and that the experiments which had been made with baryta water were

successful; and the architect proposed in the summer to take this matter in hand with a view to the whole external face of the tower being treated in this way, so as to preserve the stone from further ravages. The campanile south-west pinnacle had been entirely rebuilt, and the three others would next be taken in hand. The Dean and Chapter were fully alive to their responsibility with reference to this ancient campanile, which was the only one of its kind in England connected with a cathedral, and the work would be steadily pushed forward. A meeting of the restoration committee would be held in February to consider the matter further. He moved that his (the Dean's) report be adopted, which was seconded by Prebendary Short and carried unanimously.

Arundel Screen.

The subject of the Arundel screen was then discussed, and the Dean called on Prebendary Bennett to explain in detail what was taking place, how the stones which had been littering in the cathedral and in the bell tower since the fall of the spire had been carefully gathered together, that the screen was being re-erected stone for stone in the base of the tower, that many people who had seen it in course of erection had been astonished at the beauty of it, and that Mr. Kempe had said that if this had been retained in the cathedral the latter would now be almost on a level with Westminster Abbey.

Prebendary Bennett then explained that when arranging the stones for the Arundel screen, those relating to Bishop Stratford's sacellum, a monument erected in the cathedral in 1356 or thereabouts to Bishop Stratford, then Lord Chancellor of England, had been discovered carefully stored, numbered and put away, and that the Dean and Chapter had at once decided that this must be re-erected, and the work was now nearly completed; and it had only been necessary to supply a very few new stones, nearly all the old ones having been found and restored to their original position.

Prebendary Fraser and Chancellor Davey both expressed their satisfaction at what was being done and how well they remembered these ancient edifices when they stood in the cathedral.

The report on this subject was then adopted.

The Chapter-house.

The new chapter-house, or rather the old chapter-house restored to its original use, was then discussed, and the Dean explained that there had been considerable difference of opinion as to whether this was the chapter-house of the cathedral, but he had no doubt that it was originally intended for the chapter-house—at any rate it was adopted as the chapter-house now, and he hoped would always remain. It would be remembered that it had been stated by Prebendary Bennett at the preceding Chapter that there was a precedent for an upper chapter-house in St. David's Cathedral, and that during the summer he (the Dean) had visited St. David's Cathedral, as also had Prebendary Bennett, and seen the chapter-house there, which was similar in many respects to the one which had been brought to light in Chichester Cathedral. He explained how the President's chair and the panelling had been restored, and stated that the key of the old treasure-house over the south porch, which led out of this chamber, and had been in the library for 250 years, had been oiled and fitted into the lock, and it was found that the lock was perfectly good, and the key had now, after this long period, come into use again and become one of the curiosities of the cathedral.

Removing the Muniments.

The Dean also alluded to the labours of Prebendary Bennett, who had collected the pictures, prints, &c., now displayed on the walls, and had taken infinite trouble in restoring the chapter-house to its present condition; and said that some day it was hoped that the panelling would be extended so as to cover the north and south walls, and that stalls would at the same time be provided for the members in the chapter-house.

The Dean then moved the adoption of the report, and this was seconded by Canon Jones. Prebendary Bennett then addressed the Chapter, and after detailing the steps he had taken in reference thereto, he explained that the bulk of the muniments had been removed to the chamber over the canons' vestry, and the remainder, namely, those in more modern use, stored at the east end of the chapter-house, where they could be conveniently reached by the Bishop's Registrar and the Chapter clerk and his assistants. He then expressed his thanks, and he wished the Chapter to

add theirs; to the Chapter clerk and his assistants for the great trouble and labour they had been at in removing the monuments, and the assistance they had given to him, and proposed a hearty vote of thanks to them for their labours, which was seconded by Prebendary Foyster.

Access to Documents.

Before, however, this subject was proceeded with, Canon Jones rose and proposed a vote of thanks to Mr. Bennett, which was seconded by Prebendary Mallaby. These resolutions were put by the Dean and carried unanimously.

The Chapter clerk, in returning thanks, explained that he had no doubt that this was the chapter-house erected by or under the auspices of Bishop Langton, as the records all pointed to this; but it had been the muniment-room of the cathedral documents for several centuries, and he had been obliged to demur to the entire removal of the documents from this chamber, inasmuch as they were in weekly or daily reference by himself or his assistants, and they must be kept in a chamber where access could be had to them at all convenient hours.

Prebendary Bennett then returned thanks for the vote which had been accorded to him, and some further discussion subsequently ensued, when several prebendaries wished that steps should be very shortly taken for the panelling and completion of the remainder of the room. After a remark by the Dean that this subject required careful consideration, the matter dropped.

The Cathedral Organ.

Canon Masters was then called upon to report as to the cathedral organ, when he made the satisfactory announcement that he had succeeded in collecting every shilling that was required, and that the restoration approved by the experts had been satisfactorily carried into effect and that after paying everybody a balance was left in the bank of 12s.

ETHICS AND ÆSTHETICS.

ON Monday Mr. A. Gilbert, R.A., delivered a lecture at the Royal Academy. After a brief reference to his absence from England, he spoke of the lectures on Greek art which Professor Waldstein will deliver at the Royal Academy in March. Those lectures, he thought, should be of great value to the students, whom he proposed to prepare for them in some degree by his addresses. He would speak chiefly of ethics and æsthetics. Ethics was to the commonwealth what æsthetics was to art, and the two together formed the ideal of the philosopher's dreams—the best that could be given for human welfare. With these might be combined beauty and ideality, and the ideal must be with them sleeping and waking. It was the one big gift, the thing that would teach them the shortest road to beauty. Ideality, brought about largely by religious influence, was one of the principal characteristics of Greek art, and it was that which produced the Phidian marbles—the works by which our standard has been set. After commenting on the influence of Greek art on modern work in Europe since the exhibition of the Elgin marbles in London, Mr. Gilbert, according to the *Morning Post*, spoke of its effect upon Watts—a painter, a poet, a sculptor and a greater man. The Greek influence could be seen in everything connected with this great prophet in art—in his life, in his sympathies, even in his letters. He remembered Watts telling him that when he was a youth he went to see and sketch the Elgin marbles when they were first shown at a house in London. He was coming out when someone tapped him on the shoulder, and after looking at his drawings from the marbles said, "You are quite right. Study those and you can't go wrong." The speaker was Benjamin Robert Haydon, a man who lived with the greatest ideals and died in the greatest misery. And Watts afterwards founded all his art—to use his own words—on the lines of the Theseus and the Ilyssus. That was why Watts was the great man of a great century. The great Italians of the Renaissance, less confined by their religion than were the Greeks, were frankly humanists, but showed in their work much of the Hellenic idealism. The idealism was especially remarkable in the portraits by the Italian painters. Michel Angelo had never seen Greek sculpture, yet he, because he was the fittest man to be the intermediate between Phidias and our own times, handed on the gifts his great forerunner had left to the world. The finest things by Michel Angelo were worthy to stand by those of Phidias. Donatello and Verrocchio were both essentially masters of humanism, and Donatello, of all

the Italian sculptors, was the most sentimental. He did not show his wonderful sentiment in his handicraft, in which he was below Verrocchio and Ghiberti, and very far indeed below Michel Angelo and Cellini. In borrowing from nature they should take the best side of their models, and try to see the inner man and show what of the beautiful was in him. That was a lesson that Watts, a great painter, had shown better than any sculptor. His portraits were biographies of the sitters and would outlast any mere material representation.

Flaxman was probably the greatest designer we ever had. Among his collected works at University College were preserved many of the innumerable little sketches of people and things that he made on all sorts of odd pieces of paper. This constant study of nature he combined with that of the people pictured on the Greek vases. So, in his illustrations, Flaxman was able to bring the Greek poets to our comprehension. He was the Donatello of his time, the forerunner of Watts, and the disabuser of the idea of mere material quality conveyed by the art of Banks, Nollekens and Roubiliac. Students probably would not agree with this, nor would he have done so when he sat in their places. To the student in art the man who could execute always seemed greater than the man who could design. The lecture was brought to a close with a few remarks on an English sculptor whose work has been the subject in modern years of general admiration and the cause of endless disputes. Alfred Stevens, said the lecturer, had many personal characteristics. No man living would dare to walk covered into a room before the personality or the work of Alfred Stevens, but nine out of ten who saw his work would say of the execution, "We could do better than that in the schools." Stevens was not a master of execution, but a dreamer. He formed himself on Michel Angelo, who was his bread and his life.

SHEFFIELD SOCIETY OF ARCHITECTS.

AT the last meeting of the Sheffield Society of Architects and Surveyors a paper was read by Mr. H. L. Paterson on "The Geometrical Period." It was pointed out that the fusion of the Saxons and Normans into one people and the gradual separation of England from France allowed each nation to pursue its own ideals and the architecture of each to assume a national character. It was in ecclesiastical architecture that the greatest development took place. The monasteries were the only places in which men could be trained, and in these the large stores of wealth gave them the opportunity of exercising their artistic faculties by erecting noble buildings. By the beginning of the thirteenth century the style known as Gothic was firmly established throughout Western Europe. This style, in which the greatest constructive skill was required, and in which the principle of elasticity was fully and consistently developed, contrasted with the architecture of the Greeks, in which dead height was the most marked characteristic. The practice of concentrating the thrust of a vaulted roof on large masses of masonry, the thrust being often carried across intervening space by flying buttresses, allowed the intervening wall to be largely dispensed with so far as any constructive purpose was concerned, and left it free to be utilised to the full for windows. These became large and more elaborate, and the increasing use of coloured glass hastened the process. Tracery, the progress of which was the most characteristic feature of the Geometrical period, had its germ in Romanesque and Byzantine times, and during the Norman and Lancet period which followed the evident desire to decorate the plain stone spandrels, as well as the desire to secure more light, led step by step to the piercing of the stonework. This took first the form of pierced plates, the stonework being reduced until it took the form of bars or mullions. When the common use of foliation or cusping was completely developed tracery was brought in. The lecturer showed some of the steps by which this development took place, in vertical windows and also in rose windows, and how eventually a traceried window included both types. The different kinds of cusping were noted, and also the change from a purely geometrical treatment to one in which intersecting bars and a combination of the two kinds led to the culmination of the style. Slides were shown also to call attention to the change which took place in the mouldings and also in the ornament during this period, and the lecturer concluded by calling attention by means of illustrations to some of the differences between English and continental work.

NOTES AND COMMENTS.

As architectural societies, regardless of the dignity which they claim and of the practice which prevails in other professions, have become advertisement agents and tolerate deluding promises by their subordinates who hold out prospects of contracts under liberal conditions, it is not surprising that individual architects endeavour to follow the example of the societies. The extent of this traffic in America can be judged from the following resolution which was passed by the Iowa Chapter of the American Institute of Architects:—"Whereas certain architects have been considered as receiving remuneration for advertisements of contractors, supply houses, &c., on plan covers, specification covers, illustrated pamphlets of designs and the like, and whereas architects have been represented as favouring those who thus advertised and discriminating against those who did not, therefore it is to be in future the policy of the architects of the Iowa Chapter to refrain from all such advertising for supply houses, contractors, &c., which might be considered as influencing or bringing remuneration for such advertising to the architect or any person acting or pretending to act for him." There would be more of a chance of reform if, instead of leaving the duty to local chapters, the American Institute as a whole were to declare that the practice in question must be derogatory, and as likely to affect the general belief in the independence of architects in their relations with contractors.

MODERN judges seem eager to demonstrate that they are not to be restricted by their duties in Court, and that they are authorities on much else besides the precedents found in law reports. The Lord Justice Clerk of Scotland was to be heard on Monday reading a paper before the Royal Scottish Society of Arts on "Roads: what they are, and what they should be." In spite of all that is said about the general depression, there is no doubt the traffic on roads in this country has enormously developed. The result is that the wear and tear is so excessive it becomes quite evident that we must approach nearer to the old Roman system and impart substantiality to country roads. That means an increase in cost, which would be more than many districts could well pay. The Lord Justice Clerk agrees with those who consider it is desirable to establish a central authority by which a uniform construction would be obtained throughout the country, poor and wealthy districts being treated alike. The expense of main roads would accordingly fall on the Exchequer. In conclusion, it was said the commercial prosperity of the country would be increased if a sum of five or six millions sterling could be at once granted towards accomplishing improvements in roads.

ILLUSTRATIONS.

MOUNT STUART, ISLE OF BUTE, N.B.

WHENEVER the history of architecture in the nineteenth century is written at the length it merits, credit will be given to the late Marquis of BUTE for two of the most remarkable among examples of residences, viz. Cardiff Castle and the mansion of Mount Stuart, near Rothesay. The former was the only work in which the late WILLIAM BURGESS was allowed to demonstrate the possibilities of Mediævalism when the expenditure was generous. We have published several plates which are almost enough to suggest the building was a romance in costly and beautiful materials. From its position Cardiff Castle, or at least the great tower, can be seen by all who pass. But in his residence in the Isle of Bute the late Marquis was able to gratify that love of seclusion which was one of his characteristics. It is only from the sea that an uninterrupted view of the exterior can be seen. The commission was given to Sir R. ROWAND ANDERSON,

and a comparison of the illustrations which we are about to publish with those of Cardiff Castle will show that another type of Gothic was adopted, but one which was well adapted to suit all the purposes of a modern mansion.

PARLIAMENT CHAMBERS, GREAT SMITH STREET, WESTMINSTER.

THE building, of which the view shows the front elevation, is a block of over 100 offices in Great Smith Street, Westminster, adjoining the public library and opposite the Church House, erected for Mr. E. J. READ, of the London Banking Corporation, under the direction of Messrs. PALGRAVE & Co., architects, 28 Victoria Street, S.W. The elevations are carried out in pressed red bricks and buff terra-cotta from the Hatherly Station Terra-cotta Company in bold free detail. The building is fireproof throughout, and fitted with electric light and passenger-lift. The contractors are Messrs. WHITEHEAD & Co., of Clapham.

A STREET IN NUREMBERG.

ARRIVING at this interesting town by rail, says Mr. HAIG, the first street usually entered as you proceed from the station, which is situated outside the walls, is the Königstrasse, and you have not gone far before the subject of the accompanying illustration bursts upon the view. The towers in front are those of the ancient church of St. Lawrence, the house with the angle turrets to the left in the drawing is the so-called Nassauerhaus, and as for the other buildings making up the group, they are some of the ordinary burgher-houses of Nuremberg. The church of St. Lawrence was commenced in the year 1274, enlarged in 1403 and 1439, and finished in 1477, by THOMAS NORITZER, of Regensburg. It has undergone several restorations, the first in 1568 and the last in 1838, and now stands a rich and picturesque example of German Gothic. The most elaborate ornament of the exterior is the great western porch, rich in sculptured subjects, representing highest in the arch, God the Father on a throne, with CHRIST and MARY kneeling, and below, the Crucifixion, and in rows of smaller figures various events from the Old Testament and from the life of Our Lord. Remarkable also is the north porch, called the Bride Porch, and the great rose window over the west doorway; this window is 32 feet in diameter. The interior contains some fine old altars and altarpieces, excellent late painted glass in the great windows of the apse, but especially the famous Sacramenthaus, a magnificent Late Gothic structure, rising from the pavement, with its finial bending under the lofty vaulted ceiling. It is a masterpiece of the great Nuremberg sculptor, ADAM KRAFFT, who flourished in the latter half of the fifteenth century. The other building in the sketch next in importance to the church is the Nassauerhaus, which dates from the end of the fourteenth century. It was built for the patrician Nuremberg family of SCHLUSSELFELDER, whose coat-of-arms is to be found on some of the earlier shields adorning the building, and also in a later rococo insertion just under the oriel window. The name of Nassauerhaus has been given in honour of a prince of the House of Nassau, by whom the western portion of the church of St. Lawrence is said to have been erected. Opposite to this building, to the north of the church, is a good modern fountain by BURGSCHEIDT, surmounted by a statue of the German Emperor, ADOLPHUS OF NASSAU. The other buildings represented in the sketch need no separate description, as such structures are common in Nuremberg; the oriel windows and dormers shown are similar to many others, but slightly varied, to be found in nearly every street.

CATHEDRAL SERIES.—ST. ASAPH: INTERIOR, FROM WEST END.

THE illustration of the magistrates' offices, Southampton, in last number is only a design for the building, which is now being erected from the design of Mr. R. MACDONALD LUCAS.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. E. Guy Dawber, president, in the chair.

The following were elected as members:—Messrs. J. K. Round, S. A. Whitehead, R. M. Kelly, H. D. Ward and I. E. Bunce. Messrs. C. M. Shiner, Ellis Marsland, E. Fowler and C. S. Yates rejoined the Association.

On the motion of the President a vote of condolence was passed to the widow and relatives of the late Mr. T. Blashill. The deceased, said the President, was known to most of those present personally. He was one of the oldest members of the Association, and served as President in 1862. He had also many years ago organised a very successful trip to Italy. Mr. J. B. FULTON read a paper on

Byzantine Architecture.

It was one of the first-fruits of Christianity in architecture, spreading over Southern Europe, Palestine and Asia Minor.

It would indeed be an interesting study to trace the influence of early Roman building down to the Byzantine period. The influence is evident, as the architects must have visited Rome, and there studied the great temples and baths; but the Romans, with all their power of knowledge in construction and imagination in design, could never have built S. Sophia. Now, I wonder if we have realised that the nations down through the ages have built their greatest works to their God; here, in this new religion, we have everything carried to a greater height of excellence. Byzantine architecture was a revelation to the world, because it was not only building in the knowledge of beauty and truth, it was also the beginning of a higher and nobler power—soul-passion moulded in building. I could have written an elaborate treatise on the history of this style, but history is not particularly helpful in design, and anything which I say to-night must be for the furtherance of this great study. In sketching a building one ought, I think, to try and see design first, material, &c., afterwards; so in our thoughts and studies let us ever seek after food for our creative faculty in architectural design. I desire to show you some examples of Byzantine architecture—examples well-known but not one-half appreciated, as we do not fully realise the beauty and truth of construction in this style.

Constantinople.

S.S. Sergius and Bacchus.—Originally there were two churches; the existing one is a gem, and is in a wonderful state of preservation. The exterior shows domes resting on a great square base which, although bold in conception, is not very beautiful, but here little or nothing of the original detail is left. The dome is supported by eight piers, the arches forming an octagon, but below arches the angle sides of the octagon are semicircular recessed (and it is these recesses which give to the interior such a charm). The entablature of the first order shows a breaking away from classical tradition, although retaining architrave, frieze and cornice. This entablature gives strong horizontal lines, which are required because of the semicircular recesses, &c. The whole proportion of the lower storey is perfect, and impresses one very much. The delicate detail of capitals is worthy of special note, although they are now half buried in whitewash; note also the bold and ingenious way in which a combination of capital and entablature takes the round to the square on the upper columns. There are numerous churches of a later period in Constantinople, such as—

S. Theodore.—The outer narthex is comparatively large, and although the façade in itself is good, I think it unworthy of the best traditions of this style, as it is false to the plan. The church in plan is a Greek cross. The columns supporting dome seem rather weak.

S. Theodosia (now Gul-Jami).—The plan is an interesting one. The whole effect of the interior is achieved by form, as there is no detail.

Church of the Monastery of the Chora (now Kahriyeh Jami).—The façade of this church is thought to have served as a model for St. Mark's, Venice. The glory of this church is the decoration. There we see what the Byzantine architects were aiming after—true architecture, which means the unity of the three arts, revealing the character of the building. Constantinople is well worth a visit to see these mosaics alone, even although they have suffered by fire and earthquakes. I had the privilege of drawing the figure of St. George in the outer narthex, which is undoubtedly the finest study in mosaic that I have ever seen. With the exception of the head, hands and feet it is very excellent,

showing in its every line the true spirit of decorative design. I wish you to return to S.S. Sergius and Bacchus, and from there we will go direct to S. Sophia. We see in S.S. Sergius and Bacchus the germ; in S. Sophia the idea fully developed. This is one of the most talked-of buildings in the world, and if it is not it ought to be one of the most admired. You must all be familiar with the general conception of S. Sophia's great dome, half-domes, semicircular recesses, narthexes, aisles and great buttresses. The exterior is said to possess little architectural beauty. I think this impression is arrived at because of the stucco with which the original material is covered. I would suggest the taking away of the stucco, the minarets, buttresses and innumerable small Turkish buildings, which are out of harmony with the main building. Now look at the design with all these removed, see the great buttresses, the arch between, the semi-domes and great dome rising from the square base. Is it not a magnificent pile? The glory of the building is the interior. Here the three arts meet in perfect harmony (as they also met 500 years before in the capitals of the north portico of the Erechtheum in Athens). The passion and mystery is marvellous. No other building can compare with it in beauty, fine proportion and delicate detail. I have often wondered why a building such as this can only be built at a particular place and at a particular time or period in the world's history. I have sought to penetrate the secret thoughts of Anthemius and Isidorus, the architects who built this church. Besides having a knowledge of construction and design, their lives must have been virtuous, and wholly concentrated to their profession or art—to the glory of their God. As Ruskin and others have said somewhere, no matter what we do, even draw one line, and that line reveals our character. What a beautiful moral tone must have been reached before this church could have been built, as down to the minutest detail great excellence and refinement is shown. Let us think of this subject seriously, as this power we must possess before our national style can become worthy of the nation.

Palestine.

St. Mary's Church in Bethlehem is one of the earliest Byzantine churches known; in plan it consists of a nave and double aisle. The Golden Gate, Jerusalem, is in this style, but I came across nothing to call for special attention.

Asia Minor.

In Brusa we came across some interesting details, such as panels, capitals, &c., but nothing of special note.

Greece.

Athens has quite a number of Byzantine churches; all are comparatively small, although interesting. Byzantine churches are scattered all over Greece. I will mention but two, the Convent of Daphni, situate about five miles from Athens on the Sacred Way; in plan a Greek cross, and, although the construction is not quite so excellent as in the earlier Constantinople churches, it is nevertheless straightforward and good. The mosaics on a gold ground are in fine preservation—at least what are left. The figure of Christ is specially beautiful.

I also made a pilgrimage to St. Luke's, Stiris. This perhaps is one of the most interesting journeys that an architect can make in the quest of Byzantine churches. To visit the monastery and taste the hospitality of the monks is an experience in itself well worth having. Combine the love of fellow-men with the beauties of a vast and absolute quietness in the midst of great ranges of mountains, and you will have an idea of at least two of the attractions to this monastery in north Greece. The glory of the monastery is the church of St. Luke. The adjoining church to the Mother of God is not quite so interesting. The church of St. Luke's is almost perfect in its general design and decoration. Parts have fallen into disrepair, but, as a whole, it is still in a wonderful state of preservation. Messrs. Schultz and Barnsley deserve praise for bringing this gem of Byzantine art to England in book form. From my notes taken on the spot I find that what impressed me more than all else was the beauty of construction and lighting, which gave so great a mystery to the interior.

Italy.

In Italy Byzantine art reached a high state of perfection. The centres are Rome, Ravenna and Venice. The church of San Vitale at Ravenna shows direct influence from Constantinople. In plan a semicircular recess is formed from each side of an octagon except the side forming the chancel. The glory of Byzantine art in Italy is the church of St.

Mark's, Venice. In plan it is a Greek cross. A glance at the plan will reveal piers, &c., carrying domes forming aisles &c. The conception of the interior is a glorious one although to me it cannot compare with S. Sophia; it lacks the vastness and dignity, although in wealth of colour it has no equal. The lighting is well-nigh perfect, giving true value to form and colour. Ruskin uses such expressions as:—"The effects of St. Mark's depend not only upon the most delicate sculpture in every part, but as we have just stated, eminently on its colour also; and that the most subtle, variable, inexpressible colour in the world, the colour of glass, of transparent alabaster, of polished marble, of lustrous gold." These expressions give but an idea of beautiful material and fine workmanship; besides all these, there is a beauty which forms a mystery which lighting and atmosphere can only give. The façade is the finest example of an exterior in this art. The Gothic addition in the fifteenth century might have been better, and as regards fine architecture is not to be compared with the Byzantine building, with its pillared recesses, delicate sculptured detail and rich material; but, above all, the magnificent conception.

Domestic.—I have seen and know but little of Byzantine Domestic architecture. The Palace of Belisarius, Constantinople, is a magnificent example, and we had the pleasure of measuring it. This is what I would term a study, a decorative study, in stone and brick. There is a remarkable richness and wealth of material, and yet it is but the two commonest building materials we have. The decorative flat quality aimed after is very refined and suggestive. Some of the spandrels are specially good.

General Thoughts.—Byzantine art we must study if we truly desire our national thoughts to develop into a recognised style. See in this style true construction and excellent blending of the three arts.

A paper was also read by Mr. E. F. REYNOLDS ON

Byzantine Plan-forms.

The development of early Byzantine building is a subject of much interest and also of much difficulty. It is of interest because it formed an unbroken sequence in a period of disruption and change, linking the classical age of Greece and Rome with the Mediæval age of Christianised Europe, and also because it was so pregnant a source of future development. It is of difficulty because the influences which shaped its course were so complex, and because its builded record is now so broken and incomplete.

The founding of Constantinople is sometimes regarded as the starting-point of Byzantine art, but such arbitrary divisions are always misleading, if not altogether untrue. The removal of the capital from Rome to Constantinople doubtless exercised a very deep influence, and the energy of building which it called forth must have quickened architectural development, but it was strictly a development and no sudden change of style. It is historically certain that the new capital was intended by its founder to be a direct continuation of the traditions of the old capital. In the Edict of Dedication its title was "The New Rome"; the general design of the city followed the Roman model, with its forum, its circus, its basilicas, baths and porticoes, and its population was drawn from other cities of the Empire, and especially from Rome itself. And it is evident that this was inevitable, for Rome had so long and so completely impressed its type of civilisation throughout the Empire that no other form would have then seemed possible. Even after its removal of almost a thousand miles eastwards the capital was still surrounded by Roman influences.

Thus, both by intention and circumstance, Constantinople was essentially Roman in its foundation. But there were also many influences which in their working could not fail to modify this tradition and prevent a mere reproduction of Roman art. The most formative of these may perhaps be summed up as (1) the renewed ascendancy of the native Greek genius, (2) the more direct communication with Oriental influence, and (3) the unrestrained play of the forces of the Christian religion.

1. The removal of the capital placed it at the source of that Greek intellectual energy which had originally brought the Romans under artistic subjection. They had largely borrowed their decorative art from the Greeks, but an inverse process was now to take place, for while the Byzantines developed that system of constructive design which had formed the real vitality of Roman work, they modified and eventually discarded the unrelated decorative

design which had obscured the structural conception. Under the Romans a burden of over-developed and conventionally-applied detail had been accumulated serving to bestow a pompous magnificence on their buildings, but only remotely expressing their realities, and it was reserved for the lively Greek sense of right expression to translate the simple grandeur of Roman building into its decorative equivalent. Under Greek discrimination its vital principles were disengaged and purified, and decoration was once more brought into intimate relation with structural facts.

2. By the removal of the capital contact was also established with a more direct Oriental influence, for the position of Constantinople has always rendered it the centre of commercial exchange between East and West. The East has always been the natural home of the vault and the dome, and it is there that the origin of these methods of covering must be sought. At a later time, in the great dispersal of Mahommedan conquest from its Oriental centre, the dome was always carried as a characteristic of building, and even now, in Persia and elsewhere, the dome is the common unit of roofing. To this Eastern influence, which flowed to Constantinople along the great trade routes, may be attributed that freedom in the use of vault and dome which formed so integral a part of Byzantine building. The Byzantine method of vault construction was similar to the Oriental method, the courses being laid with inclined beds and independent of centring, while the Roman construction of ribs and shell was essentially different. This influence also filtered through Asia Minor, where a local school had already established itself, experimenting with new combinations of plan-form and arriving at the principle of the pendentive. Even the Imperial Roman buildings at Baalbec and Palmyra show something of the same tendency to break away from the academic style, in the substitution of the arch for the lintel, and in freshness of decoration. It seems as though this meeting-place of Greek and Oriental formed a kind of hot-bed which fostered the early growth of many forms which afterwards became typically Byzantine.

3. Christianity was recognised as the State religion only a short time before the foundation of the new capital, and it was at Constantinople that it found full force of expression. It brought a new inspiration to building, needing fresh forms specially adapted to its ritual, and a new mode of decoration explanatory and symbolical of its creed. The perfunctory worship and comparatively insignificant temples of the Roman mythology gave place to an ardent and enthusiastic religion which penetrated and revitalised all the arts. Roman art had in reality been almost purely secular, and its most characteristic monuments had been the fora, the theatres, the baths and, above all, the great works of engineering. But from the rise of Christianity religious building again assumed the lead, and although this is now unduly emphasised by the better preservation of such works, yet there can be no doubt that the prime energy of the Byzantines was devoted to their churches.

These, then, were, some of the main factors which determined the difference between Roman and Byzantine work. Following the new foundation, there was a period of 200 years growth and formation, a time of experiment with the new forces, and a gradual assimilation of the various elements—yet a period fruitful of splendid works, and culminating with the erection of S. Sophia. The precise course of development during this period can be only imperfectly known owing to the destruction of so many intermediate buildings. Constantinople has especially suffered from the violence of its earthquakes and the still greater violence of its riots, but phases which are missing there may sometimes be found in such affiliated centres as Ravenna and Salonica, while a comparison of the developed Byzantine forms with the embryo ideas of late Roman work often suggests the source from which that development sprang.

I propose, with your permission, to give some slight study to the plan-forms of S. Sophia, and to trace some of the earlier forms from which they seem to have been derived. If, in doing so, I traverse familiar ground, it will only be in order to give some sequence to the procession, and if I seem to have drawn to a large extent on recognised authorities, it is perhaps unavoidable in dealing with such a subject.

The uniqueness and originality of S. Sophia lies in the combination of two types of planning which hitherto have been developed more or less separately. These may be distinguished by the terms "basilican" and "radial," the basilican type being founded on a repetition of bays in

length, the radial type being founded on a repetition of bays around a common centre, producing circular or polygonal apses. The essential parts of the scheme of S. Sophia are (1) a central square bay, defined by four arches set on piers and covered with a dome on pendentives; and (2) two complex apses, applied to opposite sides of the central square and regulated by its arches. Of these two principal parts, the first may be traced to a basilican origin, and the second may be derived from the radial type of plan.

Basilican.

Turning attention first to the basilican type, the Romans had already solved the problem of the vaulted basilica, and the application of the intersecting barrel-vault to the great halls or tepidaria of their thermæ furnishes a series of such instances on a grand scale. The weight of the vaulting was gathered on to piers which divided the length of the hall into bays, and buttresses were projected behind them to absorb the thrust of the vault. The depth of these buttresses was included within the building, by an outer wall, and the chambers thus formed between them were opened to the main hall by archways, while they communicated with each other by openings through the bases of the buttresses. Lighting was obtained by a clerestory, which was allowed by the difference in height between the main hall and the subordinate chambers. Such was the usual construction of the tepidarium, and the well-known basilica, which was commenced by Maxentius and completed by Constantine, closely followed its model. Here, in all essentials, were the principles of so called "Gothic" construction—the grouping of the vaults on to recurrent points of support, the articulation of the walls into buttress-piers and enclosure, the consequent formation of aisles and the method of clerestory lighting.

Church-building of the basilican type largely followed the earlier and simpler construction of continuous colonnaded halls and timber roofs, such as is shown in S. Sabina at Rome, in S. Apollinare Nuovo at Ravenna, in S. Demetrius at Salonica and in the Euphrasian basilica at Parenzo. But, concurrently with these, the Byzantines also developed the application of the dome to the square compartment, and then extended it in continuous series to the basilican plan. The Romans had always applied the dome to circular or polygonal ground-plans, and only in the latter case was any transition of plan-form necessary. In the Baths of Caracalla there is an instance of an octagonal hall covered with a circular dome, and the transition is made by means of orbelling, in the form of a slight pendentive; but the full development of the pendentive was essentially Byzantine, and seems to have originated in the East rather than the West.

The spherical vault is intimately related to the dome set on pendentives, for the construction of its lower portion is, in fact, that of a pendentive, and the construction of its upper portion that of a dome, although there is no break in the continuity of surfaces. Such a form of vault is used in the Tomb of Galla Placidia at Ravenna, where it covers the intersecting square of a Greek cross plan, the arms of the cross being covered by barrel-vaults. The spherical vault, however, afforded no opportunity of admitting light, and in buildings of a larger scale this led to the raising of the upper part of the vault so as to form a separate dome, and eventually to the raising of the dome itself on a drum.

Plans in the form of a Greek cross naturally result from the use of a central square bay set on arches, the arms of the cross representing the depth of abutment necessary to those arches; and the generalised form of plan was of very early origin and of almost universal use. The Romans were familiar with it, and it is supposed that its Persian tradition was imported in the cruciform mosques of Cairo. This type of the Greek cross formed a most important chapter in the history of Byzantine planning, for with the application of the dome to the central square, the constructional meaning of the plan was extended to the vaulting, the barrel-vaults over the arms providing abutment to the thrust of the dome.

The plan of S. Sophia at Salonica shows a development of this type. The central cruciform is abutted by four compound piers, which fill its external angles and bring it to a square outline. The dome is raised on a low drum and set on pendentives, and the shallow arms of the cross are covered with barrel-vaults. This inner part of the structure is complete and self-sustaining, but three apses are added to the east, a narthex to the west and aisles to the north and south. These aisles are opened to the central area by arcades, and they are of two heights, the upper storey being the women's gallery.

The application of the dome to the square compartment being solved, the basilican plan could be covered by a series of such bays. The church of the Holy Apostles at Constantinople (now destroyed) showed this development. The plan consisted of five compartments arranged in the form of a cross, and each of these was practically a repetition of the central construction of S. Sophia at Salonica. There were the same compound piers, the same shallow arms covered with barrel-vaults, and above them rose the domes set on pendentives, the central dome being pierced with windows. But here the repetition of the bays shows the development of their shallow arms into continuous aisles, and the division is emphasised by the colonnades carrying the women's galleries. Thus these aisles arose from the construction of the square domed compartment, their width representing the depth of abutment necessary for its arches, and their barrel-vaults giving abutment to its dome. The plan is particularly interesting, not only because the Greek cross form of each bay is repeated in the general disposition, but also because it was the prototype of St. Mark's at Venice.

This church of the Holy Apostles is known to us only by description, but, if it seems too hypothetical an instance, the existing church of S. Irene at Constantinople may be quoted. It was a contemporary building, and its plan consists of two great bays covered with domes, the eastern dome being raised on a drum pierced with windows. On each side are narrow abutment-aisles, and colonnades carry the galleries over. The building has been complicated by various restorations and rebuildings, but in its main lines the design is attributed to the same period as S. Sophia at Constantinople.

The Byzantine builders had thus arrived at the domed basilica, and the central square of S. Sophia may be regarded as being founded on the bay design of such a basilica applied on a grand scale. The plan-form is still remarkably similar to that of its Roman prototype, as shown in the vaulted basilica of Constantine, for the main transverse arches are still abutted by deeply-projecting buttresses, the aisles are still formed by the enclosure of their projection, and communicate in the same way by openings through the bases of the buttresses, while the same method of clerestory lighting is preserved. But the substitution of the dome for the vault gave rise to the necessity of continuous abutment between the main piers, and this is expressed on the plan by the increased depth of the arches which sustain the dome. This depth appears on the ground-plan as a narrow aisle on each side of the main square, and these correspond to the abutment aisles of the smaller basilican churches already discussed. Outside these are the aisles proper, formed by the penetration of the great buttresses, and beyond these again are narrow abutment aisles which absorb the thrust of the vaulting over the aisles proper. Thus the aisle system of S. Sophia shows the complete basilican design in itself, the piers being represented by detached columns.

Turning now to the apses which form the second essential part of the scheme. The apse was a favourite feature with the Romans, and had been applied by them in a great variety of ways. It seems generally to have been regarded as a method of terminating a vista or a series of repeated bays, its curving line satisfactorily returning their horizontal lines. In this way it was introduced in the basilican plan as the termination of the colonnades forming the nave, and this treatment was repeated at both ends in the Basilica Ulpia at Rome. This opposition of hemispherical forms may be seen on a large scale in the designs of the Roman fora, and in the enclosures around the baths the same *motif* was often employed. In the baths themselves the apse was used with the greatest freedom, and in some instances it was applied to opposite sides of square, vaulted chambers, thus almost approaching the plan of S. Sophia in a very simplified form.

The origin of the apse in the Christian church was probably derived from the "triclina" of the private houses, which were the earliest meeting-places of the new sect, but the form and position of the church apse exactly corresponds with its use in the judicial basilicas, and the ceremonial significance of the latter may well have influenced its use in churches. The repetition of apses at each end of the nave was probably another instance of such parallel influence, for while Roman traditions were quite sufficient to give its origin, yet it often seems to have arisen from a change in orientation, first toward the west and subsequently to the east. However this may have been, it is clear that the opposed apses of S. Sophia were no new

invention, and their originality lay rather in the special form which they assumed. For they were of no such simple form as was employed by the Romans, but were of a highly developed and complex character, which was due to an entirely different source. This source was the Byzantine development of that Roman type of plan which I have mentioned as the "radial" type, and it will be necessary to briefly indicate the phases through which it passed.

(To be concluded.)

THE SCOTTISH ACADEMY AND NATIONAL GALLERY.

AT the annual banquet of the Royal Scottish Academy on Friday, Sir James Guthrie, the president, delivered an important address upon the proposals concerning the School of Art and the National Gallery. According to the *Scotsman*, the President said:—We have heard from time to time that the Academy is suspect in some quarters because it is an interested party. Well, we are interested. How can it be otherwise? We are the Royal Scottish Academy of Painting, Sculpture and Architecture, with the responsibility of fostering these arts, but without means of doing so. But surely we are neither beggars nor sorners, for we have indicated our willingness to give an equivalent for improved means of performing our functions, and the real gains of such a transaction would fall, not to us, but to those who ought to have them—to the people of Scotland—who would be richer by our annual exhibition of worthier scope than we can provide at present, and by the possession of a notable collection of works of art. That, briefly, is our position, so far as the Academy *per se* is concerned. There is, however, other and larger ground which we have taken and which we must keep. As Scotsmen and as artists we realise that School of Art, Academy and National Gallery are not separate entities, but are parts of a whole. The School of Art laying that foundation of craftsmanship on which the fabric of art must rest; the Royal Academy presenting year by year the work of our own day, and the National Gallery garnering the artistry of all time, are, in any adequate view of the question, essential members of one body. While it is true, however, that these three units are indispensable parts of a whole, there are two notable distinctions between the School of Art and the other two factors. First, from the point of view of its claims on Government, it must be noted that if the School of Art is to be dealt with as the schools of art in the other great cities of Scotland, it remains for the community of Edinburgh mainly to provide for its wants, since there seems no real reason why these should be borne by Government. No doubt the Scottish Education Department might be relied on to do its part in this work, and no doubt an equivalent for the present premises, which are wholly unsuitable, could with justice be asked from Government. Secondly, as to the housing of the school. When the representative work of the artist is in our hands, let us honour it, let us enshrine it worthily. This is the position of a national gallery which, for this and other reasons, demands a distinguished site. But in supplying the wants of the budding craftsman we are utilitarians pure and simple. Give him facilities and equipment for his daily labour. Preserve room for any special work, say on a great scale, that demands it. Let his school be fairly accessible and comfortable, and the needs are met. Such a place may be a simple series of sheds—more is not a necessity. Impressive sites, elaborate buildings and so forth are so much extravagance. It would appear, therefore, that efforts to combine the National Gallery and the School of Art must suffer from the attempt to make one site do duty for two institutions whose wants are radically different, and the problem seems difficult enough without this complication. Any man who takes an impartial view of the matter will see that our interest in all this movement is one that rises from the necessity of our existence, and I would ask you to believe that no man who calls himself an artist can fail to be loyal to the National Gallery. It is no question of expediency with him. It is a necessity of his nature. Hence the Academy may be suspect here or there, but you will look long at any scheme that we support ere you see in it treason to our own estate. Having summarised the recommendations of the departmental committee appointed by the Government, Sir James continued:—Now, are the people of Scotland to allow weighty recommendations from an authoritative and impartial body to be whittled down or lost sight of? I trust not. But if these are to be carried out, we must not allow them to be

smothered by suggestions, well meant no doubt, but for the most part irrelevant, puny and irresponsible. Here I find I ought to say beware of the objector. It is an easy matter to point out difficulties and disadvantages, but a wholesome method of testing the value of an objector is to find out what he proposes to do constructively. This analysis will sometimes be found an illuminating process. Many of you are aware that proposals which affect more or less the interests of other bodies in the city have been in the air. Surely it is needless for me to say that we wish no one to suffer that art may gain. But I would ask you if the matter cannot be lifted out of the region of vested interests altogether and faced on national lines as so grand an issue ought to be? Either Scotland has the right to a greatly enlarged National Gallery or she has not. If she has, it is a full right, and its measure, so far as Government responsibility goes, is the treatment given to the national galleries of the sister kingdoms. Make the basis of calculation what you will, and if she has this full right, surely she should be satisfied now, inconvenient as this year of grace or that may be. Let us not forget this, and not forget also that she can only get her due if her representatives stand stoutly for it in Parliament and stand together as Scotsmen.

What form is it to take? Is it to be small or great? I have said that the measure of Government assistance is the treatment given to the national galleries of the sister kingdoms; but there is another measure which may well come into play in determining the scope of such an institution. That is the interest taken in art by Scotsmen. It is not for me to recount to you what has been done by Scottish artists, but I am entitled to say that our country has sent out men who occupy the highest positions in England, and that she has kept men who have received the highest recognition abroad. The walls of these rooms bear witness to the fact. What of the appreciation of art by her laymen? Simply this—and I say it deliberately—that the great art movements of our own times have been most quickly and most warmly welcomed by Scotsmen. It is indisputable that the work of the romanticists of the nineteenth century—French and Dutch—was appreciated, written about and owned by Scotsmen, in and out of Scotland, long before it was seriously taken up across the border. Insignificant as our hereditary possessions are compared with those of England, the collections of our own day are in the highest degree noteworthy, for acquired work by the greatest artists of all time is held to-day by Scotsmen in Scotland to an extent by no means generally known. One could easily give examples. Well, if the National Gallery is to reflect the state of things, we are driven to the conclusion that it cannot be set on a small basis. But it may be said it is easy to propose high matters; the carrying-out is the difficulty. It is. Yet surely Scotsmen do not require to be reminded that it is the large spirit that makes the large place, and that it is the small spirit that makes the small one. If this matter is to be handled on a worthy scale, how is the money to be found? What are the assets? I can only throw out suggestions, and I do so with some diffidence. Well, there is a considerable sum of Scottish money in hand. (1) In the capital saved by the Board of Manufactures out of their scant provision in the past; (2) in the Scottish equivalent money, which might be capitalised. This would cost the Treasury nothing, and we may fairly add to it the responsibility pronounced by the departmental committee to rest upon Government. Further, we have the interest of the Town Council of this city, without whose aid the present National Gallery and Academy would not have been as they are to-day. I do not believe they will neglect institutions which they helped to bring into their present state of existence. When all these items are allowed for we shall probably still be short of the financial requirements. This brings us to a grave issue. But if you agree with me, you will say that it need not bring us to a full stop. Is it necessary that the whole undertaking must be a dead lift on the part of Government, the Town Council and the Academy? I cannot see it. Looking to the interest that Scotsmen have in art matters, I should be slow to conclude that a plan conceived in a national spirit would not be responded to by men able enough and generous enough to help. When we think of the splendid benefactions to our universities, of which we are so proud, and of the gifts that have been made by public-spirited men in the art region itself, it seems to me that our compatriots in Scotland, in England, aye, and beyond the seas, might well be given a chance to do this great thing for the art life of their country. But it is necessary to be concrete, and if a concrete plan were

formulated in which the available resources could be defined and the plain issue were left that such-and-such a sum would be required if this boon were to be secured to our nation, I cannot think that we should look in vain to the interest and goodwill of our countrymen. No one who is familiar with the growth of such collections can view the present position of the National Gallery without the keenest regret. Here is a national institution practically stopped in mid-career, placed in such a position that substantial growth has long been impossible, and that the interest of those who might lend, give or bequeath art treasures to it is repelled rather than attracted, so that the collection on view to-day, excellent as it is, does not represent what we might have had, what one feels convinced we should have had, if circumstances had allowed us free course. In spite of the most anxious care on the part of the curator, who is to be congratulated on the improvements he has made, and to be sympathised with in a position made unusually difficult by circumstances, there is not only no room for any addition to the present collection, but the contents of the Gallery cannot be seen to anything like advantage. I would ask you all if people are likely to give works of art to an institution in this condition? Picture, on the other hand, a set of galleries with their contents displayed to advantage in ample surroundings, with plenty of blank spaces for the noblest works of art, and with room to expand as the years add to the collection. Add to that the knowledge and the enthusiasm of Scotsmen. Can we doubt the result? Yet this is no fancy picture; it is a simple statement of what we might have, and it has fact to back it. Not merely the national galleries, but the municipal ones in the great cities of England and Scotland bear testimony to the fact that where good housing is provided the growth of a collection proceeds apace. While these galleries are gathering examples of the art of past ages, they are year by year forming collections of the work of our own day, and providing a stimulus of the highest value to modern art. What are we doing in this respect in this city that seems made to be a centre for art encouragement? Absolutely nothing. It is both a mending of our ways, then, that is called for and a broadening of them, and I would appeal to you, and through you, to the people of Scotland, irksome as the present position is, to give patient effort to a solution of this question on a scale worthy of your country, rather than to be tempted by opportunist proposals which may indeed help at the moment, but which will effectually block the way for the realisation of the aspirations that all Scotsmen who wish to see art have a firm footing here must cherish. I could wish to speak more definitely upon this matter, but as the question is now being considered in detail by the Academy, it would not be proper for me to press my personal views.

I can, however, assure you that we desire to bring forward something more than general opinions, and that we hope soon to produce definite suggestions for dealing with this matter, and in any such plans it must be borne in mind that if certain things are desirable in a National Gallery other things are necessities. But I may perhaps, without impropriety, state that in the view of the Academy committee a building, affording at least a half more accommodation than this one in its entirety, is required as a worthy initial home for a National Gallery, and that such a building would require to have possibilities of extension. It ought to be set on a commanding site, and I know of no city more able to provide this, nor do I see that it need be placed upon the most crowded thoroughfare. I should lean rather to a point that may be easily reached, but that is set apart from the daily bustle of the streets. The Calton Hill is spoken of as if it were out of the way, but I have never been able to see this. If it is out of the way what of St. Giles? What of the University? What of the M'Ewan Hall? The truth is this city, so spacious and impressive in its setting, is yet on such a scale that there is no such thing as distance between its salient points. If the Calton Hill were enriched with appropriate buildings, I can see nothing to prevent it from being the Acropolis which an earlier generation, to whom the city owes so much of its beauty and dignity, plainly intended it to be. Nor can I see why it should not be a resort of peculiar value for inhabitants permanent and temporary.

Mr. Frank Rutter will give a lecture on "Impressionism." in the Grafton Galleries on Sunday next, the 5th inst. **Mr. John Lavery, R.S.A.**, will preside. The proceeds of the lecture will go towards the purchase for the nation of a work by one of the French Impressionists.

THE SINAI EXPEDITION.

IN his explorations Professor Flinders Petrie has been hitherto unusually successful. He can therefore afford to be philosophic over his disappointment at Sinai, especially as he must be confident the public will sympathise with him. The Professor gives the following account of his attempt in the *Times* :—

In considering the available sources for the early history of Egypt, Sinai seemed to be the most promising of them. Abydos had already yielded the story of the first dynasty, and some reigns before and after that. Saggara, which contains the second and third dynasties, is closed to scientific research at present. And the only other site for such early monuments was Sinai. The Egypt Exploration Committee therefore agreed to my proposal to completely record the remains there. A great aid to such work was that Captain Weill had just issued a corpus of all that was yet known, so that the list of sculptures and the existing copies were all before us. Half a dozen serious workers had all been in the field, but none of them had made facsimile full-sized copies. There were sketches, small-scale photographs and paper impressions which were often defective; but there was no adequate representation of the art, no complete publication and no plan of the monuments. Fortunately, Captain Weill has joined our party, and brought his knowledge of all the known material.

To our dismay we found that the mining company which tried in 1901 to work for turquoises at Maghara, without commercial success, had destroyed the larger part of the ancient sculptures, and the destruction is still continued by the natives. No restrictions seem to have been made by the Government; yet the wrecked sculptures are what no one would have been allowed to remove in safety to Europe as antiquities. Out of forty-one inscriptions only eleven remain in good condition, six more are injured and twenty-four have entirely vanished. The sale value to museums of what the miners have destroyed is worth more than probably all the turquoises they got. It is earnestly to be hoped that, if the Egyptian Government does not remove the remaining sculptures at once from the present mining, there will at least be no objection made to some museum saving what is still left here. Financial greed has destroyed a large part of the monuments of Egypt in the past century, and is yet going to destroy them rapidly.

The greatest gap in our knowledge of the history of civilisation in Egypt was in the period of the second and third dynasties. Even in the dark times of the tenth or sixteenth dynasties we at least know the general course; but what came between the two great periods of the first and fourth dynasties was yet unknown. Was there merely a slackening of art under the same people, or was there a political and artistic fall, and a new development by the Pyramid builders? This point, which we most needed to clear up, has been happily illustrated by a sculpture which I found representing King Sanekht, the first of the third dynasty. It had been twice seen by travellers, but never understood, described or copied. This figure shows Sanekht as a complete Sudani, of the dark yellow-brown type of modern times, with a fleshy, long hooked nose and very thick lips. His expression is truculent and brutal, and is much more markedly Ethiopian than even the Ethiopian kings of the twenty-fifth dynasty. The work is excellent; but the sculpture of his successor Zeser is the rudest of all known here. We are thus led to see an Ethiopian invasion as the cause of the overthrow of the second dynasty, and a fall of art as the result of that, out of which a new style arose by the close of the third dynasty, which brought in the glorious age of the Pyramid builders. One more great wave is shown to have occurred in the civilisation of the land.

It has been in doubt whether turquoise or copper was the object of the Egyptian miners at Maghara. From the ruins of their houses it is clear that copper was smelted here in the fourth and twelfth dynasties; but we cannot find any traces of it in the mines, which, in the few that remain unspoiled, seem certainly to follow the veins of turquoise. The ancient rubbish heaps of the mines also yield a large quantity of turquoise chips. So it seems that both materials were sought at Maghara.

There are three methods in the ancient mining. The third and twelfth dynasty mines were worked entirely by the chisel. In another period (which we cannot date owing to the destruction of inscriptions) holes were picked in the rock, about 5 inches across and a foot deep, and blocks were thus broken away. In none of the rubbish of these

mines are any flints found. But another class of heaps contains many flints, which were used for working in the sandstone, and these probably were the Bedawi waste of all periods, perhaps even prehistoric.

We have now copied in full-size facsimile and photographed all the inscriptions and sculptures which remain at Maghara. But our paper moulds have been delayed owing to the theft of a half-hundredweight roll of paper by the natives, and long delays in getting more from Cairo. The historical result is one of the most valuable that could be obtained, and well repays a month spent at Maghara. Our party is already in course of moving over to the other mining centre of Sarabit el Khadem.

DEVELOPMENT OF ART.

AN address was delivered by the Hon. and Rev. J. C. Adderley at the distribution of prizes to the Saltley branch of the Birmingham Municipal School of Art. He said there could be nothing more important for the development of art than the progress and success of municipal schools, and the Birmingham school, he was convinced, had more than justified its foundation. One result of the progress of art in Birmingham, and in a large measure due to the municipal school, was that no one now associated the name of Birmingham with shoddy and sham work. On the contrary, the name of Birmingham to any enlightened person now suggested real art and real beauty in design. The only practical acquaintance he had with the Birmingham School of Art had been as editor of a parish magazine, and his experience led him to value its work very much. He pointed out the opportunities which presented themselves for effecting an improvement in the artistic design and work of covers for books, and especially magazines, just as an improvement had been effected in many of the pictorial advertisements to be seen at the railway-station bookstalls and in other places. Some of the advertisements, instead of being terrible shocks to the observer, disclosed first-rate work and real pictures which it was a pleasure to look upon. That meant that we had artists among us, and that the taste of the public was improving. It meant that we had got beyond the stage of thinking there was a great gulf fixed between the ornamental and useful. Nature was the great exhibition of the eternal combination of the useful and ornamental. Instead of building colossal co-operative stores to supply mankind with food, nature gave us our food by means of ravishing cornfields, beautiful water-springs and gardens. Everything was useful in nature and beautiful at the same time. The artist copied nature in that by trying to make useful things beautiful. Among the artistic nations like Italy one never saw an ugly thing. The lamp-posts, warehouses, bridges, wine bottles and even slop pails were all beautiful, and he often wondered whether we should get the same artistic work in England. A great change for the better had taken place of late years in regard to the erection of buildings, especially in London, but one could still wish that the Council schools were built with more taste. In Birmingham they had done much better than in London, but even here there was still room for improvement. Everything depended upon the cultivation of taste among the people. In the Middle Ages, and, indeed, not so long before the days of machinery, there were real artists everywhere in England, and the cathedrals and old buildings were illustrations of the beautiful work which was accomplished by the artists in the past. Good work could not be obtained without hard work, whether it was in originality of design or in execution, and a busy school of art was a great object-lesson to all people. The establishment of municipal schools of art influenced the whole people, educating them to appreciate things which were beautiful in form and colour, and stimulating them to acquire that which was artistic. The public taste grew in proportion as beautiful things became common objects, and if we were not all great artists we could co-operate in the work of making the homes and the surroundings of the poor as pleasant as possible instead of permitting the continuance of the slums and miserable dwellings which caused so much sadness among all thoughtful people. He paid a tribute to Mr. Cadbury for the successful way in which he, almost alone among employers, had brought happiness and joy to so many of his employes, and urged that public bodies might do many things to help the common weal. He would like to see more attention paid to the election of men who possessed real taste. We must have business men, but on the public bodies men were required who had some real

artistic feeling. It was simply criminal that the making of streets should be so largely in the hands of men who had no idea of art at all. He had been a member of the housing and improvement committee of one of the London borough councils, and he had often felt ashamed of the way in which the municipality disregarded things of beauty in the making of streets. Principal schools of art might do something to teach municipalities. The clergy were also neglectful of art. They had tremendous opportunities of spreading good art by means of their churches, but they did not avail themselves of them. In the churches, and especially the old churches, they had ready to hand great homes of art. In the restoration of churches they had great responsibilities, and he might say the same in regard to the decoration of them, and he wished the clergy would pay more attention to that which was artistic. The social reformers, statesmen, clergymen and business men all needed the companionship of the artist.

MEDIÆVAL LIBRARIES.

A LECTURE was delivered lately in Wimbledon before the Arts and Crafts Guild by Mr. T. G. Jackson, R.A., on "Mediæval Libraries." He pointed out that when books were rare and precious it was natural that they should have been very carefully stored away, and that the strictest provision should have been made for their use. Private libraries could hardly have existed during the earlier centuries. Though most educated persons probably possessed a few books, the only large collections must have been those in connection with the religious houses or colleges, and, a little later, in the Universities. The earliest of these conventual libraries go back to the time of St. Benedict, of the sixth century, who made reading at stated times a part of his rules. But there were libraries in the churches before his time. At Jerusalem there was one in the third century, and the church at Hippo inherited the books of St. Augustine. This takes us back to the time when the great Roman libraries were still in existence, and when the great Alexandrian library still had its 400,000 volumes, in spite of the disastrous fire which had destroyed so many during the siege by Julius Cæsar. Private libraries of the Romans were of two kinds. The simpler plan was to store the books in a press, when the volume sought would be taken away to be read elsewhere. One of the chambers discovered at Herculaneum in 1752 was a library. It was a small room, the sides of which one could touch by spreading out one's arms, but in it over 1,750 papyrus volumes were found, arranged in presses round the walls. These cases (*armaria*) were about a man's height, and had been numbered. But the wealthy man among the Romans was not satisfied with this modest way of dealing with his books. He placed them on shelves in an elegant furnished room, and decorated the presses with busts or pictures and inscriptions below, and sometimes covered the woodwork with precious inlays. It became fashionable to have a library, and then many men to be in the fashion had their thousands of volumes, of which they never opened one. Seneca laughs at the man who set up bookcases of cedar and ivory, and collected volumes of unknown or worthless authors, and yawns in the midst of his books, of which he knows no more than the titles. "At the houses of the idlest of mankind," he says, "you will find all the orators and historians, and bookcases piled up to the ceiling; for a library has to be furnished out nowadays by the side of the bath as a necessary ornament of the house. Did this come as a love of study, it might be pardoned, but now these exquisite works of sacred genius are collected and adorned with their portraits as mere wall decorations." Luxurious libraries were not found in the Middle Ages among the churches and convents. A very modest provision was necessary for the few readers and perhaps still fewer books of those dark days. For the most part the books were kept in chests or locked in presses which retained the old Roman name, *armaria*. As the number of volumes increased, those to be used for reference were placed along the cloisters, while those for more serious study were lent out to the monks to read. In the Cistercian House, a small room was provided without a window for storing the books. At Christ Church, Canterbury, the number of books at the beginning of the fourth century had risen to 698, which were disposed in cases in various parts of the convent wherever space could be found. A library was built over one of the chapels at Canterbury near the middle of the fifteenth century, and about the

same time Prior Wessington placed one over the old sanctuary at Durham. The oldest structure was that at Oxford, which, though adapted to other means in later times, still retains many of its original features. On the north side of the choir of St. Mary's Church is a two-storeyed building adjoining the tower. This structure, rarely seen by visitors, is the most historical spot in the University. In the lower room the congregation of the University used to meet for some 200 years, and in the upper room were arranged the books of the University library, which has grown to be one of the greatest in the world. In 1333-45, Bishop de Bury of Durham lamented the shameful neglect of books by people of his day in the following parable, in which he makes the books say:—"In the first place we are expelled from the homes of the clergy, appropriated to us by hereditary rights, to some interior chamber, or are banished to suffer opprobrium out of doors; our places, moreover, are occupied by hounds and hawks, and sometimes by a biped beast—woman to wit—whose company was formerly shunned by the clergy, from whom we have ever taught our pupils to fly more than from the asp; wherefor this beast, ever jealous of our studies, and at all times incapable, spying us at last in a corner, protected only by the web of some long deceased spider, laughed us to scorn." The lecturer gave details of the methods adopted to chain books to prevent theft, and showed specimens of the pieces of iron-work formerly used. The lecture was illustrated by views of some of the celebrated libraries at the universities and the great public schools.

LIVERPOOL CATHEDRAL.

ON Tuesday a meeting of the general committee was held in the council chamber of the town hall. The Lord Mayor presided. Mr. F. M. Radcliffe, hon. treasurer, submitted a statement showing that the amount of contributions and promises to date on the general account was 197,901*l.* This included seven sums of 10,000*l.* each, one of 5,000*l.*, one of 4,000*l.*, six of 2,000*l.* each, forty-four of 1,000*l.* and upwards, thirty-three of 500*l.* and upwards, and 243 of 100*l.* and upwards. The contributions for special purposes:—Mrs. Barrow for an organ, 10,000*l.*; Mr. Sutton Timmis for a window, 2,020*l.*; the family of the late Mr. W. E. Gladstone for a purpose yet to be ascertained, 1,120*l.*; the Gladstone Memorial committee, 626*l.*; Mrs. Killick and the Misses Schofield for a pulpit, 2,014*l.*; Mrs. Gilmour for a window, 1,014*l.*; Miss Branker for a font, 1,017*l.*; Mrs. G. W. Moss for communion rails, 400*l.*; Miss L. E. Ashton-Rigby for a window, 300*l.*; and Miss Westgarth for a window, 80*l.*; amounting altogether to 18,594*l.* The interest on the investments and bank interest amounted to 8,787*l.* 14*s.* 7*d.*, bringing the total of contributions and promises for general purposes, special purposes and interest to 225,283*l.* 17*s.* 7*d.* Since 1903 they had had an increase in the general donations of 62,429*l.*, and special donations of 17,794*l.*, or 80,223*l.* in all. That was irrespective of one or two special gifts, including the gift of the Earle and Langton families, which, though it was not included in the present balance-sheet, had been handed to him in cash or investments by Sir Arthur Earle since the beginning of the year. If that were added to the other amounts referred to, it would bring the total increase up to 105,237*l.* That was also irrespective of such promises as the Ismay window, the Lathom chapter-house, &c. On the other side of the account, they had spent on the building site 19,294*l.*; the expenses of the promotion of the Parliamentary Bills of 1885 and 1902, 3,885*l.*; honorarium for designs and fees to architects, 5,065*l.*; excavations and foundations, 2,500*l.*; clerk of work's salary and expenses, 311*l.*; the foundation-stone ceremony cost in the erection of stands, printing, advertising, &c., 4,187*l.*, less 3,483*l.* received by the sale of tickets, leaving as the net cost of that ceremony 703*l.* 19*s.* 5*d.* The general expenses, including salaries, printing, advertising expenses, stationery, &c., were in 1901 451*l.*, 1902 725*l.*, 1903 703*l.* and 1904 1,126*l.*, making a total of 3,007*l.* The total sum they had now available for the main building was 146,918*l.*, and as the architects' estimate was 277,000*l.*, it would be seen that the committee required another 130,000*l.*

Lord Derby, in moving the adoption of the financial statement, said that when they remembered it was less than five years since they started on that work, and when they looked back on what they had been enabled to do, it inspired them not only to complete that work so far as they were able, but to hope that those who came after would do

their share in a like manner. Even the most sanguine and the youngest of them did not enter on that work with the hope that it would be completed in the lifetime of one generation. In many ways it was almost better it should not be so, because they hoped this cathedral would be an abiding record of the desire of churchmen of succeeding generations to erect within the diocese of Liverpool a cathedral worthy of its great object. The history of the successful cathedrals of the country showed that the most beautiful, where every detail was carried out with the most scrupulous reverence, were those which had been the work of many generations. There certainly was at present no room for despondency, and he hoped there never would be.

The Bishop of Liverpool heartily thanked the subscribers who in less than five years had contributed so magnificent a sum for the building of the cathedral. That sum was not drawn from one class of the community, but from every class. He was devoutly thankful that the cathedral would go down to future generations linked with some of the great and noble names for which Liverpool was famous. He would also like to thank the committee, who included some of their leading citizens, whose knowledge of the locality and its peoples, their means and needs, made the movement the success it was. One object they had in view was that the cathedral should be built not for the city of Liverpool, but for the diocese; not for one school of thought, but for the whole of the Church of England; not for one class in the community, but for the people. It had been their desire from the first that it should be a people's cathedral and built by the people themselves. Lastly, he wished to thank the diocese that, in spite of the very heavy drain upon its resources, it had not justified the prophecy that the building of the cathedral would kill churchbuilding in the diocese. So far from doing that, it had stimulated it. Last year three new churches were built. In the present year four churches were waiting to be opened, and they hoped before many months to lay the foundations of two churches more.

Sir William Forwood moved that the Earl of Lathom, the Rev. Canon Sylvester, the Rev. J. A. Kempthorne, Mr. Sutton Timmis and Mr. A. G. Lyster should be elected members of the executive committee, with Canon Sylvester as hon. secretary in the place of Canon Willink, resigned. He thought they ought to hasten on with the completion of the first portion of the cathedral, because until that was done they would not be able to hold Divine service or endow the chapter of the cathedral. The first portion of the cathedral might be finished within ten years, and would cost some 270,000*l.* As they only wanted 130,000*l.* to complete that sum, he felt the present generation might at all events hope to see that not only carried out, but Divine service held in the first portion of the building.

Mr. G. H. Ball said he made the suggestion some time ago that people who subscribed a thousand pounds or upwards should have their names inscribed in some way in the cathedral. That idea had been carried out at a new cathedral in Paris which was erected in twenty years. If the same thing were done in this district they would probably get a greater response than hitherto.

The Chairman said that suggestion would be considered.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on the 26th ult., Mr. Thos. H. Mawson read a paper on "The Principles and Practice of Garden-Making." Mr. G. B. Bulmer, president, was in the chair.

The Lecturer said:—Although I have no wish to pose as an architect, yet I am deeply interested in all subjects that appertain to the house and garden, and also in the furnishing of the home. Candidly speaking, we all know how impossible it is for an architect to master technically the vast range of ever-increasing subjects that crowd into an ordinary town practice, and I find the same in my own subdivision of the profession, if I may so call it. Most part of our small gardens seem to lack just the one touch of regularity which is in accord with the house—in most cases a compact low hedge or a breadth of grass—touches which an architect should be able from the nature of his training to impart, for when once the gardener is started upon right lines he can maintain it, but the ambitions of the modern gardener are too much centred upon and too much measured by his abilities to compete in the flower-show exhibitions. After having enunciated guiding principles, I desire to lay special stress upon one very important branch of the subject of

laying-out grounds, viz. the trees and plantations, the most important essential in imparting character and local colour to the environment of a home. At no time, if the scheme is to be successful, can we divorce the house and, in the strict force of the word, the gardens from the surroundings; all must be viewed together in unity. When there is perfect freedom of choice, the three great considerations in deciding upon the site and position of the house are—climatic conditions, that is, whether the pervading character of the air is humid or dry; the nature of the subsoil, whether sandy, gravelly or clay; and the aspect, for no matter what the prospects offer, it is unwise to build upon the north, north-west or north-east side of a hill or knoll. The nature of the subsoil is a point which needs more than ordinary caution. Beds of clay, though perhaps not so unhealthy, are cold and disagreeable and difficult to drain by the natural process of filtration. For healthy beauty, luxuriance and ultimate cheapness select a site with understratum of gravel or marl, and a good surface covering of loam. With regard to surface soil for a flower bed, it is a good plan to lay at a depth of about 2 feet a layer of broken bricks, then to overlay this with a covering of ashes, and then about 21 inches of soil of desirable lightness. For trees and shrubs a depth of 1 foot 6 inches or 2 feet, with a plentiful admixture of fibrous turf loam. Grass also requires a depth of soil not less than 8 inches, with a well-drained bottom properly prepared. With the intent of showing the successive stages of the development of a scheme, and the way it gradually assumes shape, the lecturer showed on the screen three schemes with plans and photographs. In each case the lecturer was the designer of the gardens, but as should always be the case, there was a free exchange of ideas and criticisms between the architect, client and the lecturer. The first scheme was in Ashdown Forest, the second on Beckhampstead Common and the third in Devonshire.

GENERAL.

The Death was announced, at Rome on the 30th ult., of Herr Hermann Corrodi, the landscape painter. He was born at Frascati in July, 1844. Hermann Corrodi travelled in the East, and the subjects of many of his pictures were Oriental and Italian landscapes. Some paintings of Cyprus were made for King Edward when he was Prince of Wales, and another buyer of his pictures was the German Emperor.

Mr. James Robert Mosse, C.E., Tunbridge Wells, whose will has been proved at 44,977*l.*, left his professional works to King's College, Nova Scotia, and a contingent reversionary interest in a trust fund of 25,000*l.* to the benevolent fund of the Institution of Civil Engineers.

The Edinburgh Town Council have been recommended by a special sub-committee that they should consent to their interest in the site on the Calton Hill being granted free for the proposed new National Gallery.

Mr. Louis Roullion, professor of manual training at the Teachers' College, Columbia University, has been appointed Chief Inspector of Technical Education for Ireland.

A Sub-Committee of the Edinburgh Council have considered a motion as to preparing a register of all the old buildings in Edinburgh of historical or architectural interest, and consider whether any steps should be taken for the preservation of those considered of sufficient importance to be retained or restored. It was remitted to the town clerk and Bailie Dobie to prepare a report containing a list of such houses, with details of their measurements, historical account, &c., and the cost of carrying out the register.

The Duke of Argyll in an appeal for the upkeep of Dunstaffnage Castle, near Oban, says:—"It is desired to do for this place (where the Coronation Stone was treasured for centuries) what has been done for Carisbrooke, Isle of Wight, where the walls have been repaired and a museum formed to interest visitors."

The Art and Exhibitions Sub-Committee of the Liverpool Corporation have appointed as a deputation to visit the artists' studios in London in the interests of the next autumn exhibition the Lord Mayor, Alderman Sir W. B. Forwood, Councillor R. D. Holt, Colonel William Hall Walker, M.P., and the curator.

Mr. T. E. Knightley informs us that the late Mr. T. Blashill entered his office when he first came to London. He was introduced by Mr. Penfold, and remained with Mr. Knightley three years, for which he was certified when he was a candidate for the office of superintending architect for the late Metropolitan Board of Works.

A Programme has been prepared of the International Congress of Architects which will be held in London from July 16 to July 21, 1906. The committee of patronage will be constituted as follows:—Patron.—His Majesty the King. Hon. President.—The Prince of Wales. Committee of Patronage for Great Britain.—Honorary Vice-Presidents.—The Duke of Connaught, the Maharaja of Jaipur, the Archbishop of Canterbury, the Archbishop of York, the Duke of Devonshire, the Secretary of State for Foreign Affairs, the Marquis of Ripon, the Viceroy of India, Lord Windsor, Lord Esher, Lord Balcarras, M.P., Sir Edward Poynter, P.R.A., Sir Laurence Alma-Tadema, R.A.

The Annual General Meeting of the Royal Society of Antiquaries of Ireland was held on Tuesday. The president, Mr. John Ribton Garstin, was chairman.

The Leysian Mission and Settlement in City Road, London, was opened on the 27th ult. The Queen Victoria Hall has seating accommodation for 2,000 people. There are besides numerous classrooms, club-rooms, refreshment-rooms, gymnasium, &c. The cost has been 110,000*l.* A description, with double-page illustration of the building, appeared in our issue for August 5. The architects were Messrs. Bradshaw & Gass, and the contractors Messrs. Holliday & Greenwood.

The Belfast Art Society passed two resolutions at their recent annual meeting, one expressing the opinion that it was desirable that at least a portion of the collection of pictures recently exhibited at the Royal Hibernian Academy should be obtained for exhibition in Belfast, and the other affirming the desirability of providing a municipal art gallery worthy of the city.

Mr. Walton Aston, architect, of Manchester, has died at the early age of forty-four, and is much regretted. He contributed several papers to the Lancashire and Cheshire Antiquarian Society.

The Royal Cambrian Academy of Art at their annual meeting on Saturday decided to open the next exhibition on June 12, closing on September 30. Receiving day was fixed for May 12, varnishing day June 6, Press day June 7, and the private view day June 10. Mr. H. Clarence Whaite was re-elected president, Mr. Cuthbert C. Grundy vice-president.

A Collection of fine old carved and other frames, the property of Messrs. Lawrie & Co., who have dissolved partnership, was sold by auction on Monday. Among those sold were several specimens of sixteenth and seventeenth-century workmanship. A frame carved in wood with scrollwork and panels of trellis ornament, 56 inches by 43 inches, made 86*l.* 2*s.*; one of wood, architectural in design, with swags of fruits and cherubs' heads, early seventeenth century, 44 inches by 37 inches, 66*l.* 3*s.*; another of wood, scrollwork and other ornament, 66 inches by 52 inches, 33*l.* 12*s.*; a fourth, in wood, carved with various flowers in high relief, 71 inches by 57 inches, 35*l.* 14*s.*; a fifth, carved in wood, 55 inches by 39 inches, 32*l.*; and eight other frames realised an average of fully 20*l.* each.

The Death is announced of Mr. W. Fulton Brown, R.S.W., who was a regular contributor to the Edinburgh and Glasgow exhibitions for several years. His works were marked by skill in the interpretation of character and a keen appreciation of the requirements of harmony and composition in the treatment of figure in relation to landscape.

The Edinburgh Architectural Association will revive on Saturday, the 18th, the annual dinner. In the course of the evening a testimonial will be presented to Mr. William H. Page in recognition of his services as hon. secretary during the past four years. The subscription is limited to 5*s.* per member.

Count Plunkett gave a lecture recently in the Dublin Museum of Science and Art on the memorial to the Emperor Maximilian erected in the Hof Kirche at Innsbruck, in which he argued that Vischer's so-called "King Arthur" among the statues flanking the cenotaph really represented the Prince Arthur of Wales (elder brother of Henry VIII.) who was brother-in-law of Maximilian's son, Philip I. of Castile.

The Municipal Council of Fontainebleau intend to erect a theatre, for which designs in competition are to be sent in on or before May 1.

The Plans prepared by Mr. John A. Campbell, Glasgow, for the Queen Victoria memorial school for the sons of Scottish sailors and soldiers have been adopted. The buildings will be erected about two miles north of Stirling and are estimated to cost 45,000*l.*

The Architect.

THE WEEK.

THE committee of the Edinburgh Town Council who have charge of the business relating to the proposed Fisher Hall, which is to be erected in Edinburgh, have at last resolved to invite Sir ASTON WEBB and Dr. COWEN, the composer, to report upon the plans, especially with a view to the acoustic properties of the structure. It will be remembered that the plans were prepared by the city architect. Afterwards it was found necessary to modify them. Some members of the Council and citizens of Edinburgh believe that still further changes are necessary. Some time ago tenders were received for the erection of the building, and an appeal was made to have the work undertaken in order to provide employment for many people. But further deliberations were declared to be requisite. Many changes have been suggested, and it is not impossible that others will be recommended. The history of the building is remarkable, and suggests that Scottish caution may sometimes be carried to an undue extent.

PUBLIC bodies have become aware of the number of architects who have to struggle for a commission, and they are endeavouring in consequence to take advantage of the situation by insisting on a reduction of fees. One of the latest cases has occurred in Wycombe. A girls' school is to be erected. It was proposed to invite architects who would accept the work at 6 per cent., including quantities. In the course of a week the commission was reduced to 5½ per cent., but the Council having been informed that important buildings have been erected for 3 per cent., a still lower percentage will be offered as a bait. The cost of the building is not expected to exceed 4,000*l.* It is remarkable that a few years ago, when the town hall was erected, the Council paid the usual 5 per cent. to the architect and 2½ per cent. for the quantities. But since then the number of architects has increased in a ratio beyond the number of commissions. The conditions of professional life are becoming altered. But because a few architects are not affected nothing is done to prevent the increase of an evil which is bound to produce injurious effects on the art and practice of architecture in general.

THE Wallasey Urban District Council have received ninety-six competitive designs for their proposed new public offices to be erected on the "North Meade" site in Brighton Street, Seacombe. Sir WILLIAM EMERSON, the assessor appointed by the Council upon the nomination of the President of the Royal Institute of British Architects, has made his award in the following order, viz. :—(1) MESSRS. BRIGGS & WOLSTENHOLME and Mr. ARNOLD THORNELY, 51 North John Street, Liverpool; (2) Mr. A. H. JEMMETT and Mr. G. T. MCCOMBIE, 11 Little College Street, Westminster, London; (3) Mr. W. H. ASHFORD, of MESSRS. ASHFORD & GLADDING, 90 New Street, Birmingham. The premium for the first selected design is 200*l.*, for the second, 75*l.*, and for the third, 50*l.*

ANOTHER case which exemplified the position of an architect as arbitrator and that the latter office was not affected by his ceasing to hold the former came before Mr. Justice WARRINGTON on Monday. A contract had been entered into between Mr. CROSSLEY, a builder, and Mr. NYE, a building owner of Brighton. The architect was Mr. G. M. G. JAY. At the end of 1903 he was dismissed and Mr. PUTTICK was substituted. The builder took orders from Mr. PUTTICK, but when a dispute arose Mr. CROSSLEY acted according to the contract deed and referred matters to Mr. JAY's arbitration. Mr. NYE sought an injunction to restrain Mr. JAY from

acting as arbitrator and Mr. CROSSLEY from submitting the case to him. Mr. Justice WARRINGTON decided that Mr. JAY was the arbitrator recognised by the contract deed, and there was no obligation on the builder's part to accept any other, although Mr. PUTTICK was in the position of architect. His Lordship considered that the supposition of bias against Mr. NYE on the part of Mr. JAY was groundless. The plaintiff, therefore, having failed will have to pay all the costs.

THE dissatisfaction which arose in Paris when ERNEST BARRIAS produced his memorial of VICTOR HUGO caused his fickle countrymen to forget the admirable works which had been already achieved by the sculptor. For a time at least VICTOR HUGO was supposed to be the greatest of all literary men, and it was imagined that the sculptor should have indicated not only the poet, but the dramatist, the writer of romances, the patriot and the exile. The work of BARRIAS was not suggestive of so many occupations, and was therefore condemned. Such pathos as is seen in *The First Funeral*, in which ADAM is carrying the body of ABEL, while EVE laments her son, is rarely attempted, and the three figures are marvels of modelling. *The Young Mozart* is one of the favourite figures in the Luxembourg Gallery, while the *Bernard Palissy*, although in a most unsuitable position, is one of the most successful of single figures in Paris. There is a repose in the works of BARRIAS which could hardly be appreciated in so nervous an age as the present. He was the son of a painter on porcelain. In 1865 he won the Prix de Rome, and his first work in the Salon gained him repute. France has many able sculptors, but the place of ERNEST BARRIAS will not be easily filled.

ALTHOUGH about a month has elapsed since HENRI LEVY died at Nancy, the French papers have ignored an event which deprived France of one of her greatest wall-painters. We published a reproduction of his noble work in the Panthéon, *The Crowning of Charlemagne*, which suggests that he possessed many of the qualities of RUBENS. It may have been supposed, as Frenchmen have become so susceptible, that in undertaking such a work he was displaying a partiality towards Germany. For it is conveniently forgotten by many that CHARLEMAGNE at one time was regarded as the greatest representative of the Gallic race. In that way the relations between French patrons and HENRI LEVY would become strained. According to *L'Art* he was one of the victims of the DREYFUS affair. His ambition was to be a wall-painter exclusively, but he found relaxation in executing small easel works. The market was closed against him because of his name. But the dealers were willing to accept his works if he would sign them with a pseudo-name. He declined, and in consequence the latter days of his life were troubled with poverty.

THE opinion expressed by Mr. JUSTICE WILLS that if a house had stood for forty years it did not matter whether the foundations were good or bad, should an action arise for injury caused in excavations, must have an effect on the carrying out of municipal works. The case arose out of the excavation for a sewer in Askam-in-Furness, in Lancashire, by the Dalton Urban District Council. A house and cottages belonging to the plaintiffs were injured. The subsoil was sand, and it was alleged that as the trench was not properly shored the sand shifted, the walls were cracked and the property was deteriorated. The defence was that the foundations of the house were inadequate, and that precautions were taken by the District Council owing to the nature of the ground and the proximity of the house. The jury of course found for the plaintiffs, leaving the amount of damages to be settled by inquiry if the parties could not agree.

FRENCHIFYING THE STRAND.

THE proposal of a French syndicate to take on lease the central portion of the crescent facing the Strand at an annual rent of 55,000*l.* must have seemed an almost miraculous interposition to the authorities in Spring Gardens, for it would extricate them from a very serious difficulty. English speculators are shy about meddling with the desert which has been created at such enormous expense, while Frenchmen have unexpectedly appeared who are far more enterprising than any body of men which official imagination could anticipate. Is it not allowable for the abused improvements committee to believe that Englishmen will come with a rush to invest in the remainder of the property through fear that Frenchmen will monopolise the whole extent of it?

The public must also have found a prospect of relief in the announcement. The improvement of the Strand is becoming more and more of a bore. There are countless objections raised against all schemes that have been proposed, whether official or non-official. It might easily be supposed that the Strand was a newly-discovered region, and all that was necessary was to arrange the ground in some ideal way by the erection of buildings which would surpass those existing elsewhere in London or continental cities. It is forgotten that every inch of the area is burdened with debt, and that every speculator is therefore handicapped, for the annual rent alone of each site would require returns such as are not easily foreseen. Then the character of the buildings which are suited to such a position is not always evident. Those who are acquainted with the Strand during a number of years are aware that the whole of the frontage from Catherine Street to Chancery Lane was not what would be considered high-class property by valuers. There were few, if any, lamentations when a large portion was taken for the Law Courts. The reason was that no particular class of business was associated with that part of London, and, moreover, people who might become customers preferred to walk on the south side of the thoroughfare. The appropriation of so many sites to theatres and other places of amusement was an indication that the buildings which were superseded were not of extraordinary value.

It is not easy to impart a new character to a street, and there are varieties of business which are considered to be as unsuitable to the Strand at the present time as they were forty years ago. Hotels about Charing Cross are supposed to be patronised mainly by Americans, and special efforts are made to attract such visitors by the shopkeepers in the western part of the street. But towards the eastern part there is no predominating influence that can be discovered, and men of business who hold that demand must exist before supply are therefore chary about erecting premises on the new sites.

The felicitous proposal of the French syndicate agrees to a large extent with tendencies of which the effects have been witnessed for some years. The Strand was often selected as a place for exhibitions before any theatres were erected in it. Several reasons justified CHARLES LAMB'S designation of it as "the motley Strand." Everybody must have felt in King WILIAM IV.'S time that there was an appropriateness in the Lowther Arcade opening out of the Strand, for what exhibition could have for children the attraction of its twenty-five shops? Of late years the theatres have multiplied in it, and there is a belief that no part of London is better adapted for buildings of the kind. The French syndicate contemplate the erection of galleries for art and industrial exhibitions, a French theatre, a French restaurant and café. The average height of the building to contain them will be about 60 feet. On each side of the main building the crescent will be outlined by shops which will have basements and ground and first floors, although the height above the ground level will be only 27 feet. The space between the central block and the shops will be laid out, we are

told, as gardens, and ornamented with fountains, statues and flower-beds. A charge will be made for admission to the grounds. The roofs of the shops will be used as a promenade, to which access will be obtained from the gardens. It is also proposed to erect an open-air theatre for summer use. The promoters anticipate that the buildings surrounding the site will be let to French jewellers, bootmakers, milliners, confectioners, stationers, &c., or will be used as clubs, offices, or for other commercial purposes. Frenchmen are shrewd and wary, and it must be presumed that the people represented by Mr. W. GILBEE SCOTT and M. E. GÉRARD have worked out the financial problem in detail. But English theatrical and restaurant speculators will feel dubious whether with such self-imposed restrictions a rent of over 1,000*l.* a week can be paid in addition to all the other expenses which will have to be provided for. Open-air entertainments in London never have had an enduring success. Those at Earl's Court, which next to the special exhibitions at South Kensington have been most largely attended, can only be held during a brief season. For many years French theatrical companies have been performing in London, but not even Mr. MITCHELL has had the courage to set up a theatre in which performances were to be given throughout the year. French shows would no doubt be alluring, but as several already exist in London they could not be considered as novelties. Besides, English ladies who are the principal customers of such places have a belief, which is not easily shaken, that the French goods sold in England are very different from those which can be obtained in Paris.

The experiment will, however, become a most interesting one if it should be fully realised. The principles on which properties are valued in London may be derived from taking a too gloomy view of affairs. Frenchmen are economical, and they may be able to establish and uphold a business on less expensive terms than the majority of Englishmen. In displaying their trust in Englishmen they may contribute to secure a far larger number of customers than would be possible with English speculators. But it must be owned an establishment is not to be seen in Paris where a long range of shops and residences is of no greater height than 27 feet with a central building of 60 feet, and the whole combination is conducted in such a way as to pay a rent of 55,000*l.* It has almost become proverbial to say that in the business of entertainments they manage things better in France than with us, but it would be interesting to discover one instance in or near Paris where such onerous responsibilities are imposed and where the returns are remunerative to the shareholder.

During many years the houses which were erected in the French capital have had to consist of a great many storeys. Under no other conditions could they be erected and upheld with profit. It is therefore most praiseworthy on the part of the syndicate to set an example of sacrificing rents in order to promote the amenity of the Strand. The proposal could never be more opportune, and those who previously professed to have ascertained by calculation that only lofty buildings can pay should feel rebuked. As the Frenchmen have no magic at command, we are tempted to believe that they consider the laws which control the letting of property in Paris are entirely different from those which can prevail in London. We must also remember, to their credit, that the speculators are superior to prejudice and do not believe all that has been said about the obduracy to gaiety which is supposed to be a characteristic of Englishmen.

The prospect which is held out by the proposal is most fascinating. In the first place, the rent, if capitalised at thirty years' purchase, represents no less than 1,650,000*l.* A sum of that kind will be a desirable element in any attempt at balancing the accounts of the London County Council in regard to the Strand Improvement. The possibility of a delightful garden adjoining the Strand, which will not have a doleful aspect in winter, with

noble specimen of architecture as a background, must possess every inhabitant of London in favour of the project. The self-denying proposals, too, about refreshments are almost enough to turn temperance advocates to shareholders in the adventure. It is promised that a year's ground rent of 55,000*l.* will be paid as a deposit on the signing of the agreement, and that is an excellent proof of the genuineness of the transaction. Financially we must expect the experiment will be successful, or lose our faith in Frenchmen. But it would have an advantage of another kind for them. They are supposed to find a fitting *quartier* in a district of London which is not overprized by Londoners. One result is that the tenants of the dingy houses are taken to be true types of the French people. That is an error, for French gentlemen and French ladies are resident in other districts of the Metropolis and are duly appreciated. Possessing such a centre as is indicated by the scheme they would be able to impart some joyousness to London life, and that service could not fail to be duly acknowledged. Many varieties of the people could be seen; and with better knowledge of their ways an increase of confidence in them would be likely to follow.

NORMAN TYMPANA.*

ALTHOUGH it is more true in our time than in any former age that "of the making of books there is no end," yet there remain certain subjects which are overlooked. Norman sculpture could until now be counted as one of them. We expect that a great many readers when they take up Mr. KEYSER's excellent work will say that they have often thought of anticipating him, and had commenced the collection of materials. The sculpture we still see in tympana cannot be considered as sporadic. It is rather one of the links by which northern, western and eastern Europe were connected, and, moreover, through it Paganism was made suggestive for Christianity. The semicircular or segmental spaces which were formed by the employment of the arches in Norman churches are in form unlike the pediments of Greek or Roman temples. But both corresponded in affording desirable fields for the introduction of sculpture. We do not find in the Norman work such skill in composition as was to be seen at the Parthenon and in the temples at Ægina and Olympia. The Normans we might regard as self-taught artists, and it required many failures before they began to realise the great advantage of a symmetrical arrangement. But enough examples exist to suggest that with their limited skill they were approaching closer to that end when the style was superseded by the conditions which accompanied the use of the Pointed arch. Indeed, one of the attractions of the numerous plates in Mr. KEYSER's book is that we can, as it were, trace the efforts for the improvement of sculpture, and we may easily imagine how difficult progress was in an age when the mason's axe was slowly giving way to the chisel.

It was no easy task to prepare a book which would make this kind of impression on the eyes of the readers. Mr. KEYSER is a gentleman who appears to have an infinite capacity for taking pains for the benefit of other students of archæology. His list of buildings with mural or other decorations runs the risk of being taken for one of the ordinary South Kensington compilations, but it could only have been produced by long devotion to the subject. In 1879 he read a paper before the Society of Antiquaries, which was reprinted in the "Archæologia," on "Norman Tympana," and this fact will suggest how many years were necessary to bring his new book to completion. The majority of the examples relate to the Norman work during one hundred and twenty years, or

from 1080 till 1200. Some may belong to a pre-Norman date, and it is possible that sculptured representations were executed in Norman tympana in the Gothic era. The sources of the sculpture are described by Mr. KEYSER as follows:—

With regard to the origin of these sculptures it has been claimed for them that they preserve the forms and the designs of the early Byzantine style. No doubt, as in the case of the mural paintings, the first examples were introduced by the earlier missionaries from foreign schools of art, and skilled workmen may have been brought from abroad, from Rome, the more cultured portions of France and elsewhere to enrich our ancient churches with sculpture and carving. Several buildings were erected in the time of Canute which would, no doubt, exhibit some of the early Scandinavian ornaments found chiefly on the crosses which are most commonly met with in Scotland and the North of England. It was not, however, till after the Norman invasion, and then not till the twelfth century, that any great advance in the sculptor's art was made, and when the rich examples of which we are justly proud were executed throughout the length and breadth of the land. The Norman ecclesiastics who were imported into this country were no doubt responsible for the introduction of a more enriched form of Romanesque than had been previously attempted, but it seems clear, from a comparison which may be made with a large number of the French tympana (see illustrations in De Caumont's "Abecedaire d'Archæologie" and elsewhere), that a new school of art was speedily formed in this country, and, except in a few instances, we do not find subjects treated in the same fashion as those in France, whether we take early examples such as those at Bourges, or later ones as at St. Trophime at Arles and elsewhere. The west doorway at Rochester Cathedral is a notable exception, as with its series of figures on the arch mouldings, the statues between the jamb shafts, and the treatment of the subject of "The Majesty" on the tympanum, it clearly follows the designs of the earlier and magnificent specimens at Bourges, Chartres, Le Mans and other doorways of the great Romanesque churches in France. Even in Normandy, where, however, we do not find so many of these sculptured tympana as in the south-east and central portions of France, there is a difference in the character and treatment of the subjects represented, and, as in other directions, the individuality of the English seems to have asserted itself in the mouldings and sculptures of the churches.

DE CAUMONT distinguishes between compositions which have unity and patterns which are repeated, like diapering. Among the bas-reliefs in French churches the patron of the parish was occasionally introduced as the principal figure; others were symbolical, but the meaning is now uncertain. However, the subject which was most often selected was, according to him, CHRIST seated amidst symbols of the Four Evangelists. In England we retain a great many plain tympana which were possibly decorated by means of painted subjects, while in others we find such ornamental elements as stars, zigzags, cables, lozenges, &c. They may have then possessed symbolic meanings, but that is a point on which there can be no assurance. At Peakirk is a kind of triple fan, which is reputed to be intended to typify the Blessed Trinity. But as one has more divisions than the other that is unlikely. The chevron is employed in one of the mouldings, and the tympanum was probably arranged to be in correspondence with it. The examples of tympana, considered as a whole, are unequally distributed throughout the country. There is not, for instance, an example from Sussex or Surrey; only two are derived from Wales and one from Scotland. Mr. KEYSER explains this apparent indifference to sculpture by saying:—

This discrepancy may be simply due to the restoration and rebuilding of the churches, which was going on at all periods of our history, and possibly, as in the most recent case at Tetsworth, the most elaborate tympana have been destroyed to make way for work of a much simpler and less impressive style. In the course of modern restoration it is constantly being found that the walls of churches of

* Norman Tympana and Lintels, with Figure or Symbolical Sculpture still or till recently existing in the Churches of Great Britain. With many Illustrations. By Charles E. Keyser, M.A., F.S.A. (London: Elliot Stock.)

fourteenth and fifteenth-century date are in great measure composed of fragments of the earlier structure, the richly-carved mouldings inspiring one with regret at the expediency which caused the demolition of the former edifice. One of the most inexcusable acts of vandalism in this direction was the destruction of the very fine dated church of Shobdon, and the erection in the form of a triumphal arch in Shobdon Park of the splendid chancel arch, the two arches leading from the aisles to the transepts, and the very interesting tympana of the north and south doorways, now gradually getting effaced by exposure to the weather. It is fortunate that these have been delineated by G. R. Lewis in his account of Shobdon Church, and the illustrations in this work may also be of special interest in the future.

As there are 155 examples in the book out of the 210 which are believed to exist, the value of the illustrations as a record must be evident. It is, however, to be hoped that one of the results of Mr. KEYSER's labours will be seen in the greater care given to the preservation of the old sculpture.

In a few instances tympana announce the date of the church. The chancel of the church at Castor is in that way found to have been dedicated in 1124. But in the earliest examples of tympana in England a cross appears as the subject which gained most favour. Sometimes it is left as if standing alone, but generally there are supporters or symbols of some kind accompanying it. At Carlton-in-Lindrick there is a small cross at the apex, and a large rose and floriated cross each within a circle with two small roses on the main portion. Wheels were employed to suggest eternity. A tree served to indicate spiritual life and knowledge. Near the tree a serpent or serpents will occasionally be seen. Various animals appear which have been interpreted as having different significations. They are often of an imaginative kind. A centaur or sagittarius and a lion seem to have been favourites, and they are supposed to mean the contest between good and evil. In the very old chapel on the Rock of Cashel in Ireland, which is reputed as being founded by King CORMAC in the tenth century, the same subject is introduced. But it is maintained by some archæologists that the sculpture is evidence of having been executed at a later period, and that the sagittarius is simply the armorial ensign of King STEPHEN. The Munster lion has a large rectangular mouth, which suggests that he was to serve for a letter-box. It is needless to say a contest between a centaur and a lion appears to have been employed from the first century of the Christian era, and the centaur as a symbol dates from a still earlier period, for it is found on Roman and Etruscan monuments. The hermits were convinced that such compound beings were to be met with in the desert around them. On the bronze door of the cathedral of Augsburg, which dates from the second half of the eleventh century, two centaurs were introduced—one endeavouring to shoot a man, the other a lion. In a church at Zurich female centaurs appear. DANTE imagined centaurs were functionaries in the Inferno. It is possible that they may have had a variety of significations, and we are not always to take the Norman centaur as a sort of western ORMUZD, or principle of goodness.

Archæologists are sometimes amazed at the mocking, irreverent spirit which is suggested by the "Misereres" and other works of the Gothic carvers. But the introduction of animals as representative beings prepared the way for all sorts of divagations. One vigorous tympanum is found in the priory church of Stanley St. Leonard, which is supposed to represent the Fall. Mr. DE KEYSER says of it:—"Two large animals are facing each other, one holding the end of the tail of the other in its left forepaw, while with the right it is offering a circular object, ostensibly the apple, which the second animal seems unwilling to receive. Although one would hardly expect to find so serious a subject treated by a caricature of this kind, yet the general treatment and pose of the figures seems to favour the interpretation which has been hazarded." At Thurleigh we see

the remains of a more satisfactory representation ADAM and EVE, who are on either side of a symbol tree with a serpent coiled round it. The relief is cayed, but the meaning is still sufficiently clear to observers.

Old Testament subjects were not admired by Norman carvers in England. There are two representations of a man overcoming a lion, which may be intended for either SAMSON or DAVID. In the representations of CHRIST He either is suggested by the Agnus Dei or as seated in majesty. An example of Fownhope of the VIRGIN and CHILD is most elaborate for on either side is an evangelistic emblem amid intricate scrollwork. After describing the numerous examples in which the Agnus Dei is introduced, Mr. KEYSER remarks:—"It is interesting to note that there is a considerable variation in the treatment of all the subjects, showing that it was never the practice to carry these sculptures from any stock design prepared for the guidance of the individual mason."

The Resurrection and the Ascension could not have been attempted, or the examples in England must have been destroyed. But of the CHRIST in Majesty over twenty examples are illustrated. To undertake such undoubtedly required much skill, and we might suppose the subjects indicate comparatively late examples. At Betteshanger, CHRIST appears as a youth, but generally He is shown as a vigorous man. To Norman warriors the prowess of St. MICHAEL would appeal. He often occupies tympana. In order that there might be no error, it is recorded on the relief at St. Nicholas, Ipswich, "Her Sce Mihael Fehtid Dane Draca" (Here St. MICHAEL fighteth the Dragon). In our time the figures of SATAN do not excite terror, but in the eleventh century they may have produced a different effect. St. GEORGE, as another warrior, is easily recognised. He is as often shown on foot as on horseback. There may be other saints in the English tympana, but they cannot be identified owing to the absence of symbols. A suggestion of reverence to relics appears to have been expressed by the tympanum at Little Bytham. On the lintel is a series of square patterns filled with leaves. The semicircular outline of the tympanum is marked by similar ornament and two rows of billets. "In the centre," says Mr. KEYSER, "is a deeply-recessed circular medallion, and on either side is a dove within a circle, and a small animal in attitude of adoration, some interlacing circular rings filling up the space below. It is a tradition in the place that here within the medallion was preserved the skull of St. MEDARD, the patron saint (this being the only church in England dedicated in his honour), and that within the memory of some of the older inhabitants an imitation of the skull in white marble had been there enclosed."

One of the uses of Christian iconography is that it enables us to realise the belief of people at the time the images, whether painted or sculptured, were executed. Mr. KEYSER's plates will serve that purpose; they also have value as revealing the state of sculpture during the Norman period. The ornament of capitals, mouldings and architectural details is tolerably familiar. But the tympana called for a higher class of work, unless in those cases where a mechanical representation of one or a few ornamental forms was all that could be obtained. The sculptors, although they might have travelled and fought in Italy, were Northmen, and subjects where they could introduce serpents, dragons and monsters were likely to afford unusual delight to them. In others their hands must have been guided by men who knew something of the simple symbolism of the early Christians. The sculpture conveys a lesson to people of modern times, for the belligerents of the eleventh century believed in the necessity of the union of the arts, and were prepared to pay to have their buildings ornamented by painting and sculpture. Mr. KEYSER has brought into light partialities of the Normans which hitherto were only vaguely understood.

ACADEMY LECTURES ON SCULPTURE.

IN his second address on sculpture on Thursday, February 2, at Burlington House, Mr. Gilbert said that they had separated on Monday with the word idealism ringing in their ears, and on that note he intended to sound to the end, for it should be the student's starting-point and his goal. Since Monday he had made certain journeys in this wonderful city of ours; he had revisited the Elgin marbles, had seen Renaissance sculpture at South Kensington, and had visited also an exhibition that appealed only to the shilling public, where everything was shown realistically, from crowned heads to the lowest criminality. There was taste personal and there was taste public, and the last had nothing to do with them in art—nothing. Realism was good business, romanticism was a struggle, but idealism was only given to those who were prepared to sacrifice their lives in its pursuit. The artist's aim should not be a mere representation of nature, but a translation through his mind of nature's most beautiful qualities. His mind should be so elevated by idealism that it should pass over all the ugly things naturally, and let all that was hideous and sordid, all that could not belong to an artist, pass by. The students sitting before him no doubt chafed sometimes at the nature of certain of their studies, and were disposed to think that of the antique futile. There were some, of course, who held that the study of the living model should come first, and he could not say they were wrong, but in any case it was good that the student, while he was learning, should be brought up to admire such models of form as the antique. They would find greater beauties in the living model from which they were working if they compared nature with the antique and tried to learn how the Greeks attained to such perfection as the Theseus and the Ilyssus. Each was more beautiful than any living person because Phidias imbued his work with his own personality and brought it forth, like another Athene, from his brain. So when we compared the realism of Velasquez with the realism of to-day we saw that the Spaniard never painted an ugly thing—he made it beautiful, whatever it was—and in a portrait he painted the inner person, not the mere face.

Mr. Gilbert said he had just seen in the porter's lodge at the Academy, over the fireplace, a work by Alfred Stevens that he had known for years. It was a portrait study, probably of some old model. When he looked at it he could not help saying to himself, "Now, that is more than a mere representation of the outward—the work of a mind far above the average calibre." The study showed what manner of man Stevens was in other walks of art than those he professed, and it was a valuable possession of the Royal Academy. Mr. Gilbert then turned to the influence of art on great towns as shown in sculpture, and pointed out the efforts in this direction that were made in France and Holland—efforts that sometimes failed, but were generally right in intention. But here, said the lecturer, what did we get? Some one dies, we will say—some benefactor who has introduced the penny post—and instead of symbolising him as they should they set up a statue of him in a costume that in two or three years becomes an eyesore. They don't even call in a first-class tailor. Why should it be thought necessary to drag down a benefactor into ridicule on account of his clothes? Nothing could be more horrible than to provide funds to make a town hideous because the subscribers want to be able to recall the costume and features of those they knew. Symbolism was the greatest thing in art, and all the best things in art were built up round it. Why, then, should we want to make a sort of permanent New Road exhibition of extinct costume? Rather should we try to symbolise the man who had been a benefactor, and to suggest that if he wasn't like that he ought to have been. We artists were blamed for the present state of things—blamed because we don't insist, as we ought, that nature is never art and that art is never nature. Mr. Gilbert referred to Ford Madox Brown's wall-pictures in Manchester town hall as some of the finest combinations of idealism and realism with which he was acquainted, and concluded his address, says the *Morning Post*, with a few pointed remarks on the subject of what he called "side shows." He used the term, as he explained, to express "the little indiscriminate collections of one man's work" that were now the fashion. They did a man no good, and could not show his power because there was nothing to contrast it with. The artist in such exhibitions could not compare himself with others, and comparison and competition were absolutely necessary. Competition was a grand thing—so long as it was not for a pecuniary reward.

Mr. Gilbert in the opening passage of his third address, delivered on Monday, impressed once more upon the students before him that they were not specialists, but artists, and that the sculptor and the painter must regard equally the work of the other. We heard a great deal to-day of the modern revivalism in British art, although there was no such thing as British art or German art or French art. It was all one thing—one great calling. The work of our artists, rich and over-rich as it is in examples, had been by a bad fashion relegated to a second place; but if the matter were inquired into it would be seen that the art of our little island had had a distinct influence upon that of other countries. For our leading in plastic art we looked to France, but there was a *quid pro quo* in the influence that Constable, Turner and others had had upon the work of French painters. Plastic art in England had never been dead but only hibernating, and its revival had come about chiefly through the great educational advance in the country and the possibilities of study that had come with it. Mr. Gilbert said that many statements had been put forward as to the date of this revival in England, but he would like before going into this to speak to them of the influence of a great man whose work—though it might be dead to the students—he had never ceased to admire for its prowess and for its fixed and steadfast purpose. The man was Foley, who towards the end of his days launched out and created something that is still alive through his pupils. The names of a host of men might be mentioned who carried on the work of Foley, and its influence would some day place Foley in a position that has hitherto been denied to him.

Among foreign influences that of France had affected us most in plastic art. The influence came to us through the war of 1870, which sent us Carpeaux, Dalou and many others who handed on to us the impulse that French sculpture had received from the work of Rude. Chiefly the men through whom the French influence came were Carpeaux, Dalou and another who was alive, and therefore might not be named, but who had done more than anyone else to help the British aspirant in sculpture. Dalou's influence came second, but that of Carpeaux was not so strong, because he was more Latin, less classic, than the others. Carpeaux's great group of "The Dancers" in Paris was a masterpiece before which one should take off one's hat. Mr. Gilbert said he would not give "The Dancers" as an example to the student, but no one could see the work without regretting the indignity to which it had been exposed, an indignity of which the marks still remained. There was another foreign influence to be reckoned with in British sculpture, that of Boehm. We discounted his teaching nowadays, but if the students were to study Boehm's work they would see in it the instigation of a new train of thought and purpose.

Passing to less direct influences in the revivalism of art, Mr. Gilbert mentioned music as affecting most things in sculpture and painting. Turning to literature, he paid a tribute to Ruskin, whom he described as the exponent in words of the teaching that Watts had given us in another mode of expression. It was curious, too, how many of our artists in words had been wielders of the brush. Rossetti, for instance, and Burne-Jones too, whose letters and conversation showed him to be a born poet. Madox Brown was a considerable writer, as well as a combination of all the qualities of art. Of William Morris there was no need to speak—they all knew of him—but of another man, who was perhaps more of a poet than a dabbler with sticks and clay, they had perhaps never heard. He spoke of Woolner, whose work he saw at a time when he was full of revolutionary ideas. Although he could not sympathise with it, he could not help admiring it. Mr. Gilbert, who said that his address, to which he had given no title, might well have been called "In Memoriam," then spoke in eulogistic terms of many other artists who have died in recent years, including Leighton, Costa, Millais, Pettie, George Lawson, Onslow Ford and Prinsep. Leighton he described as one of the most remarkable all-round men that England had seen—a painter, a sculptor, a man of the world and a great trustee and guardian of British artists and of all artists who came here. The Colossus, Millais, a man unequally understood but always great, was a master whose work was one of the jewels in the crown of the Royal Academy.

In conclusion Mr. Gilbert referred to his remarks on Thursday concerning the influence of art on great cities. He had not said anything then about the influence of great cities upon art, which was a different matter altogether.

Modern developments and modern education had made corporate bodies realise that their cities should be beautiful. When he was young all the monumental work and the designing of monuments for cities was given to two or three men. Everyone knew to whom a commission would fall. One of the healthiest signs of the sculpture of to-day was that this kind of work was no longer a close business. There was a chance for the young man now, for the great cities employed the talents and brains of the artist—whatever his age or standing—whom they believed to be the most capable.

WOLVERHAMPTON AND DISTRICT ARCHITECTURAL ASSOCIATION.

THE annual meeting of the Association was held at the Law Library, Lych Gates, Wolverhampton, on January 26, when Mr. Fred. T. Beck, president, delivered the following address:—

The study and practice of architecture incites a mysterious interest in mythology, antiquity and romance, such as can only be obtained by serious application, deep reading and vigorous attention to detail. It also requires, at any rate so far as the practice is concerned, a knowledge of every trade connected with the erection, construction and completion of buildings, and a ready and resourceful mind to grasp the general outline of the conduct of almost every other trade and profession with which one may be brought in contact when acting in a professional capacity.

The consideration of these facts causes a doubt in my mind as to whether they are ever properly explained to young aspirants for the profession on their first introduction, and I fear that in many cases the awakening has gradually developed into a feeling of despair and hopeless regrets. On the other hand, the result is that many outside the profession, especially such as are of a sentimental turn of mind, study those portions of the subject to which they are most susceptible, and which are generally the most attractive and interesting, and believe themselves to be equal in all respects to fully-fledged practitioners, but quite superior to them in respect to the particular lines they have interested themselves in. I have known men who even boasted that they could make their own plan, only wanting the construction and design arranged for them, and were quite hurt if any improvements in the planning were hinted at; others who habitually criticise design, but only acknowledge their part in the work if it turns out a success, in which case it is difficult to decide what part the architect took in it at all.

Bearing in mind these facts, some light is brought to bear on the reason why so many works of importance are entrusted to be carried out under the supervision of those who have had no proper architectural training whatever, to the detriment of those who have not only had to work hard, but also to pay heavily for their professional education. I suppose that in other professions the amateur who persuades himself that he has become more or less acquainted with their principles also turns up at times—for we have the amateur lawyer as well as the amateur doctor, or quack—but there is certainly this difference to be observed, that however much they ingratiate themselves with, and become recognised and encouraged by the general public, they do not appear to gain credence with governing bodies and municipalities. In our profession the case is different, and I regret to notice that in the encouragement of such improper and injudicious proceedings the labour representatives—who, should a strike occur in the building trade, always appeal to the architects to support their views—are the worst sinners. Evidence of this fact we need not go far to seek and find.

I do not, gentlemen, for one moment refer to any municipal body in particular—only to public bodies and municipal governing authorities in general; but there appears to be lamentable ignorance abroad as to the difference between a civil engineer, a borough surveyor and the profession we represent. When considering this subject it has always appeared to me paradoxical that those who are so careful to guard the interests of each particular trade by protest and active opposition to any encroachment of one on the other should be first in supporting the violation of that principle in the carrying out of works under their control. To suppose that economical reasons guided them would be, I feel sure, a slander on their intelligence, and even if one could go so far, recent events prove the negative character of their views.

This action tells particularly heavily on us at the present juncture, and notwithstanding these depredations on our

justly claimed means of livelihood, the exactions in the way of rates and taxes are on the increase, and we are bound to pay and help to support a system which, while depriving us of our means of existence, affords to officials already endowed with good salaries commission for carrying out works which should fairly be placed in our hands. Possibly it may be worthy of our consideration to invite some of such representatives to meet us to discuss the situation and to explain our case.

I feel justified in addressing you to-day on these matters not only in consequence of recent events, but also because another menace to our profession appears to be growing on the part of educational authorities, who are engaging the services of officials (who in some cases are trained members of the profession) to carry out the works they may have in hand at a comparatively small fixed salary, instead of employing independent members of the profession on the usual terms. This, gentlemen, cannot tend to efficiency or economy, especially as we know that in course of time the amount of work accumulating in such offices must inevitably result in juniors being entrusted with important undertakings, or else the staff is unduly increased. Can we under the circumstances longer refrain from making a bold and united attack on this injustice, is a question for all of us to give very earnest consideration.

To publish abroad an evil, however, without the suggestion of some definite means of rectifying it is, you will say, of very little utility, and I venture to suggest that we should take every opportunity of putting strongly before those who are responsible not only our views, but also our claims and the objects we desire to attain. And here I would briefly suggest the principles we may agitate for, subject of course to such modifications as further consideration and wisest counsels may approve, viz.:—

1st.—That all works of a monumental character or national importance should be open for competition to all architects in the kingdom on fair and reasonable terms and conditions.

2nd.—All works under the jurisdiction of the county authority be either competed for by those practising within the county or generally divided as occasion arises among them.

3rd.—That works under municipalities be given out in a similar manner among architects practising in such municipality.

4th.—All salaried officials shall confine their attention to works for which they are specially trained, and in no case to the carrying out of new buildings or extensions to existing buildings, but only to such alterations as may not involve enlargement; and in the case of borough engineers to street and drainage works pure and simple, including of course advising the Council on plans submitted for their approval. Also that a limit shall be placed on the number of their staff according to the size and importance of the municipality where engaged.

5th.—In all cases where professional men are engaged the usual terms of payment shall be observable in all respects, whether it be necessary for them to work in conjunction with the salaried official or not.

6th.—Salaried officials to be allowed the privilege of taking pupils under certain restrictions and limitation.

Other suggestions and principles must, of course, arise in working out a scheme for our acceptance, and I merely put these before you to-night as a preliminary introduction to the system we might aim at. As heretofore implied, I have gone somewhat fully into this portion of the subject because it is one of such immediate interest and importance, and one point I wish most particularly to emphasise is that we are not reflecting on or criticising the actions of any officials; in fact, we most earnestly feel that our scheme would tend to their betterment, enhance their position, and relieve them of many unfair and troublesome responsibilities. There are numerous other troubles which handicap us in practising our profession, which I do not propose to enter on to-night, but rather to postpone until some other suitable occasion—the consideration of the position and relationship of architect and client, principal and assistant, pupils, and the extent to which specialty should prevail in an architect's practice.

Before finishing my remarks I desire most sincerely to express to all members of the Association my gratitude for the kindness and forbearance shown towards me during the year I have had the honour of presiding over it, how deeply I appreciate the honour, and my earnest wishes for the continued prosperity of the Society and each and all of its members, as well as my sincere appreciation and thanks

for the honour conferred by re-electing me to the position. I must also once again refer to the passing away of our dear friend, George Hurst Stanger. The day for regrets and mourning is now past, and I would rather we should rejoice as we contemplate the pleasure with which he always rendered his fullest share of duty and responsibility in the formation and progress of this Association. May we hope that to him this life is even now but a happy incident in his progress to higher attainments in the service of his Maker.

EXPLORATION IN CRETE.

THE annual report of the "Cretan Exploration Fund," which was issued to subscribers about six weeks ago, summed up the results of the season of 1904, both at Knossos, where Dr. Evans was continuing his successful labours, and at Palaikastro, where Mr. R. C. Bosanquet, the director of the British School at Athens, was, with his colleagues, carrying on the important excavations begun on that site two years before.

At Knossos not only did Dr. Evans discover considerable extensions of the palace, says Mr. G. A. Macmillan, but also came on a paved roadway leading to important Minoan buildings, outside the palace area, which from various indications seem not unlikely, to have been the royal arsenal. Moreover, he found on a hill about a mile north of the palace a series of tombs, containing both jewellery and vases of great interest and beauty, while still further away in the same direction he discovered a yet more important sepulchral monument, for which he was tempted, from its size, design and contents, to suggest a royal attribution.

Mr. Bosanquet's work at Palaikastro laid bare a further area of the Minoan town; cemeteries were opened and yielded interesting contents, and the discovery of a marble slab with a Doric hymn in honour of the youthful Zeus seemed to establish the site of, at any rate, one of the temples of Zeus Diktaios.

The managers of the Cretan Exploration Fund and the managing committee of the British School at Athens hope to carry on the work both at Knossos and at Palaikastro during the coming season if sufficient funds are available, and the main purpose of the committee is once more to appeal to the public to provide the necessary sum.

The accounts recently published show that the 1,800*l.* raised last season was not quite sufficient to cover the expenses. The fund therefore starts the new season not merely with an empty exchequer, but with an actual deficit of more than 200*l.* It is estimated that to do all that Dr. Evans contemplates at Knossos during the coming season a sum of about 2,000*l.* will be required. At Palaikastro they can, no doubt, make good use of at least 500*l.*, though some part of the cost can be met by the school from its own resources. Towards the sum of 2,500*l.* new subscriptions amounting only to about 200*l.* have been received, while a further grant of 100*l.* has been voted by the Hellenic Society. These facts speak for themselves as to the urgency of the need if this valuable work is to be carried to a successful conclusion.

THE CAMPANILE, VENICE.

THE committee entrusted with the superintendence of the work in connection with the re-erection of St. Mark's Campanile, says the correspondent of the *Glasgow Herald*, has published particulars of the progress made during the past year. The report states that during 1904 3,076 trunks of larch trees, having an average diameter of 8 inches and length of from 12 to 13 feet, have been driven into the ground around the old foundations, which have been thus strengthened sufficiently to bear a load of 16,000 tons and support a pressure of 4.82 tons to the square foot. Larch trees have been used in preference to oak, as their trunks are straighter. The spaces between these piles have been filled up with cement and stones, the whole forming a solid and reliable base on which to raise the superstructure. This foundation has been further strengthened by placing above it a further row of piles laid lengthwise and covered with cement. Up to the present the total expenses connected with the work amount to 115,588 lire (or about 4,623*l.*), 79,914 lire having been spent during 1904 and 36,674 lire in the preceding year. Still greater precautions are to be taken to insure the stability of the new structure, and it is estimated that before the base is considered thoroughly reliable a sum approximating 8,000*l.* will have been expended.

NEW MAGISTRATES' OFFICES, SOUTHAMPTON.

THE following notes on a perspective published in *The Architect* of January 27, entitled "New Magistrates' Offices, Bargate, Southampton, Mr. E. F. Harmer, architect," have been sent to us by Mr. R. M. Lucas:

1. The perspective illustration professes to represent an actual building, and the actual building that will stand on the site. 2. Mr. E. F. Harmer announces himself as the architect of that building, and has made no correction. 3. The illustration shows features apparently taken from my revision of the official elevation. 4. Where it does not show these features, it makes no departure, except in one or two easily understood cases, from representing the official elevation.

The features referred to are:—1. The thickening of the timber generally. 2. The omission of all the timber cusping. 3. The actual number of timbers in certain defined spaces. 4. The stopping of the stone string at a certain point. 5. Substitution of splay-sunk triangles for carving. (In the window heads carving *outside* the line of reveal was shown.) 6. A roadway is shown right through the Bargate.

THE LATE THOMAS BLASHILL.

AT the conclusion of the formal business at the meeting of the Surveyors' Institute on the 30th ult. the President said:—"Since we last met the Institution has lost an esteemed member and the Council a valued colleague by the death of Mr. Thomas Blashill. I will not dwell on our lost friend's many high qualities. They are known to you all. But I cannot allow the occasion to pass without a tribute to the gifts, mental and moral, which enabled him, without influential connections or social advantages beyond the common, to attain to the important and responsible position of superintending architect to the London County Council and to a seat on the governing body of this and a kindred professional Institution. Though some of us did not, on every occasion, see eye to eye with him on questions of public policy, none of us ever failed to recognise and appreciate his absolute honesty of purpose, and the spirit of sturdy independence which characterised all he said and did in every relation of life."

AMERICAN SCHOOLS.

A PAPER was read at the meeting of the Illinois Society of Engineers and Surveyors by Mr. F. Oswald on "Schoolhouse Construction." Buildings with a capacity of more than 800, he said, should be built entirely of fireproof material. The very small ones might be constructed of wood. The floors should be constructed for a live load of 80 lbs. per square foot. In the plans great importance should be given to the lighting and ventilation and to the comfort and safety of the scholars. Stairways should be not more than 4 feet wide, so that only two files could pass down them. The height of steps in primary schools should be 7 inches. The windows should be double-glazed, as this saved 30 per cent. of the heat lost through single-glazed windows. The amount of glass surface should be one-sixth the area of the floor.

The Ceremony of unveiling the memorial of the late Archbishop Temple in Canterbury Cathedral, which is in form of a bronze kneeling figure of the Primate in his robes, holding a book in one hand, is postponed until after Easter. The statue is of heroic proportions—about 7 feet high—under a canopy, supported at the four corners by angels. The monument has been erected at a cost of about 2,000*l.* by direction of the London committee of the Temple Memorial Fund, and was designed by Mr. W. D. Caröe, architect to the Dean and Chapter, the sculptor being Mr. N. Hinch.

The Lord Provost's committee of Edinburgh Town Council approved of a sub-committee's recommendation that a site on the Calton Hill be suggested for the erection of a new Scottish National Gallery by the Government, and that, if the Government approved, the Corporation should give facilities for its acquisition, but if the suggestion did not meet with approval, the Corporation would be glad to give consideration to any proposal which might be submitted to them by the Government.

NOTES AND COMMENTS.

THE competition for the model dwellings which are to be erected by the ROTHSCHILD family near Paris has certain novel points, or at least some which do not correspond with English procedure. The carrying out of the buildings will be entrusted to a bureau of architects who will have a fixed stipend. M. NENOT is to act as consulting architect. Designs are, however, to be sought, and possibly some of the competitors may be given the opportunity of being selected for the bureau. From the drawings sent in for the first or general competition the jury can select as many designs as they consider necessary, and the authors will be invited to take part in a second competition. The second competitors may alter their designs to any extent they think desirable, and each of them will receive an indemnity of 60*l.* The jury will award premiums which will vary from 160*l.* to 400*l.* But apparently the whole sum to be distributed in indemnities and premiums will not exceed 2,000*l.* The designs will, of course, be employed to afford inspiration to the bureau.

"THRIFT, thrift, HORATIO," in regard to artist's work is often observed by Government departments, and is no doubt supposed to compensate for extravagance in other forms. The latest instance affects the reputation of ALFRED STEVENS. Mr. GILBERT, R.A., did not exaggerate when he said he could not understand how anyone could stand before one of STEVENS's works without taking off his hat. That would appear an absurdity to the notorious AYRTON, who worried the great artist almost to death. He at least demonstrated to his own satisfaction that if tested by the scale and traditions of the Office of Works, sculptors and market gardeners stood on the same level. Dean MILMAN, although a playwright and a poet, agreed with the First Commissioner. To him, STEVENS's design for the WELLINGTON monument was an absurdity. At a later time an effort was made to complete the work which STEVENS left unfinished, just as in the old days weaklings endeavoured to use the bow of ULYSSES. But the climax we hope has been reached more recently. STEVENS's lions, which he designed for a railing in front of the British Museum, are no longer required. If one were sent to each museum or art gallery in the country it would be a lesson in applied art. But authority has decreed that several of them are to be used for a railing around the WELLINGTON monument in St. Paul's. Poor STEVENS did not consider a barrier was necessary, but officials who controlled and hampered his work during his life have come to the conclusion they can improve it after his death. The treatment of the lions, it is needless to say, does not correspond with any part of the memorial, for they are more archaic in style, but that, of course, is an incident which, to the official understanding, counts for nothing. How many more degradations is the monument destined to endure?

ILLUSTRATIONS.

MOUNT STUART, ISLE OF BUTE, N.B.

WESTMINSTER CATHEDRAL: TOWER FROM SOUTH-EAST.

THE CROFT, BURY ST. EDMUNDS.

LYMPHAM RECTORY, SOMERSET.

LYMPHAM new rectory cost 2,300*l.* It is built of Bridgwater brick, with Doulling stone windows, the roof being covered with Roman tiles. The builders are Messrs. DENNIS, Westbury, Somerset. As the foundations are a difficult matter in north-east Somerset, owing to the depth of peat which underlies a strata of clay, it was necessary to make the footings of cement concrete. The architect is Mr. E. SEDDING, of Plymouth.

THE CASTLE OF NUREMBERG.

MR. HAIG could not take in more than about a third of the castle, as it is a very extensive place and of exceedingly irregular form, consisting of a variety of buildings, some of which were constructed purely for defence, and others for the residence of the Emperors, together with chapels, gates and towers. At the left corner of the sketch we see just an angle of the great so-called Funkeckigen Thurm, or five-cornered tower, and to the right is the round tower, called the Westner-Thor Thurm, the top of which is the highest point of the whole town. Then beyond the buildings is seen just the top of another tower, called the Heiden Thurm, or the heathen tower, which is supposed to be the oldest part of the castle; but it is uncertain whether this tower, with its adjoining building, or the Funkeckigen Thurm, was the work of CONRAD I., who is said to have built himself a castle here. What is known is that the earliest date that can be affixed to the castle is some time in the tenth century, and it is doubtful whether any part of the town itself is older. FREDERICK BARBAROSSA added to it after CONRAD, and the great Kaisers had a preference for this castle as a residence, living here at intervals from the time of the Emperor HEINRICH III., circa 1050, to that of the Emperor JOSEPH I., 1704. Even as late as the nineteenth century royalty occupied the castle, for LUDWIG I. of Bavaria and his Queen resided here in 1833 and 1840. The bastions, of which a portion is shown to the right in the sketch, were built under the direction of the Italian architect, ANTONIO VASIANI, in 1538, and as some hundreds of the inhabitants were compelled daily to labour at these works, a serious rupture at one time nearly took place between the town and the Markgraf VON ANSBACH, the commandant. The rock forming the foundation of the castle has in many parts been strengthened, and its crevices filled up with masonry and brickwork, resulting in a charming variety of colour. The trench is still called Schnepferleinsgraben, a name remaining from the times when it was the resort of the townsmen to engage in practice with the crossbow.

COURTYARD OF AN ANCIENT PALACE, MALINES.

THE building here represented by Mr. HAIG possesses some interest to the student of the history of the Low Countries, as having been at one time the residence of the celebrated Princess MARGARET OF AUSTRIA, daughter of the Emperor MAXIMILIAN I. and MARY OF BURGUNDY. Here also no doubt were spent some of the early years of the afterwards powerful Emperor, CHARLES V., her nephew, whose education had been entrusted to her, and here she exercised for many years a powerful political influence over the fortunes of the Netherlands. The neighbourhood possesses many interesting historical associations, and it is much to be regretted that of the reputed magnificent palace of CHARLES V., which was situated scarcely a hundred yards to the south from here, there is not now a vestige left, except a few fragments built into various rude walls. Now so exceedingly quiet, the town of Malines has seen stirring times, and the wonder is that there is anything old left at all. First the wars and then local vandals have from time to time removed many landmarks of history, but still the town possesses enough in its fragments of ancient architecture to make it rank with the most interesting of the cities of Flanders in antiquarian wealth. The present subject has been much dismantled. An arcade of late Gothic character adorns a portion of the quadrangle; the windows, partly blocked up, are of varied design, showing the same mixture of early and late Gothic forms of arches, as well as the later square-headed and transomed windows, which may be observed in so many houses in Bruges, Ghent and other towns of Flanders, suggesting a Spanish influence. The courtyard is sufficiently bare and bleak now, but with the exception of a blocked-up arch and window having been opened up in the drawing, the building itself will be found as it is here represented.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. John Belcher, A.R.A., president, in the chair.

Mr. ALEXANDER GRAHAM, hon. secretary, announced the decease of Mr. George Hurst Stanger, of Wolverhampton, Fellow, elected 1892, and also of Mr. Walter Aston, of Manchester, Fellow, elected 1901. Mr. Graham further announced that the late Mr. J. T. Wimperis had bequeathed to the Institute the sum of 1,000*l.*, "to be applicable at the entire discretion of the governing body for the time being of the said Institute, for the encouragement and promotion of the study and knowledge of architecture or other purposes of the said Institute." Continuing his remarks, Mr. Graham said he had also the satisfaction of announcing that Mr. Macvicar Anderson had given twenty-four Architectural Union 10*l.* shares, and Sir Aston Webb nineteen Architectural Union 10*l.* shares for the purpose of promoting architectural education.

Royal Gold Medallist.

The PRESIDENT said Sir Aston Webb, R.A., had been nominated by the Council as the recipient for the Royal Gold Medal, and his name would be submitted to the King for approval.

The PRESIDENT then read the following:—

Address to Students.

Fellow-students of the art of architecture,—I address you all as fellow-students, for with us, as I dare say you know, it is "once a student, always a student."

Our service is not for a term of years; the brief period of formal apprenticeship is followed by another very similar in its abiding purpose to what the Germans of the old-time guilds used to call a youth's *Wanderjahre*—with this difference, that our period of *Wanderjahre*, our earnest search after the best, only terminates with life itself. We must always take a watchful interest in all that pertains to our art, and be ready, all of us, old and young alike, to assimilate every real advance, every true development. To you who are now serving your term of formal apprenticeship I say, Make the most of your opportunities, for they will pass all too quickly. The time thus dedicated to the acquisition of knowledge and the attainment of proficiency, to the training of your powers of observation and imagination, will prove all too short for the end you have in view. The mistress we serve is a jealous one; and if we would woo her successfully, we must be prepared to make sacrifices and to forego many indulgences. The ordinary amusements and pleasures of youth will often have to give way to the claims of your art, to the duty of sketching or measuring, or to the duty of constructive art; in short, you must be ready to avail yourselves of any and every opportunity that may present itself for enlarging your experience and knowledge. Above all, take your art seriously, for it is only to the earnest student, we may almost say to the devotee, that the veil is lifted that shrouds the mysteries of our art. It is with the greatest interest that year by year we examine the results of your efforts, and with the best of good wishes that we assign reward and prizes. There are many who have not won prizes who yet have accomplished very good work—work which will stand them in good stead in after-life. To all I would say, "Do not rest upon your laurels; preen your wings for higher flights." The knowledge and discernment you have already acquired are as nothing to the more subtle secrets, the more hidden beauties, that await your earnest search.

I do not propose, nor is this the occasion to discuss, the course of study necessary for the initial equipment of the architect: that is a matter which is being carefully threshed out by the Board of Education. Nor will I venture to criticise in detail the admirable drawings submitted; this will be done leniently and sympathetically, I have no doubt, by Mr. A. N. Prentice. But I do want to take this opportunity to emphasise the importance of a more systematic study of those buildings which are universally recognised as good. "*Quod semper, quod ubique, quod ab omnibus*" is a dictum which we may very well borrow from the theological schools and, having borrowed, stick to. Moreover, I should like to suggest certain methods to be adopted in the study of such examples. The student's first impulse perhaps is simply to annex the whole subject as "stock" or "copy." Now, certainly it is a very right and proper thing to sketch the building as a whole, but while doing so we must not let our thoughts lie idle; we should endeavour to discover why the subject is beautiful or admirable, what are the elements in it which

have contributed to that result. At first, it may be, such an effort seems to go unrewarded, but if the habit be persisted in intelligent perception will awaken, little by little the light will grow, and soon it will be quite easy to disentangle from the mass, as it were, those characteristics, those laws, those conditions, which have made the building what it is. While traversing some particular line, for instance, note its relative proportions to the other parts. Follow out, if you can, the methods of construction, and mark how the effects are produced. Examine the general masses from various points of view and study the composition of your subject, not only in respect of its component parts, but also in relation to its environment. The latter is of great importance, for one of the chief elements of success in a building is its adaptation to its surroundings. Here it is especially that "scale" comes in, for the scale of a building must be either in keeping with or in contrast to adjoining buildings or objects, just as colours must either match exactly or be complementary to one another. Scale is relative and determines the proportion of one part to another and of the several parts to the whole. It is like the dominant note or key in a musical composition. You are probably all of you aware that sounds which harmonise and please the ear have fixed relations to one another. For instance, if you strike an object of a metallic or otherwise resonant nature, a trained ear can distinguish three notes in conjunction—viz., the fundamental or keynote, and the third and fifth in the division of the octave. These "harmonics," as they are called, will be most clearly recognised in listening to the sound of a large bell. Colour also has its divisions and harmonies, and you will not get far in architecture without discovering that here also similar laws hold good, and that there is such a principle as a true proportion of parts in the scale of building. It is only by a diligent study of and a careful regard for these laws that we can effect a harmonious composition, which all the same can never be merely mechanical in architecture, any more than it can in music. There is as wide a range of possible combinations and developments in the one case as in the other. The great architects of every age and every country have exhibited as wonderful a variety of progressions and characteristics as can be found in the works of Mozart, Beethoven, Mendelssohn or Wagner. You should also have regard to the aspect of the building you are studying—whether it is situated in the narrow street, the broad thoroughfare, or in open ground. Note how the projections and lights and shadows are determined on each frontage. Where the sun penetrates reflected light may be taken advantage of. Projections and shadows on a south front are by no means the same as they would be with a north aspect. How well Vanbrugh, amongst others, understood this! I mention Vanbrugh because his insistence on this point is so obvious.

It is only thus by analysing and searching out the guiding principles which have actuated men in the past that we shall really profit by a study of their work. If we can discover the sequence of thought which has guided them in the achievement of fine results, we in our turn may, by taking thought, successfully work out the problems which come before us. Depend upon it, that which we admire in their work is not the result of careless, accidental, or haphazard arrangement of materials. No, there is thought behind it all—sometimes naïf and immature, and sometimes even "smelling of the oil;" but there it is, and the best results are just those upon which the best thought has been expended. If genius is not, as it has been defined, "an infinite capacity for taking pains," at any rate in architecture, it is very nearly akin to an infinite capacity for taking thought. The best thought, however, does not advertise itself, and the best work is not necessarily that which first arrests our attention. How often has it been our experience in the past, when going to a place a second or a third time, to come across some excellent building which altogether escaped our notice on a previous visit. Rely upon it, such a building will repay careful examination. Do not be misled by the apparent simplicity of much of the best work, for this very simplicity, if not the outcome of profound thought, is the triumph of a practised genius. "Through the complex to the simple" is almost a law of mental evolution. Do not therefore fall into the error of a certain member of a building committee who remarked to the assessor in a competition, "I cannot understand why you have put So-and-So's design first. It is so simple—anybody could make a plan like that." When it was pointed out to him how difficult the other competitors had found their task, and how complex and incoherent some of their designs were, it began to dawn upon him that perhaps

there was more in Mr. So-and-So's design than met the eye of a casual member of a building committee. When you are making a study of a subject it is upon the work as a whole that you should concentrate your critical acumen. Do not allow your attention to be diverted by attractive or suggestive bits, and do not wander off into the by-paths of archæology. When you study mouldings, for instance, or similar features of a building, do not regard it as an opportunity for speculating what date, style or period it belongs to, but regard it from the point of view of its true purpose and meaning. In the case of the mouldings, consider not merely their beauty of form, but their effectiveness in affording shadow and protection. Archæology has its place, but it should be kept there. It often usurps the interest and attention which ought to be given to the example as architecture. The glamour of historical romance has served to invest many a building with a purely factitious value. The accidental effects of age and decay appealing to the sentiment of the man pervert the judgment of the artist, to his own detriment and that of his art. This same sentimental halo, hanging around all that is ancient, is responsible for the many imitations, forgeries and affectations which have so long dogged the footsteps and hindered the progress of genuine architecture, and which in some cases have proceeded to such an extreme of absurdity as to tempt men to forswear the past altogether and to rely upon their own creative faculty to invent something altogether new. This is the other extreme of folly—for folly it is to think that our inherited traditions can be safely ignored, or that buildings which have stood the test of time and criticism have nothing to teach us. They are, on the contrary, as mines of wealth in which, digging deep, we shall unearth many a hidden treasure.

They put before us problems—and their successful solution. They portray many various methods and effective combinations, suitable forms adapted to different materials, varied textures serving a definite purpose, and other elements of beauty and strength which, if not always entirely realised, are yet present as an ideal which we may all study with advantage and strive to express in our own work. So I say to you, my youthful fellow-students, Steer an even keel, if you can, between the Scylla of a superstitious and sentimental regard for the past and the Charybdis of a contemptuous indifference to all its works. If an example is merely old, leave it alone; if it is artistically good, approach it with all reverence, and examining its structure within and without endeavour to discover the secret of its charm, even as a bee extracts the honey from the flower. Do not make the mistake of supposing that you will necessarily be able to define the exact nature of the secret.

There are principles of architecture as absolutely reliable and yet as vague and ill-defined, as much "in the air," if you will allow the expression, as the laws which govern musical progressions or the methods which underlie true literary form. In no one of these cases can the subtle secrets of the art be distilled in the form of express and mechanical rules. If we desire that our own powers may be moulded and guided on true lines we must, as it were, live in the storehouses, continually absorbing the spirit of the masters as embodied and expressed in their works. Centuries of experiment and criticism, generation after generation of trained perceptions and cultured intelligence, have gone to determine what is good, what is beautiful, what is true. Shall we throw away the results of all this? Rather let us recognise and admit that our knowledge should be based upon the experience of those who have gone before, and our taste trained and refined in the study of the cultured monuments of the past.

As Professor Clausen has said in reference to paintings, "The work of our own times may lose its freshness and interest in a few years, while the older works still hold us with an increasing charm." There are many ancient buildings in our own and every land which hold us with an ever-increasing charm, a charm attributable to their simplicity and self-restraint, their sincerity and directness of purpose, the straightforward and appropriate way in which they declare their object and intention. Every such building will be found to possess a vitality of its own which, so far from ignoring traditional methods, has taken them up and carried them on a stage further. So now the proportions and values which have determined good effects in the past must hold good to-day. The needs of the time, it is true, call for special and characteristic expression; we may have to readjust, to combine afresh; but every new departure, if it is to be true and lasting, must take the old

as its starting-point, the past as its basis, that which has been already accomplished as its foundation.

In all good work we shall discover a perfect blending of science and art, so combined that it is impossible to say where the one ends and the other begins. Where these are divorced there can be no true architecture. A steel-constructed building, for instance, cased with terra-cotta—or any other material for the matter of that—is not architecture at all. In studying a building this is the first test to be applied; this is the standard to which we must first submit it for judgment. Do not begin by sketching or noting merely surface decorations or artistic embellishments; rather take the details of construction as your starting-point. Note the size and bedding of the stones and the position of the joints—elements of beauty which are too often overlooked. Examine the methods of support and resistance, not thinking only what is necessary, but also how it satisfies the eye. Discover the scientific and mathematical problems which have been successfully worked out. Yet do not even in thought separate the science and the art of the building—the two are conjoined and must be studied together and simultaneously. The building must be solid and strong as well as graceful and pleasing. Stability is demanded no less than beauty. In fact, good construction, including the right use of materials, is a prime essential and the foundation of all excellence in architecture. Nowhere, I think, is this more forcibly demonstrated than in the career and work of Sir Christopher Wren; who, both by education and the bent of his youthful genius, seems rather to have been of the scientific and mathematical than of the artistic order of mind. Though, like all educated men of his day, he took an intelligent and cultured interest in architecture, he received no special training for such work. Wren took his degree at Oxford at the age of eighteen, became a Fellow of All Souls at twenty-five, and three years later was made a D.C.L. of Oxford and an LL.D. of Cambridge. Obviously it was not upon the ladder of architecture that he rose to these distinctions. As a matter of fact he was professor of astronomy at Gresham College, and in mathematics and astronomy he acquired for himself a European reputation. He was also President of the Royal Society in 1680.

I have adduced these facts to show that though he undoubtedly possessed a very wide range of general knowledge, and was endowed with natural gifts of a wonderfully high order, all these were in the early part of his career directed to the practical side of life rather than to the artistic. His art was dormant; it was there, however, and he sometimes gave the rein to it a bit, for he is said to have invented mezzotint, or at least some improved method. It is interesting to speculate what it was that finally drew all his wonderful gifts and powers into the service of architecture. Whether the determining impulse came from within or without—probably a bit of each—I cannot doubt that it was the scientific or constructive side of architecture that attracted him in the first instance, and that led him to accept an appointment as Assistant Surveyor-General of His Majesty's Works. In our own experience we find cases where we are much more impressed by the constructive beauty of a building than by any other feature in it. So there is an order of mind to which power and fitness of purpose appeal with unusual force, just as, again, a mathematical mind finds a fascination in the treatment of solids and voids and of superincumbent masses. The first important work entrusted to Wren in his new office will serve to indicate not only the natural bent of his mind, but also the official appreciation of it on the part of the authorities. He was set to examine and report upon St. Paul's Cathedral, which it was feared was in a dangerous condition. It is evident from the report that he did his work thoroughly—the very first thing he did was to measure the whole building carefully—and the insight and experience that he thus gained in constructive work stood him in good stead afterwards. With respect to the roof he says:—"It is evident by the ruin of the roof that the work was both ill-designed and ill-built from the beginning—ill-designed because the architect gave not abutment enough to counterpoise and resist the weight of the roof from spreading the walls. . . . This also may be safely affirmed not only by an architect taking his measure from the precepts and examples of the ancients [you see he advocated this], but by a geometrician (this part being liable to demonstration), that the roof is and ever was too heavy for its abutment; for the eye alone will discover to any man that those pillars, as wide as they are, even 11 feet diameter, are bent outward at least 6 inches from their first position. . . . The bending of the pillars was facilitated by their ill-building, for they

only cased without, and that with small stones—but within nothing but a case of small rubbish stones and much mortar, which easily crushes and yields to the weight." Good old times those. Jerry-building is obviously not a very modern institution. Then, too, Wren's first problem in building was a constructive one, for in the wonderful roof of the Sheldonian Theatre at Oxford, which has a span of 68 feet, the scientific construction is masterly, and brought him great reputation. Two years later, viz. in 1665, occurred the Great Plague, and Wren took the opportunity to pay a visit to France to study architecture as an art. In Paris he studied all the principal buildings, and became intimate with the most celebrated artists there. He was introduced to Bernini, who showed him his designs for the Louvre, for which he says in his Notes he would have given his skin. The old Italian would not let him study it long, and he says he only had time to "copy them in his fancy and memory, and shall be able by discourse and a crayon to give a tolerable account of it." He also studied Fontainebleau, St. Germain and Versailles. Of the last-named he says:—"The mixtures of brick and stone, blue tile and gold make it like a rich livery—not an inch within but is crowded with ornament." Wren's own work was subsequently distinguished by its colour effects and contrasts of texture. He adds, in the letter from which I have already quoted:—"The women as they make here the language and the fashions, and meddle with politics and philosophy, so they sway also in architecture. Works of filigree and little trinkets are in great vogue; but building ought certainly to have the attributes of eternal, and is therefore the only thing incapable of new fashions." These words coming from the man who advanced the architecture of the Renaissance to such a pitch of excellence and succeeded in establishing an English tradition fine in type and grand in scale—the importance of these words, I say, as a guiding principle for the student cannot be over-estimated. I hope I may be pardoned for quoting so freely from Wren, and for enforcing my points by the history of his career; but his methods of study and the line of his development are so clearly before us that I am sure we may draw many useful lessons and suggestive hints from them. In conclusion I will briefly recapitulate some of these hints. That which I have especially endeavoured to impress upon my brother students this evening is, that in addition to the ordinary architectural curriculum there must be a systematic and continuous study of buildings that are worthy, both ancient and modern. We must live in an atmosphere of art, breathe it in at the very pores of our skin, as the phrase goes, that it may act upon our own mental soil and render it productive. This fertilisation will be immensely stimulated if, to continue the figure, we plough up the ground with hard thought. "Hard thought," this is one of the great secrets of good architecture—hard thought not only in the problems submitted to us for solution, but in our study of examples. Without such thought we shall sink into mere copyists or adapters of a few stock-in-trade types, having no affinity to the thought of the time or the purpose of the building; in other words, our art will cease to live and grow. I have also urged upon you the importance of laying a good foundation in a practical knowledge of the art of construction and the right use of materials.

This is the only solid, reliable basis for our art. Without such knowledge the keenest appreciation of the beautiful may be only thrown away. At the very best it is for ever fretting against the limitations and restrictions with which it finds itself encompassed. But if the practical, scientific foundation is well and truly laid, how great, how delightful, the field that opens up before the artist. His very fetters become his servants. The goad of the task-master becomes in his hand a tool for the accomplishment of all, and more than all, that his eye had conceived or his fancy dreamed of.

Let our ultimate ideal be the realisation of those moral principles which are the dignity and power of architecture as they are of life—viz. simplicity and self-restraint, sincerity and directness of purpose. Without these we cannot but fail; with these we may accomplish something worthy of our art, and leave behind us work that shall be honourably characteristic of our time.

Mr. A. N. PRENTICE read the following:—

Criticism of the Works Submitted for the Prizes and Studentships, 1904-5.

This year the duty has fallen to me to review the designs and drawings submitted for the prizes and studentships offered by the Institute. I approach the subject

deeply sensible of the honour of being invited to perform this responsible task, and I trust that the students will accept in good part the criticism of one who in former years entered the lists and wrestled like themselves for the various prizes, and who is not forgetful of the patient hours of labour and of the sacrifices necessary to produce a drawing or design such as it is now my privilege to review. In common with many of our members, I have always looked forward with the greatest of pleasure to viewing these annual exhibitions, and the Institute is to be congratulated on the successful manner in which the drawings are displayed in the Alpine Club. The room is well lit and every drawing can be seen to advantage—so different from the old days when the drawings were huddled together in a back room in Conduit Street.

Generally speaking the standard of excellence is well maintained, and I am glad to note that the prizes are competed for in increasing numbers; although it is somewhat surprising, considering the large number of architectural students in this country, that such a very small proportion come forward. Take the Owen Jones Prize, for instance, only three gentlemen have responded. I hardly think students appreciate the vast amount of good these studentships do for them; to many it has been one of the stepping-stones of their lives. In my criticism I propose to deal first with the drawings and studies of old work, and, secondly, with the designs—the ultimate end and aim of all these studies. I have always considered that a facility to draw well is the first makings of a great architect. Did not Michel Angelo impress on his pupils the importance of continually drawing? I know good drawing is not deemed of any great importance amongst some architects, but a visit to the gallery of the Alpine Club is sufficient testimony that our students think otherwise.

The Pugin Studentship.

On looking at the Pugin drawings I am glad to see that this time-honoured prize is again keenly competed for. The medal is awarded to Mr. E. Garratt for a remarkable set of measured drawings, all executed in pencil to a large scale. The subjects are particularly well chosen, an important factor in influencing the award. Such examples as the Beauchamp chantry, Tewkesbury Abbey; the old town hall, Cirencester; the Wakeham tomb, Tewkesbury; and the south porch of Gloucester Cathedral afford ample scope for the draughtsman's skill. The drawings, however, suggest a slight want of sympathy for the ancient works they are intended to represent. One might almost imagine that they were renderings of recent buildings, or otherwise the subjects must be exceedingly well preserved. Such subjects should be treated lovingly, with some indications of the hand of time. Mr. Garratt's display of full sizes is meagre. He also gives very few sketches, but his drawing of St. Chad's pulpit is an admirable piece of freehand work.

Mr. H. A. Dalrymple receives an honourable mention for his five strainers: his best and most effective exhibit represents the details and mouldings on the west doorway, Ely Cathedral, drawn to large scale, curiously mixed with carvings of the Grinling Gibbons order from Cambridge Colleges, and a spirited wash drawing of carving from the Percy shrine. On the other hand, his measured work is rather scrappy: a more effective subject than the Bishop Longland's chantry might have been found.

Mr. Barker's set is in many ways the most interesting submitted for this competition, and more of the type that has carried off the prize in former years. Mr. Barker has a high artistic sense, and his sketches in pencil, wash and colour are delightfully rendered. The drawing of Gloucester Tower recalls some of the late G. E. Street's handiwork. The pen-and-ink drawings of Pershore Abbey and the interior of the lady chapel, Gloucester, might have been omitted; the vaulting in the latter appears out of drawing—a fault which might alone affect his chance. His measured work is confined to a plan, section and elevation of the north porch, Wells Cathedral, all splendidly drawn; but I would not commend the practice of displaying full-size drawings over a small-scale elevation.

Mr. Walter H. Godfrey has three sheets of measured drawings, showing a screen from St. Albans' Abbey Church, bronze gates to Henry VII's chapel, a tomb and a number of sketch-book studies of picturesque bits. The best and most effective are two views of Haddon Hall, one of the courtyard, and the other an unusual view from underneath the terrace.

Mr. Leslie Wilkinson might perhaps have chosen a better subject for measuring than the rather squat vestibule

of a chapter-house. He also contributes some very interesting drawings from Stamford, notably the decoration from the roof of St. John's Church. His best sketch shows the spire of St. Mary's, Stamford.

Mr. Frank Dyer is to be commended for his splendid drawing of the arcading in the lady chapel, Ely Cathedral, executed on the spot in pencil to a scale of 3 inches to the foot. He also exhibits a large number of pencil and pen-and-ink sketches marred by hatching—for instance, the front of St. Mary's, Beverley.

Silver Medal and Ten Guineas.

It is extremely gratifying that the silver medal with its modest award should be so keenly sought after by our students; as many as seventeen sets have been submitted. What an enormous amount of labour these drawings represent.

We have almost complete records of Haddon Hall, Greenwich Hospital and Somerset House. It would be hard to find anything finer in this country than those three buildings.

After a careful examination of the drawings and portfolios there can be little doubt that the committee have given a just award. I should like to impress on the students that while I am glad to see so many recognise the importance of measuring old work, the artistic rendering of an important subject will by no means assure them the prize. I would also impress on students the essential importance of a methodical method of measuring up the buildings they have selected. Year after year the committee (who give very careful consideration to the original surveys) are horrified, I am told, to see the scrappy, haphazard and unconvincing methods adopted by many of the competitors; and in awarding the prize the committee are largely guided by the surveys which indicate the most careful and thorough investigation and study of the buildings.

The Council have awarded the silver medal and ten guineas to Mr. Edward G. Wylie, of Glasgow, for his drawings of Haddon Hall, Derbyshire, excellently rendered and worthy of the subject. The plan is carefully figured and diagonal dimensions recorded. It would have been interesting if the author had given us the first-floor plan as well. The sheet of brass fire-dogs and hinges make a very effective drawing, and other sheets of full sizes represent internal screens and panelling; but details of the external stonework would have been more valuable to compare with the one-eighth-inch scale drawings.

An honourable mention is awarded to Mr. W. Harold Hillier for a huge diagram of the Embankment front of Somerset House, boldly drawn, in a rather hard manner. Some distinction should have been shown between the terrace elevation and that of the main façade. The plan shows no internal figure dimensions. "Ell" can draw full-size details in a strong and effective manner, but there is no attempt to analyse the construction of the wood cornices and the method of finishing the lead gutters. The elevations are well drawn, but marred by the heavy colouring.

Not so well drawn, perhaps, is the set "1903" of Greenwich Hospital, showing elevations of the river front, quadrangle, details of doors to $\frac{1}{4}$ -inch scale, a sheet of tiny block plans, and a few scattered full sizes of unimportant details. Why not have given a large section of the main cornice, frieze, and architrave? The construction of a cornice 3 feet $2\frac{1}{2}$ inches deep is worth analysing.

Mr. Jackson's set of the Pazzi Chapel, Florence, is also awarded an honourable mention, and is charmingly rendered in brown ink, contrasting well with the sectional parts, which are tinted in a grey body colour. The splendid large drawing of the capitals in brush outline is quite a new departure, but the same capitals drawn to a small scale are rather weak.

"Culdee" shows a fine set of drawings of Dunblane Cathedral, and "Clyde" gives us another ecclesiastical building from Scotland; his sheet of full sizes would puzzle any builder's foreman. Time will not allow to mention all the sets.

The Owen Jones Studentship.

Three men compete this year for the Owen Jones studentship, founded for the study of ornament and coloured decoration. Mr. H. Morley, who receives the award, has profited by Mr. Gibson's advice to students last year. He has evidently been back to Italy, and has concentrated his energies on a charming rendering of the vestibule ceilings of the Palazzo Imperiale, Genoa, dating about the year 1560. His figurework displays great delicacy of drawing combined with a charming sense of

colour—a rare gift. Without doubt Italy is the fountain-head of colour decoration; most of the few good examples in this country have been done by Italians. In the seventeenth century Verrio painted ceilings and frescoes in a number of our country houses, but we have little to compare with the finest work in Italy. Had Henry VIII. been able to induce the Pope to permit Raphael to come to England things might have been otherwise, and the influence of Holbein on our subsequent architecture and decoration would not have been so noticeable.

Mr. Beattie Brown and Mr. McLachlan have also been far afield, and both show studies from Spain and Italy. The latter has practically sent in the same set as last year, but his rendering of the colour of the mosaics in the Capella Palatina, Palermo, is rather thin and not convincing. On the other hand, nothing could be more beautiful than the exquisite study of the Mirhab of the Mosque at Cordova, with its glass mosaics and inlay of precious stones.

Mr. Beattie Brown is not so happy in his example of a Spanishreja or screen; better examples are to be found in the Peninsula. This competitor is very ambitious, and has made a bold attempt to depict the elaborate façade of Santa Maria Novella, Florence. Mr. Brown will no doubt do better another year. Emerald green seems to be a favourite colour with students at present; and why use ultramarine to represent the blue in Italian mosaics? A mixture of Prussian blue and light red would, I think, be found to give better results.

Mr. McLachlan's design for a lady chapel suggests painted decoration rather more than mosaic; his blue is much too thin, but his decorative arrangement of figure-work is excellent.

The Arthur Cates Prize.

Two competitors have come forward for this prize, and Mr. Winton Newman is an easy first. The measured set of the south-east angle of the Cloisters, Westminster Abbey, deserves the highest praise. Indeed, as a draughtsman and designer, Mr. Newman ranks with the best men in the room. His design for a picture gallery is well conceived and the projecting arched window is an original idea.

Mr. Vincent Hooper also shows some capable measured work, and his tinted perspectives are quite as good as Mr. Newman's. He also submits a quaint design for a seaside residence, but I think his clients would benefit by the introduction of a hollow wall and an extra door to the dining-room for service purposes. A house of this class should have a morning-room wider than 10 feet.

Soane Medallion.

Having finished with the drawings, we will now turn to the second part of our subject, viz. the designs. What can be more delightful than to be untrammelled by cost in working out one's idea on paper? The pleasure of indulging in one's extravagances and fancies must be very pleasing. Do not restrain yourselves if you want to win the prize; put in all you know. An unsuccessful competitor sending in for the first time for the Soane Medallion will probably be impressed at the display of the prizewinner, but it will be an incentive to him to higher ideals next time. Therefore, design in the grand manner, but, as a word of warning and as a matter of the greatest importance, try to make your building represent what it is intended for. A Roman bath can never be mistaken for an hotel lounge, nor a warehouse for a royal palace. Symmetry of design should be aimed at to get a dignified effect; avoid equal divisions of floors and string-courses; and, finally, start with the plan before beginning your elevations. The designs this year for the Soane Medallion are of an exceptionally high order. A design for a royal palace is a very good subject.

Mr. S. Herbert Maw is placed first with a well-studied plan laid out in a sumptuous manner. One can hardly conceive the details of a plan being carried to a higher perfection, and the author has obviously made a special study of the requirements of a royal palace. He has a big grasp of his subject, and the twin staircases are laid out in a large style, with central groups of sculpture. The geometrical elevations are more pleasing than the perspective view, and the corner pavilions terminate abruptly in heavy square masonry, suggestive of a want of funds. Altogether this admirably drawn set deserves the prize.

Mr. Pickering, who receives an hon. mention, is not so happy in his plan with a rather cramped inner court. His elevation is better than the prizewinner's, in that it is more dignified and in better proportion, the two upper storeys

being treated as one. Why does "Concrete" not turn his principal façade to the river? His plan is left to the imagination of the spectator; the rooms are not named, after the manner of the Ecole des Beaux-Arts. "Nil Desperandum" should study more the use of the brush in tinting his elevations. "Roy" has evidently put off starting the competition till too late. His scheme is unfinished, but his design has a certain grandeur of treatment. The finish of the first-floor window heads is ugly. "Vive le Roi" is wanting in the qualities of style and distinction. "Omar's" design has certainly the air of a royal palace, picturesquely grouped though symmetrical. He shows a central court of ornament, flanked by two courts of utility. The perspective is wildly drawn and the sculpture work highly grotesque. The $\frac{1}{2}$ -inch drawing shows a mixture of Greek and Roman detail of his own invention. Mr. Gordon's elevations are the best submitted. His east elevation section and west elevation have a certain quality of style and elegance that is very pleasing. Mr. Gordon should have a great future before him. The indication of a plain terrace as a contrast to the façade shows he has studied architectural effect, but his staircases are rather pushed away in a corner. "Q.E.D." and "H.M. in Circle" have also good elevations and plans.

Tite Prize.

Mr. Robert Atkinson, who receives the award, gives us an architectural fancy of great merit inspired from a study of an ancient thermæ, Roman sculpture, Michel Angelo decorations and marble pillars of emerald-green. Nature cannot produce columns like these. The whole is, however, a splendid example of modern draughtsmanship. Mr. Horsnell receives a certificate of honour and 5*l.*; the happy effect of the red-tinted columns arrests attention, otherwise his set might be easily passed over. Mr. C. L. Wright has gained an honourable mention for his academic treatment and sensible plan, in which the staircase is made subservient to the whole. His elevations suggest a study of the waiting-hall at Euston station, one of the finest proportioned rooms in London. "Dombey," before starting the competition, has evidently made a tour of some of the recent London productions furnished by some well-known furnishing firms. "Atrium's" perspective is of the shaky order; he has a charming suggestion for a fountain in the centre of his lounge. "Bathon" has taken much trouble and infinite pains over his sections and plans, charmingly shown in a delicate pencil perspective. The plan does not read distinctly enough, owing to the black tinting of the floor pattern. The author of the device "Anchor" should study sciography for the proper rendering of interior sections in colour. "Oracle" is a frank attempt at a modern rendering of the subject; his lounge is top-lit by a series of circles and oblongs. The design is boldly treated, but the colour effect is too heavy, and the inky tone of the sections tends to spoil the decorations. "Roma's" design suggests a grand corridor to a large modern hotel, but the plan is like a Roman basilica.

The Grissell Gold Medal.

Mr. James A. M. Hunter gains the Grissell gold medal with a design somewhat wanting in elegance and lightness. The angle pavilions shown in the perspective would look equally well in rough-cast; at least they suggest more that treatment than the boiler-plate construction indicated on the scale drawings. Mr. Hunter, however, deserves the award; his details are carefully worked out. It must be extremely difficult when approaching a subject of this sort to banish stone architectural forms from the mind. The beauty of iron construction lies in the lightness of its treatment; some successful attempts have been attained in this way in Paris, notably, the hall of the Grand Palais, erected for the picture exhibition in 1900. The design under motto "Irony of Fate" suggests the ironclad type of winter garden, and looks as if it were designed with a view to withstand a siege.

Essay.

I will conclude with a short reference to the Essay. In many ways this should be a memorable year in the history of this award, but principally because the prize has been carried off by Miss Ethel Charles, one of the two lady Associates of the R.I.B.A. The subject set was the "Development of Architectural Art from Structural Requirements and Nature of Materials," a most comprehensive title.

As many as fourteen competitors responded to the occasion. Last year only eight competed, when no work was considered of sufficient merit to obtain the award. I

have not had time to read the essays, but they must have been of unusual excellence this year, as eight competitors have received honourable mentions and awards.

I have now finished my review, and hope that those students whose drawings I have omitted to criticise will not imagine that their works have been passed over or their efforts depreciated. It is my desire to give a word of encouragement to all. May the spirit of enthusiasm not depart from our young men, but may they press on to further achievements. Rome was not built in a day; success will follow disappointment; and seldom an architect comes to fame without experiencing somewhat of the bitter cup of misfortune.

On the motion of Professor Beresford Pite seconded by Professor W. R. Lethaby, a vote of thanks was unanimously accorded to the President for his address and to Mr. Prentice for his review of the work in the competitions.

The President distributed the medals and prizes to the successful competitors, the list having already appeared in *The Architect*.

BYZANTINE PLAN-FORMS.*

(Concluded from last week.)

Radial.

THE Pantheon of Rome may be taken as a convenient starting-point. The structure consists of a great spherical dome set on a circular drum, and the arrangements for supporting the weight of the dome and abutting its thrust contained the germs of many principles which were afterwards developed by the Byzantines. The wall of the drum is of great thickness, in order to oppose its depth against the spreading of the dome; but the weight and thrust are concentrated at regular intervals, so that the structure of the drum is not continuous, but grouped into piers and connecting walls, giving a series of recesses between the piers. The wall of the drum is carried up considerably above the springing-level, so that it gives abutment to the upper part of the dome and secures stability at the springing by its vertical weight. The church of St. George at Salonica offers a Byzantine instance which in many respects is remarkably similar in treatment.

The compound wall of the Pantheon represents an intermediate phase between the simple wall of the circular cella and the later development of aisles, and a further link is furnished in the so-called Temple of Minerva Medica. Here the articulation of the drum-wall into voids and solids is more perfectly attained, the sides of the decagonal plan being deeply recessed into apsidal chambers or exedrae. Above this lower stage a decagonal drum is raised, pierced with clerestory windows and strengthened with buttresses, which are built up from the piers between the exedrae. The dome springs above the arches of the clerestory, and the drum-wall is carried up externally.

In this instance the semicircular chambers are separate from one another, and the next step was to connect them together by openings through the bases of the buttresses, thus forming abutment-aisles similar to those which had already been developed in the basilican plan. This is virtually effected in S. Vitale at Ravenna, where the plan-form of Minerva Medica is repeated octagonally and surrounded by an aisle, the exedrae being converted into arcades, so as to open aisles and octagon into one area. The aisles are of two storeys in height, the upper storey forming the women's gallery, and they rise to the base of the central dome. Buttressing arches spring radially from the angles of the inner octagon across aisles and galleries at the levels of their vaulting.

But it is necessary to differentiate between the thrust of the dome (which requires continuous abutment) and the thrust of the arcaded octagon (which requires abutment only at its angles). The function of the aisles in S. Vitale is to sustain the outward pressure of the eight arches which support the weight of the dome, and to give rigidity to its base. But the actual thrust of the dome is met by the same method as was used in the Pantheon, *i.e.* by the carrying up of the drum-wall above the springing, thus absorbing the thrust by vertical weight instead of by horizontal abutment. This is especially clearly shown in S. Vitale, for the springing of the dome is stilted up to the

* A paper by Mr. E. F. Reynolds read at the meeting of the Architectural Association on Friday, January 27.

arch-heads of the windows in its base, and the lower vertical portion rises clear from the surrounding aisles, and receives no assistance from them in the way of abutment.

The internal transition from the central octagon to the circular plan of the dome is managed by the introduction of slight squinch-arches over the angles, thus producing a sixteen-sided figure, which easily emerges into the required circle. The eastern side of the octagon differs from the other sides, for the gallery is omitted and the main arch opens to a square bema, beyond which is placed the ritual apse.

A somewhat similar design is the church of S.S. Sergius and Bacchus at Constantinople, which was built at about the same time as S. Vitale, and only a few years before the erection of S. Sophia. It is of an interest far greater than would be justified by its scale, for it is now almost the only representative of all the churches which were built in Constantinople before S. Sophia. It is still well preserved, and it is not difficult to trace the influence which it exercised on the apsidal design of the greater church.

The central dome is again represented on the ground plan by an octagon, but the eight sides are not treated alike. The diagonal sides are still curved into arcaded exedrae, but the others are straight and set back to the outer faces of the piers. This inner figure is surrounded by an abutment aisle of two heights, and its arcades open to the central area, as in S. Vitale. The alternating treatment of the sides of the octagon is full of interest and beauty, and it allows of the introduction of the open arch to the bema in a way that is more satisfactory than at S. Vitale. The dome rises immediately above the main arches, and its external wall is carried up in the usual way to give abutment weight to the thrust of the dome; but, as an additional precaution, buttresses are built up from the piers of the octagon, recalling the arrangement of Medica Minerva.

The method of fitting the dome on its octagonal base is unusual, for the necessary modification occurs in the dome itself, and not in the octagon beneath it. The plan of the dome at the springing is not circular, but is formed by a sixteen-sided figure. Eight of the sides are continued up from the faces of the octagon below, and the eight intermediate sides are hollowed back to the angles of the octagon, so as to avoid overhanging. The plan thus produced at the springing gradually merges into a spherical form as the dome rises. The surfaces are so freely treated that it is difficult to describe them clearly, and they can be better studied in the measured drawings. It may be noticed that the arches which pass over the aisles and sustain the central octagon are not set radially, but are grouped in pairs on the four principal sides. The irregular shapes of the aisles are covered with continuous barrel-vaults, which are most ingeniously adapted to the variations of span.

Returning again to the plan of S. Sophia, it is at once evident that the elaboration of the apses is directly derived from such a design as the church of St. Sergius. There is the same alternation of curved and rectangular forms, the arrangement of arcading in two heights, a similar construction of abutment aisles, and S. Sophia has more than once been described as the two halves of St. Sergius separated by a central square.

But, in adapting the forms of St. Sergius to the apses of S. Sophia, several alterations were made. Firstly, the three bays are disposed around a semicircle, so that no modification of plan is necessary to pass upwards to the semi-dome. Secondly, the arches of the gallery-arcades do not intersect the semi-domes of the exedrae but are placed below them. Thirdly, the semi-domes of the apses are not placed above the arch-heads of the three bays, but spring from the same level, and are interpenetrated by them. The reason of this last modification lies in the very different scale of the two churches. St. Sergius is a comparatively small building, and the abutment of its dome was sufficiently secured by the weight of wall carried above the springing and by the buttresses applied to that wall; but the apses of S. Sophia are tremendous constructions of 103-feet diameter, and the same methods would have been a clumsy expedient on so great a scale. The interpenetration with the lesser semi-domes and barrel-vault of the three bays gives efficient abutment to the great semi-domes at the critical point of their curvature, and, furthermore, reduces their actual weight. This ingenious distribution of thrust is typical of the whole design of the domes and vaults, and the thrust of the main dome itself is expended through the great semi-domes, the lesser semi-domes, and through the vaults of the aisles to the outer walls. The constructive genius of Byzantine design may

well be said to have attained its highest expression in the engineering of this series.

The two essential parts which make up the main scheme of S. Sophia have thus been briefly traced—the central square domed compartment derived from the basilican plan and the two compound apses derived from the radial type of plan—and it remains to speak of the adjustments necessary to their combination.

The central square is covered with a symmetrical design of dome and pendentives, and it has been shown that the natural plan-form resulting from such an arrangement is the Greek cross, the arms representing the abutment of the four arches which support the superstructure. In S. Sophia the arms of the cross are developed to the north and south by the great buttresses which pass over the aisles and sustain the east and west arches of the central square; but the completion of the figure by similar extensions to the east and west is rendered impossible, owing to the application of the apses with their deeply-curved exedrae. Neither was it possible to depend on these compound apses for the abutment of the north and south arches, for their derivation from radial structures rendered them unsuitable to withstand such great linear pressure. Hence arose the necessity of mainly absorbing the thrust of the north and south arches within the central square itself, and this was effected by the insertion of an inner arch on each of these two sides. These inserted arches carry the main weight of the dome above, while the original square is still recognised by breaks of 3 feet which, to some degree, are decorative rather than constructional. The side of the square measures 103 English feet, the span of the inserted arch is 74 feet, and the simultaneous reduction of opening and increase of pier secured the north and south substructure of the dome without any extension of abutment beyond the area of the central square. It is probable that a certain amount of thrust from the north and south arches is taken by the apses, for the arch-heads of the exedrae are at the proper height for such service, and their inclination on plan is not excessive, but it would be difficult to estimate the actual proportion of such thrust, and especially after the centuries of earthquake which the building has endured.

Thus S. Sophia gathers into a single design those basilican and radial principles whose development I have attempted to follow, not perhaps with much archæological accuracy, but rather by watching the evolution of progressive forms. But there is far more in the design of S. Sophia than can be accounted for by such a sequence. It may be possible to point to the source of all its various parts and yet remain impossible to conceive how they were combined with such masterly perfection. It may be that closer links might have been furnished by churches which are now destroyed and unknown, but the wonder and delight of the Byzantines themselves seem to mark its conception as perhaps the greatest of those rare miracles which from time to time have crowned the finest periods of art. Such miracles can only arise from the gradual preparation of antecedent ages, the full devotion of a national enthusiasm and the happy chance of a genius such as Isidorus, who could crystallise the saturated aspirations around him in a single creative effort. It may seem that I have dealt with the anatomical forms of the brick construction rather than its fair garment of marble and mosaic, but the one is inseparable from the other. There is no intrinsic beauty in the golden splendour of the mosaics, but they derive a higher quality from the curving domes and vaults which they adorn. The marble incrustation has a delicacy of its own, yet adds only a grace to the power and grandeur of the walls. Byzantine building forms themselves are full of inherent beauty, and whether they bear a wealth of gleaming colour or whether left in white purity, they are but the fulfilment of the same Byzantine art.

A vote of thanks, proposed by Mr. R. PHENÉ SPIERS and seconded by Professor LETHABY, was unanimously accorded to the authors of the two papers. Numerous drawings and photographs of Byzantine work were shown on the walls of the room, the collection being closely studied before the company dispersed.

Messrs. Archer & Walter Reid, architects, Johannesburg, have admitted Mr. Hubert S. East as a partner. Mr. East, who has built up a successful practice in Cape Town during the past two years, was associated in partnership with the late J. T. Wimperis.

OUR CHAPTER-HOUSES.

UNDER the above title Mr. E. W. Harvey Piper, Hon. Mem. S.A., of London, delivered a lecture, illustrated by nearly 120 lantern views, before the Camera Club of Southampton last week. The president, Mr. William Burrough Hill, F.S.I., occupied the chair, and there was a large attendance of members and visitors.

The lecturer said he proposed to bring before his audience some flowers of Mediæval masonry, which would be traced in development from bud to blossom with a consideration as to whether or no substantial fruit remained to the present day. To change the figure, he should treat upon some frozen music out of which the enthusiastic student might, as the varied scenes passed before his eyes, draw some of the harmonies of other days—symphonies of proportion, of symmetry and of form, grace notes of fenestration and carving, the melodies whereof when awakened by the echoes of historic association would, he hoped, arouse latent chords in the listener's mind and captivate his heart and imagination. Before proceeding to the illustrated portion of his address, which was delivered entirely without notes or memoranda, Mr. Harvey Piper explained the origin and development of the chapter-houses which as architectural relics form so precious a legacy from the past, pointing out that these assembly rooms were equally essential features in the Middle Ages of every large monastic, collegiate and secular establishment. They were the meeting-places for assemblies of religious orders and for the diocesan synods held in May and December, and also for election of officers and the periodical reading of the rules. The chapter-house was, in fact, a glorified vestry-room, but its uses as a library, as a place for the flagellation of disciplined monks, for washing the feet of twelve beggars each Maundy Thursday, and for reading the first portion of the burial service over deceased brethren were pictured in detail. Where cloisters existed the chapter-house, with but few exceptions, invariably opened off the east walk, a vestibule intervening in many cases. The houses were of two forms—rectangular (regular bricks in shape), or polygonal (like a bee's cell in a honeycomb). All the earlier chapter-houses built in England (and, with six exceptions, every one of those attached to monastic institutions) were rectangular, book-shaped on plan, and were usually divided into two or three bays. Except in Cistercian houses there were no internal columns, and of course no galleries, and the roofs were generally vaulted in stone, oak panelling being substituted in such late examples as Exeter and Canterbury. Frequently the east end was canted off into an apse. As the chapter-house in conventual establishments was extended from the east side of the cloister, parallel with the south wall of the south transept of the abbey church, the rectangular plan was so convenient that only in half a dozen monasteries was a polygonal outline adopted for these houses. The exceptions were the Benedictine houses of Belvoir, Evesham, Westminster and Worcester, and the Cistercian establishments of Abbey Dore and Margam. The rectangular houses, secular and monastic, were in the vast majority, and included those at Bayham, Beaulieu, Bolton, Bristol, Buildwas, Bury St. Edmunds, Canterbury, Castle Acre, Chester, Crowland, Exeter, Fountains, Furness, Gloucester, Hayles, Hexham, Kirkstall, Laycock, Lewes, Lindsfarne, Llandaff, Netley, Norwich, Old Cleeve, Reading, Rochester, St. Albans, St. Davids, Tewkesbury, Tintern and Wenlock. After 1100 the secular clergy began experiments in building many-sided houses—a form which evolved far more beautiful edifices, and one which was never adopted either in France, Germany, Spain, Italy, or the Low Countries. Even in Great Britain only six-and-twenty houses were planned polygonally, all but two (Elgin and Inchcolm) being in England. Of these four-and-twenty had a central pillar to carry the stone vault, the two latest and finest pair of houses, those of Southwell and York, being planned, like modern theatres, without any internal obstruction to the view. Putting a lantern slide of a typical rectangular plan of a monastic church, with its cloister and chapter-house in orthodox relative position, on the screen, Mr. Harvey Piper proceeded to illustrate and describe in chronological order, and using as far as possible colloquial terms, about a dozen houses of this type, beginning with the Benedictine example at Gloucester, a sturdy Mid-Norman room, with groined vault, built in 1085 by Abbot Serlo, and to which an eastern bay was added in the Perpendicular style by Hanley, the last but one of the abbots before the Dissolution. Its use as the seat of the early councils and of the

Parliament of Richard II. were alluded to, and the lecturer passed on to the rather later house at the Benedictine establishment at Durham, built by Bishop Galfrid Rufus about 1090. In scathing terms the lecturer referred to that ignorant vandal and self-styled architect, James Wyatt, who destroyed by explosives the beautiful eastern apse, which he opined was too dangerous to be allowed to remain, and recorded how the stately work had recently been restored, under Mr. Hodgson Fowler, as nearly as possible, as a memorial to the late Dr. Lightfoot, the scholarly commentator. Winchester was next visited, the features of the roofless Transitional Norman remains (this was built by Bishop William Gifford, of St. Mary Overie, c. 1100, and desecrated by Bishop Richard Horne, an ill-informed and grasping prelate of the days of Elizabeth) so well known to the club members, being pointed out; and then came Bristol, with its wonderful house, the work of Robert Fitzhardinge, and the finest conception of Late Norman work, according to the lecturer, in this class of edifice. On this followed Ripon, stern and stately, with its story of the men who broke sanctuary in 1458, and again a local instance in old Beaulieu, the first of a trio of Cistercian houses put upon the screen. The lecturer told again the story of King John and the abbots, and then came still closer home to poverty-stricken Netley, whose establishment at the period of the Dissolution was twelve brethren only, and whose only literary treasure consisted of one small volume, the "Orations" of Cicero. Here it was pointed out how the prohibition of the introduction of the human and animal figure into the sculpture of the Cistercians had resulted in the use of exquisite geometrical designs, and how the very repression had resulted in the extension and refinement of the art. A plan and conjectural restoration of this chapter-house, reproduced from drawings given in the sumptuous monograph by the late George Guillaume, a well-known and highly-respected Southampton architect of the last generation, were followed by several recent slides of the actual ruins, taken by Mr. S. Guy Kimber, the hon. secretary of the Southampton Camera Club, and it was pointed out that the windows of this house were never glazed, but protected by latticework bolted to the jambs, a channel being cut in the sills of the eastern lancet lights for the escape of the rain water which found its way through. The far more ornate house at the sister Cistercian Furness Abbey and the Oxford and Chester houses—the two latter so alike in treatment, although erected the one for Augustinian and the other for Benedictine monks—were all visited in turn, the connection of Kingsley with the interesting library of the latter being noted. Then came Exeter, with its splendid library and specimens of Jacobean carving, the author letting fall a hint that during his visit last summer this beautiful house by Bishop Bruere, the Crusader, looked badly in need of renovation and even actual cleansing. At Rochester an admirable photograph by E. R. Bull, of the half-closed door from the south transept to the chapter-house was greeted with hearty applause, the lecturer remarking that the portal, by Bishop Hamo de Hythe, c. 1330, was the only feature of the house worthy of study. The graceful figures on either side of the door personifying the Jewish Dispensation and the Christian Church were shown as separate slides, the latter being illustrated first with the bearded face and with the head ignorantly added seventy years ago to the decapitated and obviously female figure by Lewis Cottingham, and then with the beautiful lady's head by which that absurd finish has just been replaced under the direction of Mr. Hodgson Fowler. This section of the lecture was concluded with a series of views of the late fourteenth century Benedictine house of Canterbury, the largest and latest of the rectangularly-planned houses, with its deeply-arcaded side walls, and its rich east-end canopies wrought in Caen stone, the spacious interior being shown in its unrestored state and as recently redecored by Mr. A. O. Hemming. It was, however, in his description of the polygonal houses that the lecturer found his chief theme. First came, in 1100, Worcester, circular within and decagonal without, with its memories of Charles II. and his fortunes; lordly Lincoln, the very largest of these many-sided buildings, restored by the late J. L. Pearson, and in which by an unexpected turn the author drew attention to the evolution of architecture in the nineteenth century, as exemplified by a relic of the Iron Age—a hideous gill stove, placed in the most prominent angle of vestibule and house. Lincoln preceded Beverley Minster, with its lost house, but its elegant stairway on the north side of choir; then came Lichfield, with its perfect double octagon and rich carving of the

days of Dean and Bishop Roger de Wesenham; and so on to Westminster. Mr. Harvey Piper peopled the historic house with its old inhabitants, the pious monks and the turbulent Parliaments, and then showed slides picturing its neglect and abuse after the Reformation as a dusty receptacle of rolls and Exchequer tallies, and since to Gilbert Scott's restoration. All too soon came the next move to Salisbury, where the carved frieze showing quaintly-told stories from Genesis and Exodus was pictured and described. Wells, with its wealth of beauty, followed; then came queenly Southwell, with its marvellous exuberance and variety of naturalistic and grotesque carving, as illustrated from a series of superb photographs by Francis H. Evans; and, lastly, the "king of the chapter-houses"—great York, built as recently as the reign of Edward II. during the episcopate of Archbishop William de Melton. Here the bold canopies with their diverse carvings, the stately double portal, the magnificent arcading, and the unrivalled fourteenth-century grisaille glass in six of the immense windows which fill the room with a cataract of light, were shown to justify the well-known boast written on the wall, "Ut Rosa Flos Florum sic est Domus ista Domorum," and a little-known sonnet by the late Canon Wilton founded on this couplet was quoted. In conclusion, the lecturer asked if these stony flowers which they had traced in two parallel series of development—a scanty bouquet garnered from the rich and lovely parterre of Mediæval architecture and carving—could be said to have blossomed in vain. The assemblies in our chapter-houses had, he argued, been training schools in liberty of speech conjoined with mutual deference and self-respect, which had laid the foundations of our vestries, parish, town and county councils, and in two of them, Gloucester and Westminster, had been cradled the sturdy child which had become the mother of all the Parliaments of the world.

At the close a hearty vote of thanks was accorded to Mr. Harvey Piper, on the motion of the President, and a cordial invitation was given him to come and lecture again before the club.

GENERAL.

Mr. E. C. H. Maidman, architect, Edinburgh, has been successful in a competition for the proposed Moffat Cottage Hospital, which is to cost about 1,000*l.* Forty designs were sent in.

The Aberdeen Artists' Society have started a movement for the institution of a permanent memorial to the late Mr. Brough, A.R.S.A.

The Finance Committee of the York Corporation have had under consideration the question of the taking down of the Castle walls, which was referred to them at a special meeting of the Council on December 12, as one of the proposals for providing employment for those out of work in the city. In their report they express their opinion that, in view of the many interests to be considered, the subject cannot be regarded as a scheme for providing present work for the unemployed.

The Eccles Town Council have accepted the offer of Mr. Councillor Potts (Messrs. Potts, Son & Hennings) to act as honorary architect of the building for the public library of Eccles, towards the provision of which Mr. Andrew Carnegie has promised 7,500*l.*

The Bishop Ridding Memorial Committee have resolved "that Mr. Pomeroy be requested to submit a design of a kneeling figure, in conjunction with Mr. Caröe, as architect, and to state the approximate cost and time of carrying out the work." It is intended to erect the memorial in Southwell Cathedral.

The Archbishop of Westminster has given his cordial approval to a proposal to erect in Westminster Cathedral a chapel dedicated to St. Patrick and the Saints of Ireland. The cost is estimated at about 15,000*l.* It is intended, as far as possible, to use Irish materials and employ Irish artists. The chapel will be the second on the Epistle side of the main door, and will adjoin the chapels of SS. Augustine and Gregory and the Saints of England.

Mr. S. Maurice Jones, a Welsh artist, of Carnarvon, is engaged on views of several of "The Homes of Wales," comprising residences of celebrated Welshmen of the past, and has signified his intention to present a number of these to the University College of North Wales, to be put up in the new permanent buildings.

The Trustees of the Public Picture Gallery Fund have purchased a drawing by Samuel Prout of street architecture in the Altstadt of Prague; five water-colour drawings by John Ruskin, as follows:—(1) "Laufenburg on the Rhine"; (2) "La Cascade de la Folie"; (3) "Folkestone Hillside and Church"; (4) "Old Houses at Geneva, on the Rhone Island"; (5) "The Church Tower at Courmayeur"—five lithographs by J. McNeil Whistler, and a portfolio of ten dry-point etchings by Muirhead Bone, and have offered them to the Birmingham Corporation to be placed in the Art Gallery.

The Royal Scottish Academy in Edinburgh on Wednesday elected the following Associates as Academicians:—Mr. E. A. Walton, painter, Edinburgh; Mr. W. Birnie Rhind, sculptor, Edinburgh; Mr. J. Kinross, architect, Edinburgh.

The Whitechapel Art Gallery spring exhibition will illustrate British art between 1840 and 1870, and will remain open for six weeks, from about March 22. The upper gallery will be devoted to the pre-Raphaelites; the ground floor gallery to their contemporaries. A special effort is being made adequately to represent some of the lesser known pre-Raphaelites.

The Improvement Committee of the Sheffield Town Council had under consideration on Monday the proposal that the Corporation shall take over the maintenance of the Queen Victoria Memorial statue after it had been unveiled. It was decided that it would be desirable to have the statue railed round.

Eight Windows for the lady chapel of Liverpool Cathedral have been presented by representatives of some of the leading families of Liverpool. A finished design of the lady chapel has been approved of by the committee, and the concreting of the foundations to the towers is being proceeded with as rapidly as possible.

Mr. Carnegie has informed the ex-mayor of St. Pancras, where the Free Libraries Act has been adopted, that he will do for St. Pancras what he has promised to do for Islington—that is to say, provide the amount needed to erect a central and four branch library buildings, 40,000*l.* sterling, on condition that the penny rate is levied and free sites given for the libraries.

The Provost of Oriel has been appointed the representative of Oxford University at the International Congress of Archæologists to be held at Athens in April. Mr. Charles J. Holmes, Brasenose College, Slade Professor of Fine Art, has been elected a member of the Board of Architectural Education.

The "City Press" has published a pamphlet entitled "The Building Act Amendment Bill: why it should be opposed by Citizens and the Ratepayers." It is a reprint of a series of articles which have appeared in that journal.

A Statue of Puvis de Chavannes, the painter, is to be placed in the small square of the Place Pigalle, Paris, opposite the house in which he occupied a studio. The sculptor is M. Rodin.

The Cardiff Corporation have resolved on the erection of the first section of the art gallery. The estimated cost is 25,000*l.*

The Chester-le-Street Rural District Council have received applications from the undermentioned for the post of architect for the proposed small-pox hospital:—J. G. & R. G. Cowe, Chester-le-Street; Messrs. Boyd & Groves, Newcastle; S. Wilkinson, Pelton; H. Miller, Felling; and J. H. Mole, Chester-le-Street. Messrs. Boyd & Groves, of Newcastle, were appointed.

A New School is to be erected at Chippenham for the education authority to accommodate 360 children. The total cost must not exceed 4,000*l.*, exclusive of boundary walls. For the plan considered as entitled to first place a premium of 30*l.* will be offered and 20*l.* for the second plan. Plans and specifications must be sent in by March 31.

An Exhibition of Works executed by the students of the School of Industrial Arts, Geneva, will be opened on March 4 or 6 at the City Art Gallery, Leeds.

The Finance Committee of the Lancashire County Council have recommended that the county architect should perform all the work required by the education committee at an increased salary of 300*l.*, and that the salaries of the office staff be increased to a total not exceeding 1,500*l.*

A Paper on "The Lighting of Buildings by Electricity and Incandescent Gas" will be read by Mr. B. R. Tucker at the meeting of the Society of Architects on the 16th inst.

The Architect.

THE WEEK.

MACAULAY once wrote:—"We know no spectacle so ridiculous as the British public in one of her periodicals of morality, when her virtue becomes outrageous." His words are applicable to the discussion by the County Council on Tuesday of the project for the erection of a French exhibition, theatre and other buildings in the Strand. Last week we explained the doubtfulness of such a scheme becoming sufficiently profitable to enable the proprietors to pay 55,000*l.* a year, besides other inevitable expenses. We regarded the matter simply from a surveyor's point of view. But because the title "Paris in London" was somehow conferred on the project the virtue of the County Council became alarmed and the proposal was referred back to the improvements committee for consideration, or, in other words, was rejected for the present, if not forever. The chairman of the improvements committee testified to the honourable intentions of the syndicate, and he pointed out that it would be very difficult to let the land at all if imputations were made against the character of the applicants for it before the object in view in using the land was understood. The French have the knack of adapting themselves and their entertainments to circumstances, and with such controlling power as the law allows to the County Council as well as to local authorities it is as likely a Puritanic decorum would be observed in the venture as independence and indifference to criticism. Many kinds of entertainment are to be found in Paris, each being suited to the peculiarities of the district. In the Strand there would be many reasons to prevent an imitation of the peculiar gaiety which is occasionally to be found at Montmartre. A majority of forty-nine have, however, determined the question, and have testified that according to British tastes colossal buildings with virtue are preferable to those of a limited height, which can be suspected of becoming dangerous to public morals.

Two subjects have been investigated in connection with the plans for the Usher Hall in Edinburgh, viz. lighting and seating. It was ascertained that originally there was 1 square foot of window area to each 861 cubic feet of space; but in the modified plans the proportion was as 1 to 525. The Synod Hall, Edinburgh, has 1 square foot of window to 245 cubic feet of space. The Music Hall has 1 to 304, the McEwan Hall has 1 to 451; both are in Edinburgh. In St. Andrew's Hall, Glasgow, there are 835 cubic feet of space to 1 square foot of window. The special committee of the Town Council, who have considered the subject, say:—"It is not, however, to be too readily conceded that a large measure of window surface is desirable. On the contrary, a well-established principle is that much glass is inimical to good acoustical results. In the Music Hall, with its large windows, at all important afternoon concerts the caterers demand artificial in preference to daylight; and the same desire is expressed elsewhere. In the lower halls of the Carnegie Music Hall building in New York, according to the drawings, there is no trace of windows, which shows that instead of the proposed lower hall being only fit for use as a storage cellar, there is no good reason against its use as intended." As regards seating in the central hall, which is arranged to seat 2,000 auditors, the allowance in the area is 18 inches of width and 2 feet 4 inches depth, and in the gallery the width is the same and the depth 2 feet 8 inches. In the Lyceum Theatre, Edinburgh, the orchestra stalls are 20½ inches in width; pit stalls, 18 inches; dress circle, 20½ inches; amphitheatre stalls, 19 inches; amphitheatre, 17 inches. The depth ranges from 1 foot 9 inches and 2 feet 3 inches

in the pit stalls to 2 feet 10 inches in the dress circle. In the Music Hall the width allowance is 19½ inches centre seats, 19 inches sides and 20 inches gallery. In St. Andrew's Hall, Glasgow, the width is 18 inches in the area and balcony, with the exception of the back row of the balcony, which is 16 inches; and in the City Hall, Glasgow, the width all over is 16½ to 18 inches. In St. George's Hall, Liverpool, and the Town Hall, Birmingham, the width of each seat is 18 inches. In St. James's Hall, London, now about to be demolished, the width is 18 and 19 inches.

FOR nearly half a century the firm of BAIRD & THOMSON has been familiar to the citizens of Glasgow who gave attention to architecture. There were many prominent buildings which were evidence of their skill. Among those of a commercial class were the Clydesdale Bank of Scotland, the British Linen Company's Bank, the offices of the Standard Assurance Company, the Lancashire Insurance Company, the Liverpool, London and Globe Insurance Company, the Scottish Union and National Insurance Company. It is with much regret we have to record the sudden death of Mr. JAMES THOMSON, the principal representative of the firm. Owing to an affection of the heart he passed away rather suddenly on Sunday night. He was a native of Glasgow and was born in 1835. He received his training under the late Mr. JOHN BAIRD and became his partner in 1858. His practice was varied. Among the residences he designed Belmont Castle, Perthshire, the seat of Sir HENRY CAMPBELL-BANNERMAN; Birkwood House, Lesmahagow; Kinnaird House, Stirlingshire; and Gartshore House. He was also architect for the Dumbarton municipal buildings. Mr. JAMES THOMSON was twice elected as president of the Glasgow Institute of Architects. He also served as president of the architectural section of the Philosophical Society.

THE newspapers for some weeks past have been amusing their readers with the "eccentricities" of the late ALFRED PATRICK THOMS, a Scottish judge, whose will was disputed by his nephews. The strongest proof given that he was not in a sound mental condition was his bequeathing property which was estimated to cost 60,000*l.* for the restoration and repair of the cathedral of St. Magnus in Kirkwall. At the present time all that would be available for that purpose would be about 33,000*l.* But eventually a larger sum may be at the disposal of the trustees. Our readers do not need to be informed of the importance of the Orkney cathedral of St. Magnus, of which a part dates from 1137, and in which the original Romanesque treatment was respected by later builders to a degree that was uncommon in Mediæval times. Mr. W. W. ROBINSON, who was long connected with His Majesty's Board of Works, estimated that 69,000*l.* would be required to carry out such a restoration as is desirable. Mr. BLANC, R.S.A., estimated the amount at 67,000*l.* Mr. THOMS's supposition that about 50,000*l.* would be required was enough to suggest that he was able to take a sane view of affairs. The jury thought so, for they were less than half an hour in making up their minds to give a verdict in support of the will. The case is as remarkable as any which are referred to in MILL'S "Liberty." Here was a judge who was able to discharge his duties with satisfaction, but who in private life wished to puzzle people for his own amusement by putting on an antic disposition, and yet because he had the good sense to make provision for upholding one of the noblest buildings of his country he was supposed to have been of unsound mind. Fortunately in England many wealthy men have been allowed to expend still larger sums on restoration without incurring such a risk.

FOREIGN LAWS RESPECTING SMOKE.

IT is a long time since Englishmen who travelled on the Continent began to realise that their country was peculiar on account of its smoky pall. JOHN EVELYN in 1661 wrote his "Fumifugium," and received the special command of CHARLES II. that he should publish it. When the Great Fire of London occurred EVELYN could not help feeling some satisfaction that he had predicted the evil consequences of an excessive use of fuel. After gazing on the flames he recorded in his diary how "the coale and wood and magazines of oyle, rosin, &c., did infinite mischeife, so as the invective which a little before I had dedicated to His Majesty and published, giving warning what might probably be the issue of suffering those shops to be in the City, was look'd on as a prophecy." EVELYN denounced "the hellish and dismal cloud of sea-coal," for as he was a lover of planting he believed that wood was preferable to a mineral substance, but he had the sagacity to perceive that the domestic fireplace was not alone responsible for the evil, for the chimneys of brewers and manufacturers, although they were not numerous in those days, with their "belching sooty jaws do manifestly infect the air more than all the chimneys of London put together." He endeavoured to have a Smoke Abatement Act passed, but without success. It is needless to say that foreigners since EVELYN's time have been also amazed at the difference of the atmosphere east and west of the Channel, and it may have often seemed to them that it would be easy to make English towns as free from soot as those abroad.

If continental cities are unlike London or towns in the manufacturing districts, it has not been owing to the influence of legislation. In that respect, at least, foreigners have been free to act as they pleased. The fantastic forms of the chimneys in several of the Italian towns are evidence that the smoke problem was always a perplexing one to solve, and that architects and builders endeavoured to meet the difficulty. The great fires in Venetian palaces were at one time a surprise to travellers; and it was supposed by some old-world physicians that the inhabitants owing to the heat and smoke lived longer than those of other cities, for many of them attained the age of 120 years. It should be remembered that at one time the drainage of land was neglected and swamps abounded in all parts of Europe. Fires were therefore a necessity.

The general use of wood also caused less smoke to be emitted and of a lighter kind than was possible with coal in England. The invention of the close stove, which was adopted in all parts of the Continent, moreover enabled a more complete combustion of fuel than with the English grate. Prejudices count for much in assessing the value of things, and an Englishman enjoying a pleasing view of his own fireside, and it may be creating pictures in the flames, would never be able to realise the delight which all Germans of a philosophic turn were supposed to find beside their falence stoves. As the old wandering students' song has it—

Beatus ille homo
Qui sedet in sua domo,
Et sedet post fornacem,
Et habet bonam pacem.

The close stove not only may be considered as almost smokeless, but it is economical, for all kinds of rubbish can be consumed in it to increase the heat. We have heard hotel managers assert that the outlay for fuel to warm a single room does not amount with such an appliance to more than a halfpenny or a penny a day. That may be an exaggeration in order to demonstrate the superiority of stoves and to overcome the dislike of English visitors, but the cost of firing with a foreign stove is undoubtedly very low, and contrasts with the sum which has to be paid in a London lodging-house for the daily scuttle of coal. As for factories, the arrangements are fairly alike all over the world, for if

any new system of heating is introduced in one place is sure to be imitated elsewhere.

There could be, therefore, no great advantage in demanding reports from His MAJESTY'S representative in Paris, Berlin, Vienna, Buda-Pesth, Rome, Brussels, The Hague, Berne, Washington, Munich and Coburg respecting the laws enforced in those cities for the regulation, restriction or prevention of the emission of smoke from factories and other business premises, and from private dwellings. None of the cities mentioned is outside the circuit followed by English travellers, and if anything was peculiar, in one of them it would long ago have been discovered by sanitarians.

The reports, it must be allowed, are not of much use in guiding those who are eager to introduce legislative enactments. In Austria, it is said, there is no immediate prospect of a satisfactory solution of the problem. There are general provisions in the sanitary laws respecting the emission of poisonous gases from factories. But apparently they must be harmful to forests and vegetation. In other cases the enactments relate to the injurious quality of smoke, and the factories must not damage in any way churches, schools, hospitals or other public buildings. Smoke as a general nuisance is philosophically disregarded. Bavaria is also without laws for regulating, restricting or preventing the emission of smoke. By the civil code smoke and soot are nuisances which may be made the subject of legal action if material injury is done to a complainant's property. A law was passed in 1903 by which the chimney-sweep must personally satisfy himself of the proper condition of the flue before, and again after, sweeping. According to his report the police can take such action as might be necessary. This is no more than an extension of the system of surveillance to which people on the Continent readily submit. In England sweeps appear to consider all flues are imperfectly constructed.

The Belgians contrive to rival many countries in manufactures; they have a low death-rate and encourage art without any direct law against smoke. But factories must have licenses, which will not be granted unless under certain conditions. Chimneys in boiler factories are to be 45 feet high, in glass factories from 90 feet to 120 feet, in other cases the chimney is to be from 30 to 15 feet higher than any chimney within a hundred yards. Occasionally it is ordered that the fuel must be such as to give as little smoke as possible, which is more than a prevention against poisonous fumes. Although smoke offers such a tempting opportunity for enactments, the French have to content themselves with mere police ordinances, and even these have less power than would be supposed. For instance, in 1854 a law was issued requiring owners of steam-engines to use their smoke or to use fuel which would not produce more smoke than coke or wood. Nobody paid any heed to it, and another issued in 1865 was not more respected. In 1898 the prolonged emission of thick black smoke from industrial establishments was prohibited. Owing to the bad example set by many of the public buildings, there was opposition. It is said there is an increase in the number of manufacturers who comply with the regulations, which, it may be remarked, do not concern private dwelling-houses. The clear air of France cannot therefore be ascribed to the infliction of penalties whenever smoke is observed to come out of a volume from a factory chimney.

If there is any country in the world where legislative enactments might be supposed to attain a desired result it is in Germany, and more especially in Prussia. We can therefore conclude that some other manner of dealing with the subject is practised, when we learn that there are no actual laws enforced in the Empire for the regulation of the emission of smoke. There is a regulation which the permission to erect premises that might cause prejudice, danger or annoyance can be withheld, and smoke might be interpreted as coming under one of the three heads. Indeed, it was announced

more direct law dealing with the emission of smoke has been postponed in the hope that manufacturers would give greater attention to the subject. Care is taken to set an example in State premises to avoid the emission of black, thick and continuous smoke by expert management of the furnaces, carefulness by the firemen and supervision of fuel. There is constant watchfulness, but up to the present the official reports are all opposed to the introduction of any special police regulations. When it is found that experts cannot agree as to what constitutes black, thick or continuous smoke, the difficulty is recognised of furnishing data which would guide police or other inspectors. It is characteristic of Germany that more hope is placed in education than in detectives. In 1902 a course of instruction for firemen was established, and 2,000*l.* is allowed in the year for expenses. The boiler insurance societies have also a staff of instructors who give lessons to firemen and engineers in country districts. Private dwelling-houses do not fall under regulations, and, indeed, little smoke comes from them owing to the use of coal-dust bricks and the system of central heating, for which coke is generally employed. In Hungary smoke-consuming appliances have to be used in large factories. But it is stated that the results are not commensurate with the expense incurred, and it is believed that careful stoking would be as effective as any apparatus yet discovered.

Although Italy can be considered for administrative purposes as a new country, much wisdom has been exercised in the making of enactments. Industry, which means factories, has to be promoted, while it would certainly be killed if such fussiness as prevails in England was allowed to exert any influence. Any industry which is likely to diffuse unhealthy exhalations must be established in the country and at a distance from inhabited houses. With industries which can be carried on in towns all danger to the public health must be avoided. It also happens that electric energy produced by water-power is in favour, and the question of smoke is therefore of little importance.

Holland also has avoided passing special laws about smoke. Projectors of factories and other buildings employing gas or steam have to give notice to the owners and tenants of property, the authorities of hospitals, churches and schools which exist within 220 yards of the proposed buildings. If those people have objections on account of danger, damage to property, trade or health, or nuisance of some serious nature, such as the emission of foul or obnoxious smoke, they can petition the municipality, and if the objections are valid the permission can be refused. As so much attention is given to Dutch houses, it may be well to reprint some of the regulations which are in operation in The Hague relating to the height of chimneys:—

It is enacted that chimney-pipes built from the top of the roof must be raised at least 3 feet 3 inches above the roof; if built on any other part of the roof, they must be raised to a height to be specified by the police; chimneys which are lower than the top of the neighbouring roofs must, at the instance of the Burgomaster or Wethouders (County Council), be heightened or altered, as these authorities shall prescribe; chimney-pipes next to any building which is altered or heightened must, by the owner of such building, be altered or raised 3 feet 3 inches above the gutter of such heightened building, and no chimney may be built or altered without giving previous notice and receiving permission from the police.

In Amsterdam the chimneys are to be 3 feet 3 inches above the top of the building to which they belong, and if required must be raised above the top of the neighbouring buildings.

A Building Act was passed for Saxe-Coburg and Gotha in 1884. If in a building already existing the emission of smoke becomes a nuisance, the police can interfere and have alterations made. But the owner may claim compensation from the complainant for any expense which was incurred. The old grandmotherly

interference is suggested by the edict that "the lighting of fires must be so managed and conducted through chimneys of such height and construction that smoke, soot or sparks may not escape in a manner calculated to cause a nuisance or a danger to the neighbourhood." The Saxon regulations rely mainly on careful stoking and the employment of coal of medium quality. The authorities can enforce the heightening of a factory chimney if deemed necessary. Switzerland is an example of what can be done by wise government. The question of the abatement of smoke has never yet been raised in any of the cantons. Smoke might, it is believed, come under the law for regulating labour in factories. It would be possible in case of nuisance to bring an action in the law courts, when the question would be tried by the judge on its merits. But no record exists of such a proceeding. In Würtemberg there are regulations respecting buildings which state that "business premises may be required to use smoke-consuming appliances should circumstances justify such a request being made."

The United States allows the different States to frame regulations. In Pennsylvania, New York and Illinois there is no general legislation on the subject. In Massachusetts a law was passed in 1902 during a coal strike when a large quantity of English coal was imported which increased the smoke nuisance. But already it is practically a dead letter. In the different towns there are regulations which apply to locomotives and steamships as well as to factories. In Philadelphia an attempt was made to establish a colour scale for the measurement of the degree and darkness of smoke:—

One thickness of grey glass of sufficient capacity to cut off 60 per cent. of the light from a flame having a lighting power of sixteen candles shall be taken as the basis of this scale: two thicknesses of said glass shall be known and designated as No. 1 scale; four thicknesses of the said glass shall be known and designated as No. 2 scale.

It is forbidden, and hereby declared to be unlawful, to suffer or permit the emission or escape of smoke from any or all fires not in motion, or fires banked or in a state of rest, or through any burning or active fire through a stack, flue or chimney less than 50 feet high of a colour greater than No. 1 scale.

It is hereby further ordained that smoke may be suffered or permitted to escape from any puddling, open hearth or forge furnace now erected to a degree of darkness not exceeding No. 2 colour scale through a chimney 50 feet high, and from any puddling, open hearth, forge or other furnace hereafter erected of a degree of darkness not exceeding No. 1 colour scale, with a chimney not less than 150 feet high; but that the emission or escape of smoke of a colour degree of darkness greater than that provided respectively in this section is hereby prohibited and made unlawful.

From what we have said it must be concluded that foreign countries which are supposed to possess always the clearest of skies do not secure that enviable position in towns by means of rigorous laws. English coal differs from anthracite. But nature has provided us with it, and we must accept its defects for the sake of its advantages. There are no doubt many appliances by which the density of smoke can be diminished, and it is right they should be employed wherever it is possible. But a man who will select for a residence a house near a big factory cannot expect to be able to put the factory owners into the dock whenever a few blacks fall in his yard or are blown through one of his windows. Life in towns is only possible by compromises, and so long as we have to employ steam we must put up with smoke. We may therefore expect that one effect of the reports from the Embassies will be to impress the Government with a conviction that vengeance against factory chimneys is not to be encouraged at the present time.

An Exhibition of Fine Art is to be held in Liège. The French jury for architecture will consist of MM. de Baudot, Lalou and Vaudremer, with M. Begard-Fabre, one of the officials of the Ministry of Art.

COTSWOLD COTTAGES.*

EVERYONE knows it is an advantage in the auction room when a painting, an etching, a statuette, or other object can be described as forming the subject of an illustration or a description in a book. The same principle is likely to be exemplified, or at least we hope so, in respect of buildings. The volumes relating to old cottages which Mr. BATSFORD has published, and which, we trust, will develop into a series representative of various parts of the country, will probably act as an inducement to owners for the preservation of the buildings. Those which have appeared are characteristic examples of the English manner of building before education and other influences appeared to compel pretensions in the designing of cottages. The subject is one which has applicability at the present day, for what is the cottage question which gives rise to so much discontent? Is it not either an effort to make the agricultural labourer feel his inferiority, or a striving to run up showy structures which will be attractive on the outside, whatever may be the sacrifice of convenience within, at a cost which will bring little or no loss to the landlord?

Among the hundred plates which appear in the volume on the old cottages in the Cotswold district, we can find no example which seems to have been inspired by either motive. Many of them could not have cost much to erect, but the least among them might be used as a holiday residence by a young artist or amateur without any loss of caste. There is no extravagance on ornamental accessories. But yet all of them have characteristics which are sufficient to make a picture of every plate.

The builders had the advantage of finding excellent building stone within their reach, and the masons were so accustomed to manipulating it that even in dry walling it is difficult to remove a stone from one of the courses. They must often have had to build at a cheap rate and were obliged to use quarry rubbish. The putting in of foundations was sometimes not preceded by any deep foundation. The Cotswold builders were not a race apart and willing to undergo losses in order to produce enduring work. But with all the defects the cottages have stood for two centuries or more, and it is doubtful whether a large percentage of showy buildings erected in our time will be visible at the end of a century. A still greater number of the Cotswold cottages might have existed, but they were demolished through fear that the occupants of them would become a burden on the landowners. The peculiarities of the buildings which give them a claim to be recognised as a distinct class of habitation for humble folk are manifest from the plates and are described in detail by Mr. GUY DAWBER. These qualities are summed up by him as follows:—

Broadly speaking, the recognised Cotswold type belongs to the period between 1580 and 1690. It was a thoroughly common-sense style of building, based on tradition handed down through generations of village craftsmen, and it remained without change for nearly a century. The main bulk of the buildings were without doubt erected by local men, and without any external aid, for we find the same methods adopted, with but slight variations, many miles apart. It was a style that was gradually evolved; at first retaining a few links with the so-called Perpendicular work of the preceding century, but slowly shaking these off, until in the course of some few years it settled down to be the traditional work of the day, the vernacular of building in which the craftsman expressed his idea. . . . It may be thought that these villages and country towns are all of a stereotyped pattern and somewhat monotonous, but nothing could be further from this in reality, as a glance through the illustrations will show, for though there is a repetition of certain forms and features, and we recognise at once that

every detail is familiar, yet it is this very similarity of idea permeating the whole of the district during this period that gives such a broad and dignified character to the work.

The walling is an indication of the sizes and quality of the stones to be found in the local quarry. The courses are thick or thin, regular or irregular, as the quarryman provided. In Northamptonshire alternate layers of red ironstone are sometimes employed, and the cottages are humble examples of the streaky-bacon style. Stones without mortar were frequently used in the barns and farm-buildings. Smoothness was avoided. One weak point in the construction is the indifference to the staircase, which was seldom made a decorative feature. In seventeenth-century examples the lintel was preferred to the arch for openings, and "externally the openings were never made wider than the stone would carry, and stout oak beams were used across the door and window openings inside." In describing windows, Mr. GUY DAWBER says:—

No description of the windows would be complete without speaking of the dormers, the most characteristic feature of these Cotswold houses. Their origin, which is very simple, arose in the following manner. The buildings were roofed in a single span, generally commencing about 12 or 15 feet above the ground, or some 4 feet above the bedroom floor. This did not give height enough for windows to be placed under the eaves at the sides, and as the bedroom was always constructed partly in the roof, it was necessary to carry up the side walls and form a series of smaller gables, with windows in them. These were treated in all respects similarly to the ordinary ones, finished either with a coping and finial or else with a stone-slate verge.

When the cottages were built the organ of "inhabitiveness" must have been developed among the occupants; now it is so little exercised it has obtained a different significance from phrenologists. One effect of it was that people generally had their names or their initials and the date of erection recorded over the doorways. The author remarks, "It is a pity that so simple a means of adding some small amount of interest and individuality to the entrance of a house should be but seldom seen nowadays, but, like most other local customs, this is rapidly dying out." The modern rustic's ambition is to become a citizen and to obtain a station from which the home of his early years will appear contemptible. In regard to finials, the mason was allowed to exercise individuality, if he possessed any, and the examples are often picturesque. Mr. GUY DAWBER dwells upon detail with a pleasure which is not common in books on architecture, but it is easily explained by his possession of a knowledge of the district derived from many years of personal study. His enthusiasm is likely to be imparted to his readers, and they will desire that the descriptive notes be longer.

In his photography Mr. GALSORTHY DAVIE has carefully limited his field of vision to the houses, and avoids the introduction of surroundings which, if picturesque, would fail to serve the purpose of the book. It will therefore be found that detail is more plainly shown than in large plates by ordinary photographers, who appear to be eager to compete with the landscape painter. The character of every stone in a wall or slate on a roof is manifested, for the collotype reproductions are perfect. Many lessons are to be derived from the plates, and they demonstrate at least that England has models which are as worthy of imitation as any in Holland.

The Société des Amis du Louvre have held their annual meeting under the presidency of M. Georges Berger. Its membership now exceeds 2,000, and its income is about 40,000 fr. The whole of this is devoted to the purchase of works of art for the Louvre, the acquisition for this year having been two sculptured columns of the twelfth century from the demolished abbey of Coulombs (Eure-et-Loire). They are exhibited in the Mediæval Sculpture section.

NEOLITHIC DEW-PONDS.*

DURING many centuries the earthworks of primitive man remained unrecognised because they were supposed to be not more artificial than the land around them. Nature had covered them with vegetation, and the lines they formed were so massive and simple, it was easy to assume the projections were due to forces which caused upheavals in the ground. When it was at length realised that they were constructed by human beings it became difficult to give the credit to the men who were possessed of the simple instruments which can be seen in museums. Tools and men are inseparable, and must always be taken into account, whether we are considering earthen banks, Greek temples or Gothic cathedrals. How were the early inhabitants of Britain able to protect themselves against wild beasts and wilder men by cuttings and embankments which were made by implements of flint or wood? As no answer was forthcoming from science, ignorant people in some places believed they were amongst the tasks performed by the fairies in order to provide enclosures for their revels at night. Others ascribed them to the Druids, while men who professed to possess some knowledge declared them to be Roman works. More rational conclusions are now drawn, and as a contribution towards a theory which has been based on close investigations, we must accord much value to the three essays by Messrs. ARTHUR JOHN and GEORGE HUBBARD. They relate to Cissbury Ring and Chanctonbury Ring in Sussex; Maumbury Rings and Maiden Castle near Dorchester, and cattle-tracks. They are grouped under the general title of "Neolithic Dew-ponds and Cattle-Ways."

Most people who have taken a holiday at Worthing, and have either walked or rode to the Downs, must be acquainted with Cissbury Ring. Local cicerones believe it to be the burgh of Cissa, one of the sons of ELLA. As some Roman remains were found at the place, it was allowable to conclude that it was an outlying Roman station. But there can be no question that long before the Romans utilised it, it was the site of a settlement. As the camp stands at a level of about 600 feet above the sea, the approach of enemies could easily have been seen. For a settlement Cissbury was an invaluable position. Chanctonbury is a couple of miles further north, and from it a wider expanse of country can be observed, for the height of the ring is over 800 feet. A question which must be asked is, How were men able to live and keep cattle at such sites in days when well-boring was unknown, and they did not possess the knowledge which would have enabled them to construct reservoirs? It is in connection with this inquiry that the authors have formulated the theory of dew-ponds:—

We are not aware that the thermodynamics of a dew-pond have ever been elucidated, and it is evident that this cannot be done until the construction of such a pond is understood. There is still in this country, at least one wandering gang of men (analogous to the Mediæval bands of bellfounders, masons, &c.), who will construct for the modern farmer a pond which, in any situation in a sufficiently dry soil, will always contain water, more in the heat of summer than during the winter rains. This water is not derived from springs or rainfall, and is speedily lost if even the smallest rivulet is allowed to flow into the pond. The gang of dew-pond makers commence operations by hollowing out the earth for a space far in excess of the apparent requirements of the proposed pond. They then thickly cover the whole of the hollow with a coating of dry straw. The straw in its turn is covered by a layer of well-chosen, finely puddled clay, and the upper surface of the clay is then closely strewn with stones. Care has to be taken that the margin of the straw is effectively protected by clay. The pond will gradually become filled with water, the more rapidly the larger it is, even though no rain may fall. If such a structure is situated on the summit of a down, during

the warmth of a summer day the earth will have stored a considerable amount of heat, while the pond, protected from this heat by the non-conductivity of the straw, is at the same time chilled by the process of evaporation from the puddled clay. The consequence is that during the night the moisture of the comparatively warm air is condensed on the surface of the cold clay. As the condensation during the night is in excess of the evaporation during the day, the pond becomes, night by night, gradually filled. Theoretically, we may observe that during the day, the air being comparatively charged with moisture, evaporation is necessarily less than the precipitation during the night. In practice it is found that the pond will constantly yield a supply of the purest water. The dew-pond will cease to attract the dew if the layer of straw should get wet, as it then becomes of the same temperature as the surrounding earth and ceases to act as a non-conductor of heat. This practically always occurs if a spring is allowed to flow into the pond, or if the layer of clay (technically called the "crust") is pierced.

Both at Cissbury and Chanctonbury depressions of the earth are seen which with good reason are assumed to have been formerly dew-ponds. There are, moreover, tracks which are taken to be the cattle-ways leading to the ponds, and the authors arrive at the conclusion that dew-ponds, owing to their importance, were protected by earthworks, that care was taken to facilitate communication with them, and that the dew-pond had a special guard, for whom a habitation was provided. Evidence of the same kind is to be found at Chanctonbury. The subject is well worth the investigation of archaeologists, especially as Worthing is easily accessible from London.

The earthwork known as Maumbury Rings, which is commonly believed to be the remains of a Roman amphitheatre, is described by Messrs. HUBBARD as a neolithic hill settlement, and probably was an early sun temple. They determined the orientation, and found it coincided accurately with that of Stonehenge. In such a place a helstone or sunstone would be necessary. But there is a reference to one which existed in 1719. It is also stated that a large stone was seen at the entrance, but as a farmer considered it was in his way, a hole was dug and the stone placed in it. Maiden Castle shows how the desire of self-preservation can endow man with a foresight which would be worthy of a VAUBAN, for we are told that "the complexity of the maze of stupendous earthworks by which the entrance is guarded baffles description. It suffices to say that an approaching enemy, furnished only with such weapons as were known to primæval man, must have found the place impregnable. To this day it produces a sensation of bewilderment, for every inch of its lengthy and tortuous course is dominated by a succession of spurs and embankments on either side, so arranged that tier above tier of the defending forces would be continuously encountered. An attempt to attack the settlement from any other point is not less obviously doomed to failure." Both inside and outside the rings of Maiden Castle there is evidence of dew-ponds, for without them it would not be possible to feed cattle at all times. The indications of their existence are likely to be soon obliterated, for farming operations are inimical to archaeological remains.

According to EMERSON, the cows are credited with laying out the city of Boston, and he maintains that travellers and Indians know the value of a buffalo trail, which is sure to be the easiest possible path. Neolithic man was also indebted to them, for he followed the lines taken by cattle in going from the upper lands to the rivers in laying out his banks and trenches. The dew-pond was in some cases intended to avoid the necessity and risks incurred by troops of cattle having to pass a long distance. It is curious to find it noted that the position of Stonehenge may have been determined by considerations for cattle. The authors remark that "the absence of any form of defence shows that the land adjacent to Stonehenge was considered safe from attack." The essays, it will be seen, treat of a most

* *Neolithic Dew-Ponds and Cattle-Ways.* By Arthur John Hubbard, M.D., and George Hubbard, F.S.A., F.R.I.B.A. (London: Longmans, Green & Co.)

interesting subject under a novel aspect, and as a valuable contribution to prehistoric archaeology we commend them to the attention of our readers.

GEORGE ROMNEY.

ON Monday the Right Hon. Sir Herbert Maxwell, M.P., lectured on this subject to the members of the Midland Institute. Sir Herbert remarked at the outset, says the *Birmingham Daily Post*, that he supposed no one had ever given much attention to the art of painting without being struck by the singular fact that in almost every instance in which a man or woman had attained distinction in that art he or she had been either of humble birth or, at all events, of very narrow means. It was not quite apparent why that should be so. At first sight one would say that those who were born to leisure and to means, exempting them from the necessity of working for their daily bread, and, above all, those who had the advantage of a liberal education, would be the persons who should devote themselves to what, after all, economically speaking, was a superfluity of life. But it was not so. And he thought the reason was pretty plain. It was because the preliminary drudgery before a pupil could acquire the technique of the art was so severe that it shut out all but the most earnest spirits and those who had little to sacrifice. The fullest and highest development of the natural powers could not be achieved by him who shrank from making the sacrifice complete, and he was the most likely to shrink who had the most to sacrifice. Romney was one who rose himself from very humble rank in life, and in the face of almost prohibitive difficulties, to the first rank of British artists. Referring to the name Romney, Sir Herbert said he had been informed that it was an alternative form of Romany, the old word for gipsy. The pretty district in which George Romney was born—Beckside, near Dalton-in-Furness—was one in which the gipsies most frequently settled. If that were the origin of the name of Romney they would be inclined to trace some of the wandering habits of the great painter to his gipsy ancestry. Having mentioned that Romney was born in 1734, the lecturer showed that he was sent to school when he was very young, that he was not a promising scholar, and that at ten years old he was taken from school and employed by his father in his carpenter's shop. Romney's father, "Honest John," was also a bit of an architect. Drawing materials were always lying about in the shop, and George soon showed that he had a natural turn for using them. It became apparent that he would be a bad carpenter, and at eighteen years of age his employer in Lancaster sent him back to his father with the information that he could make nothing of him, that he did nothing but sketch portraits of his fellow-workmen, and recommending that he should be apprenticed to an artist. Sir Herbert then described how George was apprenticed to an itinerant painter of eccentric character, named Christophen Stephen, who happened then to be working at Kendal; how, during that apprenticeship, he married his landlady's daughter; how he left his bride to work at York, when he was so poor that his wife sent him half a guinea from time to time to help him, and how in 1757 the apprenticeship was broken by Stephen suddenly decamping. Romney returned to Kendal, kindly families in the neighbourhood gave him helpful encouragement, and some of his early works were still to be seen in their houses and in the town hall at Kendal. Five years he worked at Kendal, when the insight which he had gained into the requirements of his art showed him that his natural powers could not be brought to perfection without a wider acquaintance with the work of the great painters. Then came the parting of the ways. To take his wife and children to London before he had gained a foothold there would be to fly into the arms of misfortune. They remained at Kendal, and he went forth alone to put his powers to the test. The lecturer sketched the career of the artist until 1773, by which time his independence was practically secured. He was still, however, painfully conscious of his deficiency in technique, and in March 1773 left London for Rome, where he worked with feverish energy for two years, and again returned to London. He had mastered the technical part of art, he had gauged his powers and trained his perception by humble contemplation of the works of the greatest painters. It only remained for him to test his strength. But he was penniless, and at last almost gave up his noble ambition and thought of commanding a competence

by painting "pot-boilers" in the provinces. The years abroad had interrupted the professional connection by which the painter must live, and the name of Reynolds was on everybody's lips. But it was well for British art that Romney did not lose his ardent confidence in his own powers. Had that failed him, and had not a few faithful friends stood by him in his need, how many charming canvases would now be missed from the walls of our public galleries and private houses? Then came his introduction to the Duke of Richmond, who sat for his portrait. It was greatly admired, and copies were soon in great request. The corner was turned, and sitters came to the artist in quick succession. The lecturer dealt with the remarkable rapidity with which Romney worked, and remarked that while he must be regarded as inferior to Reynolds, both as a draughtsman and colourist, he had much sounder method than his rival in the application of his pigments. After referring to the artist's rivalry with Reynolds, the lecturer next devoted a few moments to showing how Emma Lyon, afterwards Lady Hamilton, came into the artist's life and exercised the most powerful and lasting influence upon his art. In conclusion, Sir Herbert told the sad story of Romney's decline and his return to Kendal to his wife, the Mary of his youth, who had waited for him unmurmuring though not unmindful, and who tended him with true and tender care until his death at Kendal in 1802. His last resting-place was in striking contrast to that of Reynolds, who ten years before had been laid to rest amid great pomp in the greatest English cathedral. Romney was laid to rest in the little green God's acre at Dalton-in-Furness.

ACADEMY LECTURES ON SCULPTURE.

IN his fourth lecture, Mr. Gilbert, R.A., considered the influence of architecture upon sculpture in the nineteenth century, and the corresponding influence of sculpture upon architecture. His experience had led him to the conclusion that sculpture had had a greater influence upon architecture than the reverse. In the so-called revival of last century we had an extraordinary renaissance of architecture, but it came at a time when plastic art was in a state of hibernation. At that period some great architectural works were created in the Gothic style, and these were followed by others created under the influence of the Classic Revival. The Classic buildings were made by men whose desire was to emulate the Parthenon, and, with the idea of ultimately making their work compatible with their desires, they left spaces for sculptural decoration that are still unoccupied. But these men had not at their command the collaboration of fellow-workers who came up to their ideals, for the prominent sculptor of the time was above adorning or taking a second place. He wanted to make statues. The French meanwhile were working under a different influence, for their architects had helpers to their hands—workers in plastic art whom they could trust. They strove, too, less to revive a school than a tradition, and their architecture was a mixture of their own ideas with the Classic and the Renaissance. In France, therefore, we see nineteenth-century work showing the richest combinations of sculpture and architecture, while in England the fine architecture of that period was devoid of that co-operation.

According to the *Morning Post*, the lecturer said that he was brought up to look upon the Law Courts in the Strand as not fulfilling their purpose, but now, wherever he went, he saw little that was worthy of comparison with the efforts of the great architect by whom they were built. But he had not the chance to do what he wanted. There were no end of spaces and niches designed for ornament, but his palace was clipped of these through parsimony. Mr. Gilbert contrasted the Law Courts and St. George's Hall, Liverpool, with that wonderful building, the Paris Opera House, where the architect had provided for a remarkable series of works by contemporary artists. There was no building in England that could be compared with the Paris Opera House, except the Albert Hall—to which Mr. Gilbert gave more than a word of praise—and nothing at all that we could compare with the Paris Hôtel de Ville. With our Law Courts, again, he could not help comparing the Palais de Justice at Brussels, a stupendous work that looked as if it might have been the design of an Aladdin who had conjured up the building by a mere effort of thought. Yet this architect, who never lived to see his work completed, was nearly locked up as a lunatic. In England we had had among many others Pugin, Barry, Chambers, Pearson, Sedding and Bryden, men who had all gone, but whose

works still lived. The Gothic Revival brought about the building of the greatest palace in the world, the Houses of Parliament, the greatest, though Barry's designs were never completed. Mr. Gilbert noted the great influence of Pugin, and after a reference to Cockerell, spoke of Sedding, Pearson and Bryden as men who always had in their minds the necessity of making firmer the knot that should bind together plastic and sculptural art. Those three men, with others who, because they were living, he might not mention, were responsible for a new departure in the combination of architecture and sculpture.

Mr. Gilbert cited Sedding's church, Holy Trinity, Sloane Street, as a beautiful work made entirely with the grand idea of the combination of the arts, and from this passed to an appeal against the vandalism that would destroy old churches and "restore" ancient works of art. He pointed out how nearly the Strand churches had escaped demolition, and condemned in emphatic terms the destruction of buildings in Regent Street that had just been replaced by an erection that apparently was supported by upright panes of glass, an arrangement that was in the lecturer's eyes quite antagonistic to art. Mr. Gilbert begged his audience to use all their endeavours to prevent the sweeping away of buildings that had marked the greatness of the great city, and then turned to what he termed another act of vandalism—the completion of the incomplete works of great artists. He asked what would be thought of some learned man who offered to alter the works of the great masters of music, or of the artist who undertook to finish an incomplete portrait by Velasquez or statue by Michel Angelo? Finally he referred to the suggested completion of the Wellington Memorial by Alfred Stevens, which he spoke of as the finest work of its kind in England, with the possible exception of Torrigiano's monument to Henry VII. in Westminster Abbey. There were those, he said, who wanted now to make a new monument of Stevens's work. The spirit was rife and the purses were open of those who would contribute to such a desecration. But to interfere with the monument would be an insult to the memory of a great artist like Stevens, whose work in its unfinished state is as dignified as the mutilated Phidian marbles.

A large portion of Mr. Gilbert's fifth address was devoted to architecture, the mother and the chief of all the arts—the art that has taught us history, has inspired the painter, and has brought to life the necessity for the sculptor. The renaissance of architecture in the last half of the past century had been effective, Mr. Gilbert thought, chiefly in the direction of supplying domestic wants and in commencing to beautify our towns and our country in a way that should meet the requirements of a coming and a more advanced period, and fall in with the general march of things. In his last address he had pointed out how little chance the architect of a generation or two ago had of finding sculptors who would co-operate with him, and he had cited beautiful buildings that had been made by men who showed that they valued co-operation by making preparation for sculptural embellishments that were still wanting. But in the last twenty years things had changed for the better, chiefly through the influence of the advance of education. And in architecture especially, said Mr. Gilbert, was education essential. The architect had to be an educated man; if he were not he could not live. He had problems to solve, he had to respect mechanical conditions and many other things that the painter and the sculptor were told sometimes to overlook. So that the artist who really aspired to be an artist had no right to consider himself as above co-operating with a man who could conceive and build a great edifice, an edifice which would itself conserve the work of the painter and the sculptor by whom it is adorned.

Mr. Gilbert said that he was very keen upon the subject of the co-operation of the architect and the sculptor. Their work together had begun in England, and in some respects we were perhaps better off than our continental neighbours, who had never lost touch between the two arts, and were therefore to some extent bound down by traditions. He would not like to call the new movement an evidence of originality, for the word was one to which he objected. The students should be warned of the danger of seeking too much after originality—it was a snare, and often tended towards eccentricity. The quality in itself would be better formulated if it were called purpose, or intention, or endeavour, or, still better, decision. And after all what was called originality was really individuality. Style was another word that nobody could define, except perhaps the French critic, who said that "the style was the man."

One heard people say of a work, "Such style—like Michel Angelo." But if it were like Michel Angelo where was its originality? Returning after this diversion to the subject of the co-operation of the sculptor and the architect, the lecturer expressed his belief that hand in hand they would inaugurate in our country an epoch of art equal to that of any past period. In years to come he hoped that the students would be able to see that this hope of his was not merely an idle dream, and they should be glad and proud if they were able to contribute even in the smallest way to the development of this great artistic movement.

He had spoken very freely the other afternoon upon the vexed question of restoring and completing other men's work, and he still felt as then, that undue meddling with such work was nothing less than desecration. The artist was not a restorer but a creator. Therefore he should create rather than imitate, and never take upon himself to act as critic of his brother's creation or of interfering with it except to preserve that brother's work from actual decay. Then it became his duty to try and preserve it. What would they say if they heard that the Government was about to overhaul the national collections and to alter and complete the Greek marbles by adding arms and legs to such as wanted them, on the ground that modern ideas demanded that they should be brought up to date? Mr. Gilbert criticised the men who altered the proportions of sculptural figures in elevated positions with the idea of making them look right from the lower standpoint, and suggested that a man standing on a ladder 60 feet high looked just as right in proportion as when he was on the ground. Finally Mr. Gilbert referred again to Watts and to the reforming and humanising influence of his art. The students, too, must aim at humanising by creating beauty, whose influence should be as powerful in another way as that of the head of Medusa, which turned everything to stone. The aspect their art gave to life should turn all ugliness into dirt and into the gutter. As sculptors they were not to think only of making a statue. They should aim at making every work a conquering expression of beauty and a something that should combat the heartless brutality of the common herd. For the artist to sign his work is the very last thing he should think of; his work should be signed enough by the excellence of his endeavour.

STUDY OF ART IN ITALY.

THE new regulations for the admission of artists and students gratis to the Italian galleries and excavations are very much more stringent than they have been hitherto, and it would be of great service if newspapers would draw the attention of their readers to them. In the case of artists and students they should now submit their credentials to the Italian Ambassador in London, and on his certificate a pass will be granted. Until lately the certificate of the artist's consul was accepted. Now unless the artist has provided himself with a certificate from the Italian Ambassador in his native country he must make his application to the Ambassador accredited to the Court at Rome, who must first judge whether the applicant belongs to a "recognised academy," and if in his judgment he does so forward his application to the Minister of Education, who eventually sends a pass to the Embassy, whence it is usually forwarded to the Consulate of the city from which the application is made, and then by the consul transmitted to the applicant. The pass when obtained permits the bearer to measure, sketch and photograph, and to go in and out of the gallery or excavation free as often as he pleases. If he wishes to copy a picture he must apply to the director of the gallery in which it is exhibited, who will inform him under what conditions he may work.

Amateurs can obtain permission to photograph on application to the director of the gallery or excavation in question. The application must be on stamped paper of 60 c., which can be procured of any tobacconist in Italy.

The Restored Monument of Bishop Hooper, Bishop of Gloucester and Worcester, who was burned at the stake on February 9, 1555, has been unveiled in Gloucester. In 1861 the foundation-stone of a monument to his memory was laid on the spot on which he was burned, and this was in due time completed and unveiled. It represented the bishop on a high pedestal, an ornamental canopy, supported by four pillars, being over the figure, which is life-size. The work has been under the direction of Mr. Waller, the cathedral architect.

NOTES AND COMMENTS.

IN all things relating to building, Manchester from its importance is expected to show an example to other provincial cities. Having wealth and skill it ought to represent progress, especially in buildings where science has to be recognised. It is therefore not satisfactory to learn that two trustees of the Royal Infirmary have resigned their positions through apprehensions that the new buildings will be of too costly a character, or, in other words, will subserve the latest theories of medical science and energy. Mr. ALFRED SIMPSON in his explanation says that when the instructions to the architects who were to compete were prepared he protested against the adoption of the "unit" system, as being costly in construction and adding greatly to maintenance per bed. When plans were adopted he again protested against the enormous cost per bed. Mr. SIMPSON believes that the character of the institution, when at Stanley Grove, will be changed. It will become much more a teaching hospital, instead of the primary one for the treatment of the sick poor. Placed there the professional influence will increase, and the lay share in the management must decrease. Mr. JOHN KENDALL's objections are financial. Originally it was calculated that a building to contain 500 beds could be erected for 250,000*l.*, or 500*l.* per bed. The plans selected were estimated to cost 324,000*l.*, with a margin for extras not to exceed 10 per cent., which if put down at 7½ per cent. makes a total of 350,000*l.* Added to this there has been the cost already incurred of acquiring land, &c., 45,000*l.*; architects' fees 5 per cent. and surveyors' fees 2½ per cent. on the 350,000*l.*, 26,000*l.* There is also the furnishing, estimated at 25,000*l.* Taking the interest to be paid on bank advances at from 30,000*l.* to 40,000*l.*, and assuming that a central receiving house and out-patients' department, with site, will cost 20,000*l.*, the financial responsibility to be incurred will amount to at least half a million. It will be observed that there is no charge of unnecessary expenditure. If hospitals are to be erected which will correspond with the most advanced practice in medicine and surgery a large outlay cannot be avoided. On that account membership of hospital boards and committees involves constant anxiety, but there are always courageous volunteers for the office, and liberal supporters also arise from time to time.

IF ADOLPH MENZEL lived until December 8 he would have completed his ninetieth year. For seventy of them he has been before the world as an artist. Beginning with pen-and-ink drawings, he afterwards took up lithography, and next he devoted himself to drawing on wood. Meanwhile he endeavoured to learn the mysteries of oil-painting, and in his twenty-first year he produced his *Chess Players*, which he described as *mehr knetend als malend*, i.e. kneaded rather than painted. He might therefore be considered as an illustrator, and if he lived in France he would probably have been treated like GUSTAVE DORÉ, and never recognised as a painter. MENZEL was, however, very skilful in painting, and he was more fascinated by light and shade than many of his contemporaries. Artificial light no less than daylight afforded him opportunities which he gladly seized. Nature endowed him with all the qualities which are requisite for a painter, and he improved them by study and exercise. But if he were a less able man his position in Germany would be just as privileged. He confined himself to the history of Prussia, and especially to the history of FREDERICK THE GREAT. The latter was a theme which caused much misery in the CARLYLE household, and people still wonder why CARLYLE should have bestowed such colossal labour on "The Last of the Kings." He imagined that he was carrying out his mission. MENZEL may not have given attention to a mission, but he knew the subject was within his powers. Never was there a king who was

made the subject of so many drawings and paintings as FREDERICK THE GREAT, and [never was there an artist who was more honoured in consequence. The first wreath to be laid on his corpse was that sent specially by the KAISER. In England his work was always regarded coldly, and consequently it was more appreciated by artists than by the general public. He painted for his countrymen and succeeded in what he attempted. As long as Prussia prevails in Germany MENZEL's renown will be secure, and for painted biography his works must be accepted as almost unique.]

ILLUSTRATIONS.

WESTMINSTER CATHEDRAL: FRONT, LOOKING WEST.

MOUNT STUART, ISLE OF BUTE. N.B.: UPPER PART OF ENTRANCE HALL.

CLOCHER ST. ANTOINE, LOCHES.

THIS tower is one of four or five good examples of Early Renaissance still existing in Loches, and, being the highest object in the town below the ancient castle, it forms a striking object from many points of view, and groups most happily with the picturesque masses of the castle, which, were the sketch extended panoramically, would appear some little distance to the left, high up. It is now a solitary tower, unconnected with any buildings as old as itself, but at its base may still be seen a few traces of a once famous chapel. Built in 1529, the tower belongs to probably the richest period of French Renaissance, but it combines with the usual exuberance of detail belonging to this period also considerable dignity. A circular staircase turret, just indicated in the sketch, pleasingly varies the sky-line from another point of view. The tower served formerly as the belfry of the town and district, and still retains the name.

ST. OURS, LOCHES.

THE romantic old town of Loches possesses in its church of St. Ours, says Mr. HAIG, one of the most singular ecclesiastical monuments in Europe. Seen from any point of the valley to the east and north of the town, the church forms a conspicuous and picturesque object in the group composed of the various buildings of the famous castle of Loches; but it is only on nearer approach that the peculiarity of the building becomes apparent. There is a tower over the crux and one over the west end of the church; but these features are to be met with elsewhere, and it is only when we come to contemplate the roof over the nave that any striking departure is observed from the ordinary arrangements of churches. The roofing has been effected by means of two octagonal pyramids, almost as pointed as the east and west spires, but of course springing from a much lower level, and open to the vertex. The effect of the four points formed by these roofs and the two spires is not happy from all external points of view, but the impression of the interior is rather pleasing. The covering over the crux is of similar shape, but terminates at a lower level than the nave roofs, and at the west end a combination of low and massive arches supports the tower, the lower part of which is open to the nave. The church terminates to the east in a central apse and two smaller ones, projecting from the transepts, as indicated in the illustration. The western termination consists of a low square narthex, which, as well as the crypt under the choir and the lower part of the western tower, date from the eleventh century, and the rest of the church from the twelfth, the whole having been completed in 1180.

CATHEDRAL SERIES.—ST. ANAPH: GENERAL INTERIOR, FROM EAST END.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. E. Guy Dawber, president, in the chair.

The following were elected as members:—Messrs. J. M. H. Watson, C. E. Lovell, R. C. Coulson, M. Jewson, T. D. Dixon, J. Filtress and A. A. Fillary. Messrs. James Lemon and A. S. Millar rejoined.

A vote of condolence to the widow and relatives of the late Mr. John Leaning was passed.

The PRESIDENT said he had a very pleasurable duty to perform, and one in which all members would readily join with him. It was to accord a hearty vote of thanks to their old friend, Mr. W. G. B. Lewis, for the work he had accomplished in arranging and supervising almost by himself the hanging of the casts round the museum. Mr. Lewis had undertaken no light task, and he gave his services ungrudgingly for nearly a year past. Although the hanging of the casts was not quite completed, they could appreciate the good work achieved by Mr. Lewis in his labour of love.

A vote of thanks was also passed to the Board of Education authorities at South Kensington, and to the Society of Antiquaries for the loan of lantern slides.

Mr. C. S. SPOONER read the following paper:—

Church Fittings.

What do we include in church fittings? I do not much like the word, and it may be understood to cover a very wide field, including everything except the actual structure of the building. I take it to mean the furniture and ornaments of a church and such decoration as is connected therewith. The furniture for a church differs from house furniture chiefly in the difference of scale and the different use to which it is put—these two conditions will, of course, materially affect the design, but there need not be any other difference. Church furniture may be of any shape and of any material, and it may be decorated in any way that pleases the fancy—provided always, of course, that it is in good taste, suitable for the solemn and sacred purposes for which it is used, and also that it complies with the rules and directions of those in authority.

What do we mean by a church? I take it that we mean a building set apart for the worship of Almighty God, and I must still further restrict the meaning, for the purposes of this paper, to the worship of the Christian religion.

For our purposes to-night we may think of Christians as divided into two schools of thought—the one, while by no means neglecting or underrating the office of the preacher, looks upon the Sacrament of the Holy Eucharist as the central act of worship and centres everything round that act; the other school, while not neglecting prayer and praise, looks upon the sermon as all-important. Of course, each school is subdivided—the latter very much so indeed—but these subdivisions do not concern us here. Each of these schools keeps, more or less everywhere, its own general arrangement of churches. In the first the altar is always the central and chief feature of the church, and in the second the pulpit takes that position.

Now, it is with the furniture and ornaments of the church of the first school of thought to which I have referred that I propose to confine myself. I must still further clear my ground. This school of theological thought is, as we all know, roughly divided into three, which divisions are respectively known as the Orthodox Church of the East, the Roman Catholic Church and the Church of England.

Differences in the rites and ceremonies of these three bodies make some differences in the furniture and ornaments of the churches belonging to each, and it is with those of the Church of England that I am chiefly concerned to-night.

There is, unfortunately, some difference of opinion about the laws and rules affecting the furniture and ornaments of the Church of England, in spite of the clear directions in the ornaments rubrick, which is placed in a prominent position at the beginning of the Prayer Book, and which runs as follows:—"And here it is to be noted that such ornaments of the Church and of the ministers thereof at all times of their ministration shall be retained and be in use as were in this Church of England, by the authority of Parliament, in the second year of the reign of King Edward the Sixth." It must be remembered that the word "ornaments" is not confined, as by modern usage, to articles of decoration. . . . "All the several articles used in the performance of the services and rites of the Church are ornaments."

The Alcuin Club has issued a very valuable tract on this subject by Mr. J. T. Micklethwaite, in which he points out that the second year of King Edward VI. began on January 28, 1548, and ended on January 27, 1549, and that, as the first Prayer Book could not, according to the Act authorising it, be used by the authority of Parliament earlier than February 11, 1549—i.e. three weeks after it had received authority—the rubrick refers to the ornaments that were in use before the first Prayer Book of King Edward VI. Mr. Micklethwaite, after giving very convincing evidence for his opinion, proceeds to give a list of the ornaments that were in use in the year 1548, and he says:—"I cannot hope that nothing will be left out of it, but I will try that nothing shall be put into it for which reasonable proof cannot be given." Such a list by such an authority is, I think, useful to us. I do not propose to give the whole of the list; there are many things which have become useless—e.g. crescents for lights and the chafing ball—and there are several which seem to me to be outside our subject.

But it is well to know, on the authority of a learned archaeologist, what furniture and ornaments are included in the rubrick which regulates these things for the Church of England.

The list of things runs as follows:—Images and pictures; the high altar; minor altars; the table or reredos; the altar shelf; the canopy of the altar; the upper frontal or dorsal; the nether or lower frontal; the frontlet; the curtains, riddels or costers; carpets; tapestries; lamps; the altar cross; the altar candlesticks; standing candlesticks; the chalice; the paten; the cruets for wine and water; a box for altar breads; the censer, &c.; two basins for washing the hands; registers, viz. a thin strip of silver with ornamental ends, for use as a book-marker; the sacring bell; processional cross, &c.; alms basins; the lectern for the Gospel; the lavatory, called in Latin *sacarium* or *piscina*; the sedilia; screens; the rood-loft; other lofts; the rood; stalls and desks; the great lectern; lectern cloth; lesser lecterns; the organ; chanters' stools, &c.; pews; pulpit; a desk for books; tables with inscriptions; the font; the font cover; the Litany desk; a cross for funerals; the bier or hearse, standing candlesticks, &c.; banners, standards or streamers; the dedication crosses; bells in the steeple, the clock and chimes. To this list we might add certain things as being required in our churches nowadays, all of which have been authorised by the proper authorities. Here let me remind you that nothing should be put into a church without the authority of the bishop of the diocese—the parish priest, be he rector, vicar, or curate-in-charge, is responsible to the bishop for everything put into the church or churchyard. Some means of warming the church; some means of lighting the church at nights or on dark days; notice boards; hymn boards; alms boxes; a bookcase for devotional books; cupboards or boxes, either in the vestry or in the church, in which to keep the frontals and altar linen, the vestments, the candles and other things; a safe, preferably in the priest's vestry, if there be more than one vestry, in which to keep church plate, the alms, until the money is put in the bank, the registers and other valuable things.

This is a long list, and there is, no doubt, a great deal to say about many of the things included in it.

Let us, therefore, first consider the most important.

The first and most important thing in the church is the altar. It is one of the things essential in the worship of the Church. Most of the other things are conveniences, but some sort of altar, together with a plate and a cup, are absolutely indispensable. Besides this, on account of the sacred use to which it is put, churchmen have always desired to make the altar the most beautiful and most honourable thing in the building. In a large building the problem is how to do this, because, even if the altar is as large as possible, it still remains a small thing relatively to the building. The two ways which have centuries of precedence are, I think, still the best. First, to place it on a raised platform, reached by a flight of steps, and then, if possible, to put a canopy over it, or, at any rate, some rich background. All those things in the list, such as the reredos, the canopy, the upper and nether frontals, the carpets, tapestries and the standing candlesticks, are for this purpose.

The altars in the churches throughout England in the year 1548 were nearly all made of stone. Mr. Micklethwaite says, in the tract to which I have referred, that "there can be no doubt that wooden altars were sometimes used in England in the fifteenth century, and they were not mere

makeshifts, but things of some cost." And, further, "The destruction of the old altars and the substitution of movable wooden tables, which seem to have been set up at the time of the celebration of the Eucharist, appears to have been begun in the diocese of London by Dr. Ridley, in the fourth year of King Edward." "The real contest in the seventeenth century was not about the material so much as the position of the altar, and that was finally set at rest after 1662."

All through the eighteenth and the first part of the nineteenth centuries stone or marble altars were by no means uncommon. Sometimes they were fixed to the walls or floor, and old stone altars still remain in Arundel Church, in Gloucester Cathedral and elsewhere. Of late years, however, some of the chancellors of the dioceses have objected to altars of stone or marble. I think this is regrettable and curious considering the words of the rubrick.

I think everyone will agree that, although the altar is seldom seen, it should nevertheless be made of the very best quality of whatever material may be used, and the construction should be good and handsome.

It is important that the altar be of sufficient size, and, in order to give it due importance, the larger it is the better. No considerations of utility need limit the length, but anything shorter than 5 feet is likely to prove inconvenient. I think it is a safe rule to make it as long as possible, so that it will look well and be in good proportion with the sanctuary where it stands. Utility will regulate both the height and the width. The priest stands at the altar during the whole of the celebration; it must, therefore, be high enough so that he may not be obliged to stoop unduly at any part of the service. Although men vary considerably in height, it has been found by experience that 3 inches is the limit of variety in the height of an altar. Anything lower than 3 feet 3 inches is most inconvenient for a tall man, and 3 feet 6 inches is as high as a short man can possibly use. I have made some altars 3 feet 6 inches high, and the clergy who use them tell me they find that height convenient; but it is the extreme limit, and I think, perhaps, 3 feet 5 inches is the most convenient height for an altar.

It is important not to make it too wide. The corporal is usually about 20 inches square, and a little more width than that is needed. I think 2 feet is as narrow as an altar should be, and 2 feet 3 inches is a better width. Unless the altar shelf (when it is intended to have one at all) stands on the altar, 2 feet 6 inches will be found to be wide enough for any altar.

Altars should be quite simple in design, with no elaborate mouldings or carvings in high relief. It is essential that the edge of the top be almost square, the angles should be just softened, and if it is desired to enrich it with mouldings they should be sunk into the flat edge, but on no account must such mouldings turn over on to the top of the slab. Unless the top of the altar is perfectly flat and smooth right out to the extreme edge, there is a risk of the sacramental vessels being upset. There is also a danger of irregular projection or points, such as might occur in high-relief carving or open tracery, catching in the vestments of the celebrant. Such risks should not be run. Moreover, ornament of this kind is out of place. It is better for altars to be quite plain in design but of handsome material, and to reserve for the frontals such ornament as funds will permit.

The top or slab should be thick and heavy. A slab of stone or, better still, marble carried on five pillars is perhaps the best general form; or if wood is to be used, then I think it should be framed together with five or more legs braced at the bottom, and carrying a thick top, which (so that it may not split or warp) should be framed with flush panels. I have myself made wooden altars with framed fronts, ends and backs; but I now think that is not the best way, and I recommend the form of a heavy table as being altogether better.

What I have said about altars applies, I think, to all, whether a high altar or side altars, with one exception. The minimum length of 5 feet is not enough for a high altar, *i.e.* an altar which may be used for a high celebration; the minimum length in this case should be 8 feet, as the celebrant, the deacon and the sub-deacon stand side by side in certain parts of the service, and anything shorter than 8 feet looks undignified. In churches where there is only one altar it is better to make it the high altar, and a length of 8 feet will not be found to be too much even in the smallest churches. A high altar should always stand raised upon a platform, three steps above the level of the sanctuary floor, and not more than three. The sanctuary itself may be at any level above the chancel that is not

inconvenient. These three steps are required for the celebrant, the deacon and the sub-deacon, or, as they are sometimes called nowadays, the gospeller and espistler. I myself prefer the old names.

The top step should be deeper from front to back than the others; a clear space 3 feet at the least is necessary in front of the altar, and rather more is better. The other two steps should be at least 18 inches deep (front to back). The height, or rise, is a matter of taste, and will be different under different conditions, but I think it will be found inconvenient if the rise of each step is greater than 7 inches. The rise of all three should be the same.

It has been supposed that the cross and candlesticks should not be placed upon the altar itself. It appears, however, that in the year 1548 these ornaments often stood upon the altar, and Sir Walter Phillimore wrote to one of the members of the Alcuin Club that "No Court has decided that it is illegal to put candlesticks directly on the mensa."

The altar shelf has become very usual nowadays, no doubt by reason of the foregoing supposition; nevertheless, it does not seem to have been uncommon towards the end of the Middle Ages to put the cross and candlesticks on a ledge or shelf, either standing on the altar itself, or just behind it. It is mentioned in many inventories, where it is described by different names, which, however, all mean the same thing. In some places, I think, such a shelf adds to the dignity of the altar and is a convenience. It is better for it to stand behind the altar rather than upon it, unless the altar is very broad, in which case it should be loose. In the former case it becomes the base of the reredos. The shelf should be from 9 inches to 12 inches wide, to give room for the cross and candlesticks to stand upon it, and it should not be too high.

It may be ornamented with carving or painting or covered with a cloth, coloured and ornamented or not, according to circumstances.

The object of the reredos is, as I have said, to give dignity and importance to the altar, and this should be the first consideration in designing a reredos. It must be spaced in such a way as not to detract from the altar nor to overpower it, but rather to add to its prominence and make it unmistakably the principal object at the east end of the church. The existence of a reredos will not necessarily do this—indeed, it is possible to draw the attention away from the altar and to make the reredos itself the principal object; and it is very easy to do so, especially as the purpose of the reredos is not always sufficiently realised. I suppose effect is produced by the right relation of things one to another, by subordinating certain things to other things and by concentrating the means at disposal at the right points. Certainly, differences of spacing and proportions make great differences in effect.

The size of the reredos will vary, of course, greatly. Much will depend upon the amount of money that may be spent upon it, upon the character, materials and lighting of the church. Besides giving dignity and prominence to the altar, it should harmonise with its surroundings in size, shape and material. Generally speaking, the simpler it is in form the better it will look; much variety of outline seldom adds dignity, and often detracts from that quality. The choice of material, too, is a thing of vital importance to good effect, and no general rules can be given, since any material may be used. There is, however, one material which seems to me hardly suitable for a reredos, and that is mosaic—unless the reredos is to form a part of a complete scheme of mosaic decoration. If mosaic is used at all it needs to be used in large quantities and in conjunction with marble, also used in large quantities. Under these circumstances, nothing perhaps could be finer. But a single panel of mosaic, surrounded with a frame of marble or alabaster, is so very different to all the surrounding material that it seems impossible to make it take its proper place in a building. Again, I think it is a safe rule never to use mosaic unless it can be 15 feet at least from the eye.

Generally speaking, I think the reredos is better as a separate thing, not forming part of a scheme of wall decoration, but a definite background to the altar, a sort of solid screen at the back of it, with perhaps the altar shelf or shelves forming part of it. These shelves can be used for flowers at high festivals. There are many ways in which such a reredos can be treated. There are some old examples for instance, those at Winchester Cathedral, St. Albans and Southwark, to mention three well-known ones. They consist of a great screen of niches filled with figures, but divided as to give due importance to the altar. This is done by a vertical division a little wider than the altar and by

part immediately over the altar being treated on a different scale to the rest.

The effect of these reredoses must have been magnificent. There seems little hope that we can do anything of this kind at present. Our sculptors nowadays seem to have turned their attention to realistic portraiture instead of to decorative art, and until someone arises who is possessed with both the devotional and the decorative spirit, figure-sculpture is out of our reach—unless, indeed, M. Rodin would turn his immense powers to express the devotional as well as the intellectual.

A painted reredos might be attempted with better chances of success, if, indeed, there was any real desire to make use of the best of our painters to ornament our churches. I cannot forget the fact that five, if not more, really great painters—men who possessed the decorative and the devotional spirit equally, I think, with any of their predecessors—have died during the last few years, but as far as I know, only one of our cathedrals and very few, if any, of our parish churches have a single example of their paintings.

There is one picture by Watts at St. Paul's Cathedral, which, unless I am misinformed, he himself gave to the Dean and Chapter, but we shall have to search indeed to find any paintings by Rossetti, Madox Brown, Burne-Jones, Millais or Watts in our churches. Thousands of pounds have been expended upon stained glass during the lives of these men, much of which is rather a disfigurement than an adornment to the churches where it has been put up.

I am afraid architects have been too ready to employ tradesmen to carry out decorative work rather than artists. I know quite well how much more smoothly everything goes. Promises are kept, the work is done very cheaply, and, alas! these things please our clients more than a work of art would. The blame must, therefore, rest upon their shoulders rather than on those of the poor architect, who certainly has to bear quite enough blame for other people's failures.

Of course unless there is a good deal of money to spend on a reredos it would be impossible to employ a great artist, be he sculptor, painter, or anything else, although I am inclined to think that it need not be so costly as is sometimes supposed.

It is a mistake to attempt any sort of figure decoration unless an artist can be employed. It is of no importance whether the artist is working independently or for a firm so long as he is an artist and can work and express himself freely. But so far the firms who undertake decorative work have not succeeded in finding artists to work for them, with some rare exceptions. I think the reason is that they have not realised that an artist cannot work except in his own way. If he has to obey orders and do as he is told, one of two things happens—either he gives it up altogether or he degenerates into a mere mechanic. I believe great good might come to everyone concerned if these firms could be induced to employ artists, to consult them about their part of the undertaking, and put them in direct touch with the customers and allow them to have the credit due to them for their work, and leave them as free as possible to work in their own way and to pay them a fair amount for their work. It would relieve the artist of much business which the business man would do better, and it would save the business man from bothering about things that he has no ability to deal with, and from a good deal of humbug.

In cases where figurework would be too costly, very good effects may be produced by painted patterns, more or less repeating, dividing and powdered over a field of colour, or even colours. I need hardly say that it wants a very nice sense of colour to produce a good effect, but this surely comes within the work which an architect should undertake personally. For such a purpose I would recommend the use of very few colours, and I think very much may be learnt from good examples of heraldry in the use of colours and metals.

The heraldic rule—never to put colour on colour or metal on metal—is one to bear in mind, although it need not be so binding in decoration as in heraldry; such rules tend to simple effects and treatment, and are useful on that account.

Every one will find his own method of using colour. One very good way I would suggest is to lay on the colour very light—almost, if not quite, pure—and then to glaze it down with thin coats of colour superimposed till the brightness or crudeness has been brought down to harmonious tone. Personally, I much prefer tempera to oil paint. I think it is a pleasanter quality and it darkens less with time.

This brings me to the upper frontal, or dorsal, which serves the same purpose as the reredos, namely, to give dignity and prominence to the altar, and it is perhaps the best way of doing so in poor churches where they cannot afford a good reredos. It may be of any material, even cotton, and may be hung in any way that will give a good effect. If it is brought right forward over the altar as a canopy a very good effect may be obtained, but it looks much better if the material is suspended over rods of metal and is all in one piece, rather than if it be strained over a board. I think hangings nearly always look better if hung more or less full. The folds of hanging drapery are one of its distinctive beauties, differentiating it from everything else. It is a little more difficult to hang it full and to bring it forward over the altar, but it is worth the extra trouble. There is, however, one drawback to a canopy—it is apt to get very dirty from the smoke of the candles; indeed, a canopy must always be a considerable height above the altar. The amount of smoke that a good-sized candle makes is surprising, and, as the candles always stand in the same position, the smoke is concentrated in one place. For this reason, too, it is well to arrange for the candles to stand well away from the dorsal, or from the reredos either.

At either end of the altar should hang the curtains or riddels. They should be about as wide as the altar, and may be of any height so long as they are well above the candles, to protect them from being blown about by currents of air. It looks better, I think, for them to be a good bit lower than the dorsal, unless the dorsal itself has to be low. They may be hung from rods which fit into sockets in the east wall or attached to the poles which carry the dorsal. In some old manuscripts with pictures of the celebration of the Mass the riddels are shown hanging from rods carried by poles at the four corners of the altar, and also as a continuation of the dorsal, the whole being carried round the three sides of the altar.

The dorsal and riddels may be of any colour or colours, and of any material. The colour must, of course, harmonise with surroundings and the liturgical colours of the frontals and vestments. The dorsal and riddels are not changed with the frontal to the colour of the day. When funds permit it is nice, of course, to have extra gorgeous hangings for the great festivals, but two sets are enough for any church.

It is, I think, absolutely necessary to see a large piece of the material in the church in the position where it is to hang before choosing. The surroundings and light are so very different to a show-room, and in a building the size of a church very strong colour is necessary in order to get any effect of colour.

Most delicate tints have a tendency to look grey. But it is impossible to make any general statement, for colours are so very much affected by what is next to them or near them, by light and by position, that it is almost impossible to tell how they will look without seeing the actual materials together in the position they are to occupy.

The nether or lower frontal is "the cloth in front of the altar, to which the name frontal is now generally given."

The frontal for the high altar "was amongst the things to be found by the parishioners," says Mr. Micklethwaite in his *Alcuin tract*, "and old pictures of English altars in use always show them vested." "There is no English authority for the altar itself being carved and painted. Most old ones were quite plain, but a few were panelled in front; as, for instance, that in William of Wykeham's chapel in the cathedral church at Winchester. The covering of the altar with 'a carpet of silk or other decent stuff' at the time of service was ordered in the canons of 1603, which set forth the least in the way of ornament which might be tolerated."

The frontal need not be mounted on a wooden frame. If it is well made with a proper backing, it can be hung with rings and hooks under the slab of the altar, and can be folded up and put away in a drawer when not in use. The five liturgical colours in the Church of England are white, red, green, purple and black, and therefore five frontals are required. Black is only used for funerals, on Good Friday, and on occasions of national mourning. Poor churches can do without it—on such occasions they would use the purple frontal. A dark indigo blue answers the same purpose as purple, and it is easier to get a good quality of colour in this than in purple. Any colours may be used to decorate the frontals that fancy can desire, so long as the colour of the day is not obscured and everyone can see that it is white, red, green or purple. The purple frontal should have very

little ornament and should be very subdued; it is used at penitential seasons and sometimes at funerals.

"The frontlet was a strip of stuff fringed on the lower edge and sewn as an 'apparel' on to the front edge of one of the linen cloths, from which it hung, so as to hide the suspension of the lower frontal."

The frontlet need not be changed with the frontal, and may be of any colour that will harmonise with the five frontals. It is better, I think, to have a purple and a black frontlet to use with those two frontals.

It is usual for both frontals and frontlets to be ornamented with embroidery, and, when it is well done, nothing could be more beautiful or suitable. But, just as much as the painting of the reredos, it needs an artist to do it. The firms and the church shops have failed in this respect just as dismally as they have in pictures and windows, and, unless an artist can be employed to do the embroidery, it is much better to do without. Simple bands of colour or woven or printed patterns will be infinitely better than the mechanical and inartistic work of which there is such a painful amount in our churches.

Carpets are often mentioned in old inventories, but it does not follow that the word means what we understand as a carpet, viz. a floor covering. It was used for any cloth or covering. The cloth covering the seat of the sedilia and that covering the lectern were called carpets as well as floor coverings. A carpet to go on the floor and over the steps in front of the altar is a great addition, almost a necessity. It prevents any chance of the priest slipping, and makes all his movements quiet. I like to see it brought right down the chancel—it gives a fine bit of colour and a strong leading line up to the altar.

Tapestries, or wall-hangings, are amongst the ornaments of the rubrick, and may be used with good effect in many places, particularly on the east wall and round the sanctuary.

The Altar Cross.—Mr. Micklethwaite says:—"A cross was not thought a necessary ornament for an altar, although a common one. The cross which a parish was bound to provide, was for processions. But often it served for the altar as well, being fitted with a foot to stand in and a staff for carrying. This cross generally had a figure of Our Lord crucified, and sometimes there were brackets at the sides with figures of St. Mary and St. John."

The bede roll of St. Mary's, Sandwich, recorded the benefaction of John Colwyn and his wife, who gave "the best cross of sylver and gylt with a staf of laton ther to, the whyche cost XXV^l," and also of Thomas Grene and his wife and John Byschop, who gave "the fote of sylver for that crosse to stand ther on the hygh auter."

There is a curious superstition in the minds of some people, and, amongst others, some of the chancellors of the English dioceses, that although a cross may be used on our altars, it must on no account have a figure on it. In the year 1548, to which the Prayer Book refers us, it seems more than probable that every altar cross had a figure on it. Inasmuch as the cross is the Christian standard, I do not know that it is a matter of great importance, from a didactic point of view, whether it bears a figure or not; but from that of the artist it is very desirable, when funds will permit. I think it is generally accepted that it requires the highest artistic ability to represent the figure properly, and one would suppose that every Christian would desire to see the best art and the best work lavished on the standard of the Kingdom of Heaven. Here, again, when there are no funds to provide a work of art, it is better to have no figure at all.

In my opinion any kind of naturalism in a crucifix should be avoided—a quiet, dignified figure, expressing self-sacrifice and Divine love, rather than a human being in torment is very preferable. I myself like the sentiment of early Christian art, that of Our Lord conquering Death, better than the late Mediæval and Renaissance treatment of the crucifix. The altar cross should not, I think, be very large. It is, after all, the standard in front of the priest, rather than in front of the people. The great rood answers the second purpose, and it is always behind the priest when he is in the sanctuary.

"The direction in the Order of Communion," says Mr. Micklethwaite, "that the old service should continue without varying of any rite or ceremony, sends us back to the ancient usage as to altar lights." "The Order of Communion was to come into use on Easter Day, 1548, and to continue until it was superseded by the English book of 1549." The ancient usage "differed much in different churches, the only fixed rule being that there should be at least one light on

the altar at the time of Mass. Rich churches would have more, and it was the custom to vary the number according to the day or service, but the greater number of parish churches probably had ordinarily two lights on the high altar and one on each side altar."

"On occasions the number used might be very great, but, as a rule, the extra lights were put round about the altar rather than on it. The lights were used at Matins, Mass and Evensong.

"The modern custom of having several sets of candles on the altar at the same time for use at different services has no authority in antiquity."

It is better, I think, for candlesticks to be of the same material as the altar cross, and here let me say that it is not necessary to use brass. It is, no doubt, a very good and beautiful material, which is, by the way, generally spoilt by being lacquered, and sometimes a material of another colour would look better.

I must pass over several things in the list of ornaments, of which, no doubt, much might be said, such for instance as the chalice and the processional cross. The lectern for the Gospel is rarely if ever used nowadays. Mr. Micklethwaite says, "richly furnished churches often had them," and "in a few churches, chiefly in Derbyshire, stone Gospel-desks are found against the north wall. Such exist at Mickleover, at Crich and at Chaddesden, all in Derbyshire."

We do not always find a piscina in modern churches. It is supposed not to be required, but that is a mistake. It is required as much to-day as it was in the Middle Ages, and for similar purposes. It may be made as a beautiful little niche in the south wall of the sanctuary, and it may be combined with the credence, although a projecting shelf or table is more convenient than the small shelf found in many old churches. The drain from it should always run into the ground.

The Sedilia.—Mr. Micklethwaite, in the Alcuin Club tract, gives the following interesting note:—

"What we call the sedilia is the last remnant of the bench which, in primitive times, ran all round the apse and was assigned to the priests, whence probably by tradition came the name presbytery, which seems to have been the old English name." In the contract for the rebuilding of Catterick Church (1412) they are called three prismatories, an evident corruption or miswriting of presbyteries.

The sedilia is a triple seat for the celebrant, deacon and sub-deacon. It should always be on the south side of the sanctuary. In old days it was generally formed in a triple niche, or arcade, recessed in the wall, and the seats were sometimes stepped down to express the degrees of the clergy, but this was not always done. There are many beautiful examples of the sedilia and piscina and credence combined in an arcade of four arches or niches. Of late years it has become more usual to make the sedilia a separate and movable piece of furniture generally of oak, sometimes with a back and canopy, and on the whole, it suits us better than stone seats, which are apt to be rather cold. In building a new church it would be well to form a recess in the south wall large enough for three seats side by side, and to fix a wooden seat and back divided into three, allowing a width of 2 feet for each seat at least, and more if there is room. Everything must be soft, smooth and round, no sharp points or open tracer that might catch in the vestments. There is no longer any need for a canopy now that the windows are filled with glass and the church is comfortably warmed.

(To be concluded.)

MR. ROOSEVELT ON ARCHITECTURE.

THE President of the United States was not able to devote much time to the Convention of the American Institute of Architects at Washington, and the members had to be content with the following brief address:—

It is a great pleasure to have the chance of coming here this evening and saying a word of greeting to a body of men who are engaged in doing work for this Republic which is to count not merely in the present generation, but during the lifetimes of many generations to come. We hear a great deal said about true Americanism. Now the real American, the American whom it is worth while to imitate, such, is the man whose belief in and work for America is not merely for the America of to-day, but for the America of the future.

It is a comparatively easy thing to do work when the reward is to come in the present; but every great nation that has ever existed on this globe has been great because its sons had in them the capacity to work for the well-being of generations yet unborn. Such a spirit is peculiarly necessary when the work that we desire to have done is essentially work of a non-remunerative type, non-remunerative in more than one way; non-remunerative in money and it may be in fame. We do not know the names of the architects and builders of the great cathedrals whose magnificent bodies are an heirloom to civilisation. We do not know the names of the builders of the great majority of the works to which every man with any aspiration after beauty naturally turns when he thinks of the past. We owe that beauty, we owe the elevation of thought, of mind and soul that come with association and belief in it to the fact that there were a sufficient number of men who worked in the spirit that Ruskin prayed in—the spirit of doing work not for the sake of the fame, but for the sake of the work itself.

There are things in a nation's life more important than beauty, but beauty is very important. And in this nation of ours, while there is very much in which we have succeeded marvellously, I do not think that, if we looked dispassionately, we will say that beauty has been exactly the strong point. It rests largely with gatherings such as this, with the note that is set by such men as those I am addressing to-night, to determine whether or not this shall be true of the future.

A very large percentage of the durable work, the work which is lasting, must be done by the Government. Great buildings and beautiful buildings will be erected by private subscription; but many of the grandest buildings must necessarily be erected by the Government, national, state or municipal.

Those in control of any branch of that Government necessarily have but an ephemeral lease of power. Administration succeeds administration; congress succeeds congress; legislature succeeds legislature, and even if all of the administrations, all of the congresses are actuated (a not necessarily probable supposition) by an artistic spirit, it would still remain true that there could not be a coherence of their work if they had to rely on themselves alone. The best thing that any administration, that any executive department of the Government, can do—and if I may venture to make any suggestion to a co-ordinate branch, I would say that the best thing that any elective legislative body could do—is in these matters to surrender itself within reasonable limits to the guidance of those who really do know what they are talking about.

The only way in which we can hope to have worthy artistic work done for the nation or for a state or for a municipality is by having such a growth of popular sentiment as will render it incumbent upon successive administrations, successive legislative bodies, to carry out steadily a plan chosen for them, worked out for them by such a body of men as that gathered here this evening. What I have said does not mean that we shall go here in Washington, for instance, into immediate and extravagant expenditures on public buildings. All that it means is that, whenever hereafter a public building is provided for and erected, it should be erected in accordance with a carefully thought out plan adopted long before, and that it should be not only beautiful in itself, but fitting in its relations to the whole scheme of the public buildings, the parks, the drives of the district.

Working through municipal commissions very great progress has already been made in rendering more beautiful our cities from New York to San Francisco. An incredible amount remains to be done. But a beginning has been made, and now I most earnestly hope that in the national capital a better beginning will be made than anywhere else, and that can be made only by utilising to the fullest degree the thought and the disinterested effort of the architects, the artists, the men of art who stand foremost in their professions here in the United States, and who ask no other reward save the reward of feeling that they have done their full part to make as beautiful as it should be the capital city of the great Republic.

The Administrators of the Carnegie donation for the erection of a "Palace of Peace" have decided to admit to the competition for the selection of plans and designs architects of all nationalities besides those who have already been specially invited to compete.

OLD DUBLIN PLASTER.*

SO far as plaster is concerned, the Renaissance in England may be described as that fresh departure which, beginning with the tentative efforts of imported workmen by Henry VIII., reached its highest development in Inigo Jones and Christopher Wren, and eventually ran itself out in the uncertainties induced by the literary eclecticism which sapped the energies of art at the time of the Union. After that, architects abandoned the Italian and Roman examples and applied themselves to all sorts of revivals more or less literal. Nowhere is the change more marked than in our old plasterwork.

Until the end of the sixteenth century, when the great Inigo Jones began to work, the transitional Elizabethan and Jacobean, in which the new detail overlaid the old constructional types, prevailed. With Inigo Jones, these islands were introduced to Palladio's art (which was a closer conformation to the Roman models and the precepts of Vitruvius than had previously obtained in Italian work), and his matured treatment of it exercised a healthful influence upon our architecture for the next 200 years. While other countries ran into all sorts of extravagances, the main lines of our architecture, whether developed externally or internally, have always been true to his Palladian traditions. In plaster and other such decoration only have we permitted license.

Sir Christopher Wren, although he only lived twenty-three years into the eighteenth century, may be regarded as its architectural father. His is a strange example of how genius and assiduity may make up for the lack of sufficient training in early years. A Fellow of All Souls, Oxford, at twenty-one, and Savilian Professor of Astronomy at twenty-nine, he slipped into his profession over the wall, as someone has remarked, like "Formalist" and "Hypocrisy" in Bunyan's "Pilgrim's Progress," but, unlike them, he proved that he had a right to be there. Though he was a true successor of Inigo Jones as a Palladianist, and his sympathies were with Bernini, the intended Italian, rather than with Perrault, the actual French architect of the Louvre, his foreign studies were limited to France, and most of his life's work, like that of Grinling Gibbons and Caius Cibber, his colleagues in plaster and wood, exhibits French leanings. I know, however, of only one example of plasterwork in Dublin in which Wren was concerned, and that is the ceiling of the chapel at the Royal Hospital, Kilmainham,† an institution like the Chelsea Hospital, now partially occupied by the Commander of the Forces and his staff.

Gandon, the architect of the Dublin Custom House, commenced in 1781, states that the design of the Royal Hospital had been attributed to Inigo Jones, but points out that as the latter died in the middle of the seventeenth century, and the Royal Hospital was commenced towards its close, it was rather unlikely. It has been ascertained by Sir Thomas Drew and Mr. Penrose that the design was due to Sir Christopher Wren. Sir Christopher did not, however, come to Dublin to superintend the execution, and, as in the case of Sir William Chambers's designs for Trinity College and Charlemont House, there were doubtless many stupid misinterpretations and ill-advised alterations and additions.

Still more unlikely is the current belief that the plaster decoration of this ceiling was modelled by Cipriani. Cipriani was much more of a painter than a sculptor, and belongs to the latter half of the eighteenth century. In his younger days he did some work for Lord Charlemont at Marino, Clontarf, and probably at Charlemont House, of which I shall have to speak presently, and in later years we hear of him in connection with Angelica Kauffmann and her second husband, Antonio Zucchi, who were largely employed by the architects, Robert and James Adam, in painting the panels of their ceilings. The modelling of the plaster details was as a matter of fact often entrusted to Pergolesi.

This ceiling is distinctly of the school of Grinling Gibbons and Caius Cibber (who, by the way, was the father of the celebrated Colley Cibber, actor and dramatist), full of exuberant, naturally treated, deeply undercut foliage, fruit and flowers, and as far removed from the enervated modelling which accompanies the panel painting of Cipriani, Kauffmann or Zucchi in such houses as that of the Representative Church Body in St. Stephen's Green, as it would be possible to imagine.

* From the lecture delivered by Mr. Howard Pentland, R.H.A., of the Office of Works, before the Association of Master Painters in Ireland, in Dublin, Convention of 1905.

† For some of the illustrations see *The Architect*, Oct. 2, 1903

Rococo influences were now at work and soon began to show their mark on the freer Palladian treatment of the old Roman acanthus scroll *motif*. The Rococo variety of the Renaissance, a style to which Michel Angelo showed decided leanings early in the sixteenth century, might have been developed by his immediate successors but for the restraining influence of Palladio, who lived a generation before Inigo Jones. It is hard to define Rococo in a few words. It developed and flourished perhaps more luxuriously in France than elsewhere during the reigns of Louis Quatorze and Louis Quinze, a period extending from Cromwell's Irish Viceroyalty to the opening of Grattan's Parliament. Its chief characteristic is the mutilation of every feature of architecture and decorative sculpture by interruption or broken curvature, or both, and the filling-in of plain spaces with symmetrically disposed medleys of architectural, animal and vegetable forms, often tortured and scrolled out of recognition, and frequently combined with the realistic garlands and wreaths which characterise other Renaissance styles. It is a general name for those foreign extravagances which never took root in this country except in internal plaster and woodwork, and in external stone panels, tympana and cartouches, and even there only in a simple and comparatively restrained manner, and (except in much of Sir Christopher Wren's and Ware's work) with Italian rather than French feeling. Most people are familiar with it in old picture-frames, good or bad; but in France it infected all architecture, and has broken out again and again—in our own days in such work as Charles Garnier's great building, the New Opera House, Paris. Some of it is very charming, but if you want principle you must look elsewhere.

Dublin Castle, 1740.

When the viceregal residence known as the State apartments was built is a subject upon which authorities differ, and nothing definite is known about the architect or the original artificers. In "Pool and Cash's Views" published in 1780 it is stated that they were erected in or about 1740.* The names of Ivory, Castel, Ensor, Cooley, Sempie, Smith, Mack, and other architects are indelibly associated with the design and superintendence of many well-known public buildings of the early eighteenth century, and those of Sir William Chambers and some others with the design only. In those days it was not uncommon to employ a great architect to make drawings (or even a preliminary sketch) probably without even a visit to the spot, and entrust it to the tender mercies of a clerk of works to work out, adapt, or alter as he or his employer thought fit. Finally they clothed it with the details of carvers and plasterers, in many cases foreigners, who had at least the merit of having been selected by and trained under some of the great home or foreign architects of the day.

Owing to the political and social unrest in the century preceding the Union, there were even more causes than now tend to the chopping and changing of official residences. When chopping and changing goes on, it is very difficult in comparatively modern times to assign dates from style alone, because there are always three courses open to the designer—to carry out the alteration in accordance with the original style; to carry it out in accordance with the current style; or to carry it out in accordance with his own fancy, if not the fancy of some influential person. Be this as it may, the main character of the plasterwork of the small reception-room is, so far as the cove is concerned, in accordance with the freer forms of the early eighteenth-century work. It shows traces of Rococo feeling in the birds and trophies, but the ceiling proper, in which are flat ornamental ribs with plain and ornamental panels, is in accordance with the native Palladian feeling of the seventeenth century, which Sir William Chambers strove to maintain against the advancing tide of Rococo and later styles.

Another example from a building close to the State apartments, now used for official purposes, also belongs to the first half of the eighteenth century. The relief is tolerably high. It became less, as a general rule, towards the close of the century. Here we have Rococo detail in modest development, the swags as usual defying gravitation. Such work might be reproduced by casting, did not the deep undercutting stand in the way; but its great charm lies in its being done *in situ* by the free hand, and largely by the thumb. A good broad, flexible thumb, and a fair gift of draughtsmanship and modelling,

constituted the plasterer an artist in those times, and distinguished him from the ordinary tradesman of the trowel and float. He had an intelligent interest in and love for his work, and he knew that the better his work the better his pay. He thought of Cibber and of Grinling Gibbons, and that, like them, he might fill a niche in the Walhalla of art. (Grinling Gibbons, by the way, was the real author of the now poor and infirm equestrian statue of William of Orange in College Green, Dublin—not Van Nost, as is commonly supposed.)

Modelling is sculptor's art, be it in wood, plaster or anything else, and the humblest freehand modeller of a leaf differed, not in kind but only in degree, from Cibber or Chantrey. In those and earlier days the great sculptor did not as now desert the lowlier field of decorative sculpture. He filled in with due subservience to the architect's composition the spaces allotted to him. He gathered young workers of all classes around him, who worked up from leaf to limb, and studied the engaged grouping of leaf, limb and inventive form as a part of subordinate architectural expression, before they essayed monumental figures and groups. The result was that the sculptor's profession was not so precarious a one as it is now for many who are not Royal Academicians. In the intervals between detached statesmen and dukes in *al fresco* glory, the sculptor of fame stretched his second string, and tendered for such work as I am now showing to you.

Trades-unionism has extinguished all this. Every workman, according to the dictates of this movement, is as good as his fellow. Besides this, the development of manufacture and the requirements of civilised society are now so much more than they used to be that architects have to be architects only, and not architects, engineers, painters, sculptors, armourers and jewellers, as they were in the days of Michel Angelo; or even dramatists as in the case of Sir John Vanbrugh. So late as the close of the eighteenth century Vincent Waldre, the architect of the Board of Works, executed the historical paintings on the ceiling of St. Patrick's Hall with his own hand. The brotherhood of artists and workers has been ruined by these two causes, and until it is in some measure restored the days of freehand plasterwork on our walls and ceilings *in situ* will not come back—I do not say that it is not to be got, but it is for the rich and cultured few, not for the people in the sense in which it was in the houses of the middle classes before the Union.

Few young sculptors of to-day are masculine enough to tackle the sweeping thumb work of a ceiling. Sir Thomas Drew remembers meeting an old resident in Waterford whose grandmother had been employed by John Roberts, great grand-uncle of Earl Roberts and architect of Waterford Cathedral. She used to say how well she remembered "the beautiful Italian gentlemen and their spectacles, lying for hours on their backs jammed up against the ceiling, about the year 1770."*

These men worked cheaply. There is no useless high finish about their work where it cannot produce an adequate effect. They made "lightning sketches" in plaster when on the scaffolding and reserved their higher finish for work at the level of the eye, and they didn't work by the hour.

The paintings on the ceiling of St. Patrick's Hall, and probably much of its ornament, are of a much later date. The paintings, as I have just mentioned, are the work of Vincent Waldre, who was architect to the Board of Works in Gandon's early days. He was a native of Vicenza, and was brought to Dublin by the Marquis of Buckingham. He possessed considerable ability as a historical painter, and was one of the seven architects who were consulted on the additions to the House of Commons before the ultimate conversion of the Senate House into Bank premises. The subjects are St. Patrick preaching, Henry II. in Dublin, at the ends, and in the centre the noble Marquis bringing peace and prosperity to Ireland.

Trinity College, Dublin, as I have already mentioned, was largely designed by Sir William Chambers, who lived from 1726 to 1796, an able but rather too coldly correct successor of Wren. He did not superintend the work, and that executed is by no means free from mistakes and incongruities. It is stated in "Pool and Cash's Views," published in 1780, that the principal or west front was approaching completion from his designs in 1759. But as I am more concerned with domestic work this evening, I propose to show you some examples from the Provost's House. The design of this, according to Pool and Cash, was taken from

* The Parliament House now occupied by the Bank of Ireland was first occupied in 1739.

* The spectacles were, of course, to protect their eyes.

Campbell's "Vitruvius Britannicus," and was attributed to Richard, third Earl of Burlington and Cork. The English architects of those days were, many of them, terrible sycophants, and, dealing with a rich and *dilettante* nobility, were apt, whilst advertising themselves, to exalt their clients' thumb-nail sketches, or even suggestions which they were afraid not to adopt, to the level of designs, and to flatter some of them into the belief that they had genius. Mr. Reginald Blomfield, in his admirable work on the English Renaissance, has shown, in spite of Horace Walpole's easy assimilation of all the commercial humility of Campbell and Kent, and Leoni, a Venetian architect, who was another "ghost" of Lord Burlington's, that there is every reason to believe that they were the real authors of all that was attributed to this so-called architect.

These examples well exhibit the restraint of those architects like Chambers, who, whilst adhering to the precepts of Palladio, were able to give a native character to their decorative work, but they lack the warmth and freedom, the *élan*, of the best Rococo. Men of Chambers's type were so afraid of license that they became architectural prudes. Poor Chambers! He would have been rather sick had he seen the Trinity clerk of works' version of his central feature facing College Green, but he would have collapsed altogether had he seen some of the fine free internal detail. A man like Chambers only promotes those lapses from orthodoxy which he seeks to prevent.

Leinster House, 1745.

In 1744 James, twentieth Earl of Kildare, afterwards first Duke of Leinster, had a house in Suffolk Street. So had Richard Castel, the real architect of the Parliament House, now occupied by the Bank of Ireland. He was the "ghost," who was not even paid the stipulated amount for his designs and advice by the so-called architect, Sir Henry Pearce, one of those geniuses (like Richard, third Earl of Burlington and Cork, the reputed architect of the Provost's House) who are supposed to have burst upon the scene fully equipped, like Pallas from the brain of Zeus—men who, like poets and Swiss admirals, are born, not made.

The Earl employed Castel, bought the ground between Molesworth Street and Merrion Square, known then as Mynchen's Fields, from Viscount Molesworth, and, in spite of the remonstrances of his friends (who thought the site too remote), laid the foundation-stone in 1745. It has a long inscription, beginning

DOMUM
CUJUS HIC LAPIS FUNDAMEN
IN AGRO MOLESWORTHIANO,

and ending with the name of the architect. I am not going to describe Leinster House, which has been occupied by the Royal Dublin Society since the battle of Waterloo,* for everyone who does not know it ought to go and see it. When masquerades were introduced into Dublin in the last half of the eighteenth century Leinster House was the scene of the most sumptuous entertainments. On these occasions Gilbert tells us that the rank and fashion of Dublin used to stroll through such houses, which were thrown open for the occasion, before going down to see Peg Woffington at Violante's Theatre or the subsequent masquerades at the Rotunda.

The ceiling of the Duke's own *sanctum* has a very beautiful treatment of free acanthus ornament, but with the same contempt for gravitation as we observed in a previous example. The staircase presents a nice, sober piece of wall decoration, showing both extremes. The three main panels are intended for family portraits without further framing, and the narrow intervening panels are quite in the style of Gibbons, whilst the inevitable Rococo is beginning to clamber over the constructive lines.

We now come to a tremendous departure. I am going to ask you to imagine that you are all Rip Van Winkles and have gone to sleep during the Irish Rococo period, from the battle of Fontenoy till the first meeting of the "Whig Club" in 1791. The second duke gave a magnificent series of entertainments to those who supported his parliamentary party on the Regency question, and, probably in anticipation, had brought over James Wyatt, a London architect, who was following closely in the footsteps of the celebrated Robert and James Adam. Robert was buried in Westminster Abbey the next year, and James survived him only two years. Under Wyatt's directions the "long room" on the north side was redecorated in the now popular and fully developed Adam style, which bore the same relation to the

Rococo, alongside of which it grew, as the Louis Seize style bore to the sober Rococo of Louis Quatorze and the extravagant Rococo of Louis Quinze, or as the Sheraton and the Adam furniture bore to the Chippendale.

Rotunda Hospital, 1751.

We must now, like the bucks in the second duke's time, go from his picture gallery in Leinster House to the Rotunda, where the gardens were as much the resort of fashion as Ranelagh and Vauxhall. Castel had seen the Parliament House built from his designs in 1739 and Kildare House, afterwards Leinster House, commenced in 1745, and in 1751 another of his important works, the Rotunda Hospital, was commenced. This hospital, which was opened in 1755, owes its existence to the exertions of Dr. Bartholomew Mosse. He had previously established the germ of his scheme in South Great George's Street in the house that had been Madame Violante's theatre, the scene of the famous Peg Woffington's triumphs.

It is easy to recognise the same hand in the staircase and the ceiling, where the signs of the Rococo, now so popular on the Continent,* are even less than in the Leinster House examples. But in the chapel Rococo extravagance is strongly in evidence. The cove was probably modelled by another hand and possibly at a later date; at all events, by someone more in touch with contemporary foreign work.

The Rotunda itself, which consists of a series of rooms for public entertainments, built to supplement the hospital revenues, was designed by Ensor.

Charlemont House, 1763.

In 1762 Lord Charlemont selected a site on the north side of the fashionable Rotunda Gardens and employed Sir William Chambers, the bent of whose genius I have described when speaking of Trinity College, to design Charlemont House for him. The house was commenced in 1763 and was occupied by the family till 1870, when it was bought by the Board of Works. It has since been used as the office of the Registrar-General. The house reminds me of Chambers in many ways, but some of the decorative plaster-work does not. Observe how the outer enriched mouldings of some of the internal door architraves are prolonged and scrolled into pedimental forms to hold masks of Bacchus, or other features, instead of being left to do their own business. Chambers had previously been employed for Lord Charlemont at Marino, his Clontarf residence, where some of the decorative sculpture was designed by Wilton and some chiaroscuros were executed by Cipriani, and it is known that a sculptor named Vierpyl, whom Lord Charlemont had met on his travels, was employed on some work at Charlemont House. Chambers, like Wren, was, I believe, never in Dublin, so that his interior work was probably altered and embellished to an extent that would have surprised him.

"Buck" Whaley's House, No. 86 St. Stephen's Green S., 1785.

No. 86 St. Stephen's Green South is a famous house adjoining Lord Clanwilliam's house, now forming portion of the "Catholic University." It was commenced in 1785 by Richard Capel Whaley, father of the celebrated "Buck Whaley," one of those dare-devil magnificents of the type that Lever has so well described. He was also known as "Jerusalem Whaley," because he made a bet that he would go to Jerusalem, play hand-ball against the walls and get back in some incredibly short space of time. He pocketed 20,000*l.* over the transaction, and won another large sum by jumping out of one of his windows over a mail coach beneath. His father seems to have been of a somewhat similar disposition, as he swore that he would build such a house as would make his neighbour's—Lord Clanwilliam's—look like a pigstye.

The design is evidently by some architect who, while keeping to Palladian lines in his main features, was somewhat partial to Rococo detail. You observe the usual fantastic features, the panel mouldings with broken curves scrolling into quasi-vegetation, or clasped by it; the shells, the suspended trophies of musical instruments, and the contrasting festoons of realistic flowers.

I have referred to the fact that you may look in vain for principle in Renaissance plaster. Its attraction lies in its refinement and its waywardness. In fact, it has a feminine charm. Pope said that most women had no character at all, and he meant it for satire; but Shakespeare, who knew men and women very much better, saw that it was the perfection of women to be characterless, as Desdemona and Ophelia. So much for the sentimental side. On the other hand,

* Malton's well-known View of Dublin, published in 1794, gives a very full description of its beauties in its heyday.

* Louis Quinze was about half-way through his reign.

whenever I see monumental paintings like that of Vincent Waldre's in St. Patrick's Hall, representing the Earl of Buckingham distributing peace and plenty, hear Italian and Dutch names bandied about, and see heathen gods and goddesses with their insignia presiding over our houses, I always think of Thackeray's cynical shafts in the "Book of Snobs," where Major Ponto and Mr. Snob are shown over Lord Carabas's house by the housekeeper.

Before concluding I want to say a few words about Italian workmen. It is the habit to speak of Dublin eighteenth-century plaster and kindred work as if it was peculiar in this respect; but ever since Henry VIII. brought over John of Padua and all his men, it has been the fashion for architects and virtuosi to bring over foreign workmen from time to time, especially Italians, for Italy is the fatherland of the Renaissance. I have therefore not troubled to look for their names or to lay much stress on the point. That a good many were brought over is doubtless true, and if you wander along the quays and back streets you will meet with many an Italian name on a signboard—architects, too, such as Leoni and Vincent Waldre were introduced from time to time.

In our new departures, which I hope may in no way be related to that terrible thing known as *l'Art nouveau*, let us look for something better to work upon than the threadbare ornaments and implements of dead people, whose ghosts have already been raised so many times.

Photographs of plasterwork in the Royal Hospital, Dublin Castle, Trinity College, the Rotunda Hospital, Leinster House and many other old mansions were exhibited and described.

MODERN ARCHITECTURE IN LONDON.

AT the rooms of the Leeds and Yorkshire Architectural Society on Thursday, the 8th inst, Miss Ethel Charles, A.R.I.B.A., read a paper on "Modern Architecture in London," Mr. G. B. Bulmer, F.R.I.B.A., president, in the chair.

The President, in introducing the lecturer, explained that Miss Charles was the only lady Associate of the Royal Institute of British Architects.

The lecturer said that London is believed to contain more bad work than any city in the world, though it contains some of the finest buildings in existence, but that most of these buildings had been erected during the last thirty years. Art in architecture was certainly advancing, and the favourite scapegoat of our art is the public. Salt-glazed bricks were not used nearly enough, as they keep their colour and do not collect the dirt and grime like stone and brick. Slides were shown on the screen of New Scotland Yard, National Liberal Club, City of London Schools, London School Board Offices and many others, which illustrated how the general tendency of modern work is to experiment rather than to rely on tradition, how modern work is personal rather than national, and how it is characterised by endless diversity, and how this diversity is further intensified by the complexity of modern life and modern requirements, and also by the large amount of material within easy reach. How steel, unacknowledged, plays so prominent a part in modern designs accounted for much of the unsatisfactory appearance of our street architecture. Many of the buildings on the Embankment were shown, as this is the most successful river frontage in Europe, and it would be difficult to find so many fine and important buildings in one thoroughfare, ranging from the Houses of Parliament to the electric-light station, and which offer excellent examples devoted to the most varied purposes.

The lecturer also spoke on the question of whether to treat a building as part of a scheme or as an isolated building, but favoured the latter.

There were also shown slides of various business premises in the City, as illustrative of the fact that it is to the commercial element of our social condition that we must look for the growing prospects of London architecture.

A discussion afterwards followed, and a vote of thanks to the lecturer was proposed by Mr. R. P. Oglesby and seconded by Mr. W. H. Thorpe, F.R.I.B.A.

Walmer Castle will, it is officially stated, no longer be used as a residence for the Lord Warden. The rooms of historic interest, as well as the ramparts and gardens will, subject to regulations, be thrown open to the public on and after May 1 next.

GENERAL.

The Bournemouth Town Council have decided to erect municipal buildings for the borough at an estimated cost of 70,000*l.*, exclusive of a sum of 14,000*l.* for the cost of the land. Mr. F. W. Lacey and Mr. C. E. Mallows have been appointed joint architects. The Council also contemplate other costly schemes, including the preservation of the cliffs and the construction of an undercliff drive at an estimated expenditure of 58,000*l.*, besides the purchase of the Belle Vue hotel site, near the pier, at a cost of 60,000*l.*, on which to erect a kursaal or pavilion.

The Lord Mayor of Liverpool (Mr. John Lea) is to be entertained by the artists of London at a dinner at the Prince's Restaurant, Piccadilly, on April 27. The chair will be taken by Sir Laurence Alma-Tadema, R.A.

The American Academy having purchased a villa in Rome, a Bill has been introduced in Congress for its incorporation under the laws of the United States.

A Memorial of the late M. Gérôme, the French painter, is to be erected in the garden of the Louvre. It will be the work of his son-in-law, M. Aimé Morot, the sculptor.

Mr. R. Phené Spiers was elected honorary member of the American Institute of Architects at the Washington Convention.

The Manchester and District Branch of the Classical Association, which was established last autumn, has been informed by the excavations committee, that there are about a dozen sites within a radius of 30 miles from the city, in several of which it would be advantageous for the Association to undertake or aid systematic excavation. There was also the work of watching for finds in Manchester when important alterations were taking place.

Mr. Charles Horsley, of Highbury New Park, London, and of Wharf Road, City Road, London, civil engineer, has left property valued at 67,443*l.*

The Local Taxation Returns show that the sum received by the London County Council from the local taxation account was 1,145,811*l.* The Council raised loans which amounted to 3,120,750*l.*, while the amount received by it out of the rates, added to the grants under the Agricultural Rates Act, was 2,531,228*l.*, as compared with 2,432,670*l.* in 1901-2. The rateable value of the Administrative County of London, according to the valuation lists in force on April 6, 1902, was 40,677,589*l.*, including 21,964*l.*, the rateable value of agricultural land.

In All Saints Church, Dorchester, a mural brass to the memory of Thomas Beach, of Bath, the celebrated portrait-painter of the eighteenth century, and the pupil of Sir Joshua Reynolds, was unveiled on the 10th inst. The brass was designed and executed by Messrs. Singer & Son, Ltd., of Frome. Beach was buried in the churchyard in 1806.

The Glasgow Executive Committee of the Hector MacDonald National Memorial on Saturday finally resolved to erect the monument on the site of the town flagstaff at Dingwall, from which a view of the surrounding country for some twenty miles around can be obtained. The monument can be seen from the late General's birthplace in the Black Isle. Mr. J. S. Kay, the architect, estimates that the cost of the memorial will be over 2,000*l.*

The Royal Dublin Society announce that under the Taylor art scholarships a sum of 100*l.* is offered for competition amongst Irish art students not exceeding twenty-five years of age who shall have attended for twelve months a school of art in Ireland, or who, being of Irish birth, shall have attended a school of art elsewhere. Competitors will be required to produce at the exhibition to be held on March 20 a work or works of art in one of the four classes.

The Society of British Sculptors held a statutory meeting on Tuesday, Mr. T. Brock, R.A., presiding. The following officers were elected:—President, Thomas Brock, R.A. treasurer, Sir Charles Lawes-Wittewronge; secretary, Perc Edsall. Council:—Alfred Drury, A.R.A., George Frampton, R.A., W. S. Frith, F. Lynn Jenkins, W. Goscombe John, A.R.A., Sir Charles Lawes-Wittewronge, T. Stirling Le David McGill, F. W. Pomeroy, W. Reynolds-Stephen Hamo Thornycroft, R.A., and F. Derwent Wood.

The Prince of Wales has offered to present two paintings by Constable and two by Corot, and the Princess of Wales one by Constable, as contributions to the proposed Gallery of Modern Art for Dublin.

Mr. G. M. R. Layton will deliver a lecture this evening to the Nottingham Master Builders' Association on "Portland Cement." Mr. Robert Evans, architect, will preside.

Architect.

The Architect.

THE WEEK.

An exhibition is now open in the Industrial Museum at Berlin which is not without interest for Englishmen. Through many causes the farmhouses, peasants' cottages and other buildings in villages and country districts of Germany have received as little consideration as those in England. They have been sacrificed to the necessities of individuals. Of late, as in this country, it has been discovered that they possessed interest and their loss is deplored. Efforts are now being made to preserve the examples which have survived. One of the objects of the exhibition is by means of paintings, drawings and sketches to convince the citizens of Berlin and other visitors how much picturesqueness is to be found in the country, in the hope that deeper interest will be taken in the buildings. The exhibition is also intended to demonstrate by means of selected designs by architects that it is possible to erect buildings which will meet all the necessities of agriculturists and others who wish to derive wealth from the land, that it is possible to have efficient buildings without suggesting that they are allied to the factories and manufacturers' premises which are also being set up in places regardless of the contrast they offer to the landscape.

It suggests the anxiety of the Germans to maintain their hold on cement production and, if possible, to extend it, when we find they have offered about 700l. in prizes for essays on the chemistry of the material. The following subjects are proposed:—Demonstration of the properties and of the hardening process of calcareous hydraulic cements synthetically, analytically, microscopically, mineralogically (hardening in air, fresh water and sea water). (a) To prove whether silicic acid, alumina and oxide of iron combine with lime as crystalline compounds in stable proportions or as colloids in varying proportions. (b) To prove whether double combinations result between silicic acid, alumina and oxide of iron with lime, and in what manner these substances are engaged in the hardening process. (c) Consideration of the swelling phenomenon which accompanies the hydraulic hardening. (d) Consideration of the influence of the temperature and length of time of the burning process on the different kinds of hydraulic cements. (e) Properties of puzzolana and its hardening with lime, beginning with silicic acid as the most active and prevailing puzzolana, alumina, oxide of iron and manganese, independent and in combination with silicic acid, as natural or artificial puzzolana. Competitors have up to the end of 1906 for the preparation of their essays, which are to be sent in to the Ministry of Public Works, Berlin. The aim of the offer is no doubt to interest a large number of men of science in the production of cement. The subject is important, and out of the effort something may be gained by manufacturers. The scheme is, moreover, worth attention as evidence of the close connection which exists between trade and Government in Germany.

The office of engineer to the City of London is important. It should be held by a gentleman of superior attainments and wide experience. There is rivalry between the City and the County of London, and any works undertaken in the City ought to be as fully designed as possible. The salary which the officers and Clerks committee proposed to be paid to the next engineer appointed was 1,250l. a year, rising to 2,000l. Some members of the Council considered that the salary should commence with 1,500l. per annum. Eventually a majority succeeded in having an amendment adopted by which the salary is to com-

mence at 1,000l. a year and never to exceed 1,500l. The City of London is looked upon as a standard in municipal affairs, and whatever it does is imitated. The proposed salary, which is too low, is therefore likely to have effect in many towns which employ an engineer. That consideration should always be borne in mind by the Corporation, and it might perhaps often prevent miserliness from being accepted as economy.

A GREAT deal of attention is given of late to the architectural character of streets in the Metropolis, but it would be an advantage if some attempt were made to regulate the character of the business which is transacted in the buildings. The terrible fire which burst out in Long Acre on Wednesday morning suggests the enormous risks which are unnecessarily incurred by the inhabitants of many parts of London. The street can be considered as a continuation of Piccadilly, and if care were exercised it would quickly become part and parcel of a most important thoroughfare. But some years ago the houses got into the hands of coachmakers, and it has become the centre of the industry. As a development, the making of motor-cars is practised in several of the buildings. Carriages are a class of goods which are not required at a moment's notice, for people do not buy broughams or motor-cars under the same circumstances as they buy hats or ties. But the report prepared by the Fire Brigade is almost appalling, from the number of premises which are found in Long Acre containing objects which are easily consumed and which would communicate destruction to other premises. There are not only factories and warehouses, but premises which are occupied by painters and other trades of a dangerous kind. Anyone who will examine the part of Long Acre and the adjoining streets which have suffered must come to the conclusion that if it were not for the energy of the Fire Brigade a colossal conflagration might still be raging. An industry of the kind should be followed in some one of the outlying districts of the Metropolis, and we do not believe that much inconvenience would be suffered either by those engaged in it or by the public in general if such a transference was compulsorily carried out.

THE purposes of the British Academy are not yet made evident. But a service was done to archaeology by allowing a paper to be read on Wednesday by Dr. HODGKIN on ERNST CURTIUS. His efforts to promote exploration in Greece are familiar to his countrymen, but they can hardly be said to have received due recognition in this country. It was to him mainly the excavations at Olympia are owing, and the results gave an impetus to the study of antiquity which was almost without precedent. ERNST CURTIUS was a typical German scholar. He went to Greece when young simply for the purpose of obtaining information which would be useful in his future studies. On his return he became connected with the University of Berlin, and was fortunate in obtaining the appointment of tutor to the Crown Prince, who afterwards became the Emperor FREDERICK III. His essay on the Acropolis of Athens is dated 1844, and during the successive years he brought out books connected with the archaeology and topography of Greece. Some of them were connected with the work to which he devoted himself, viz, the "History of Greece," of which the first volume appeared in 1857. Through his influence with the Crown Prince he succeeded in having grants assigned for the exploration of Olympia, which amounted to 30,000l. He was able to arrange that Germany should retain entire control of the work. The discoveries which followed, we need not say, have been revelations concerning Greek sculpture. CURTIUS died in 1896 in his eighty-second year.

THE WHISTLER EXHIBITION.

THE persistent zeal of his friends in endeavouring to compel the public to recognise the merits of the works of the late JAMES MCNEILL WHISTLER is remarkable, if not unique. Many artists of great merit have had to pass from life without adequate recognition, and they have left their cause with confidence to the judgment of posterity. But in the case of JAMES WHISTLER it seems to be decided that by securing the suffrages of the present time in his favour his renown is established. That, however, is a vain aspiration. Posterity will judge of things, whether they are buildings, pictures, statues or etchings, in its own way, and little regard will be given to the opinions which we may have had on those subjects. In WHISTLER's case there is, however, something amusing and consistent with his own efforts. He professed to believe that artists were beings apart, and that it mattered little to them what the public might think of their works. But he went through extraordinary efforts to attract public attention to himself and to all classes of his productions. To be unnoticed would be to him like living in a receiver from which all air was exhausted. The public were shrewd enough to recognise his anxieties, and enjoyed them. His friends, in the same way, are eager to anticipate the verdict of the amateurs of the future by holding one exhibition after another of his works.

That there are numerous champions on his side is evident. They would not, however, care to have it understood that their admiration went so far as imitation. The majority of them would make no scruple about acknowledging the shortcomings of his works. The reason for their loyalty is that WHISTLER represents revolt against ancient methods. He belongs to the American section who insist on independence whatever the cost. Artists who may exceed WHISTLER in revolting are therefore glad to use him as a symbol of their own aims and aspirations.

It is hard to judge of the works of a man who holds such a position in the same spirit with which those in ordinary exhibitions are scrutinised. To appreciate what is to be seen in the Regent Street Gallery it is necessary to assume for a time the artist's situation. WHISTLER was not a man who believed in a laborious systematic evolving of a picture or an etching. Like his favourite butterfly his operations were always brief. The butterfly does not exhaust all the juices of a flower, and WHISTLER was sufficiently logical to express no more than was possible with his peculiar method. It was the belief of HENRI TAINE that a book could be abstracted into three pages, and the three pages condensed into three lines. A treatment of a similar kind was adopted by WHISTLER. Some of the etchings, for example, consist of simply a few lines. They were sufficient to reveal the features which he thought the most interesting in the subject before him, and would no doubt recall to him many other details which were omitted. But it cannot be expected that they would be equally eloquent to strangers. We may endeavour by imagination to supply the shortcomings, and in that way some sort of complete subject can be created, but it does not follow that it will correspond with the subject which was before the artist. In other words, we may look on his representations as a kind of stenography, but as the system was his own it will be always doubtful whether we can properly interpret the characters. Whether hereafter people will be able to do more we do not presume to decide.

The exhibition in the New Gallery is undoubtedly representative. It contains examples of his paintings in oil, his water-colours, his pastels, his etchings, dry points and lithographs, together with various sketches and studies. The majority of them, regardless of size, correspond in apparently suggesting the mood of the moment when they were produced. There is no complexity, and we cannot believe that he took up the work after intervals of suspense. The treatment therefore corresponds with the lightness and decision of the

handling. WILLIAM COBBETT believed that his marvellously natural style of writing was owing to his resolution to never substitute one word for another, and WHISTLER's works all suggest that his strokes were never replaced. The Comte DE MONTESQUIOU relates that when WHISTLER was painting his portrait he used repeatedly to approach the canvas with a pencil full of colour without ever laying on the paint. He would draw back and take a larger or smaller pencil of which he made use. It was a revelation of the resolve that if the colour was once used it would have to remain, or that a stroke was not to be supplanted by another. The majority of people will say that neither COBBETT's nor WHISTLER's system merits to be universally accepted, but it is not to be expected that their writings or paintings will be identical with those by other writers or painters who followed a different process.

As the greater part of the examples consist of etchings, lithographs and studies, the effect at first is less impressive than in ordinary "one-man" shows. There are 767 entries in the catalogue, but only about a seventh of the number are paintings. It is not possible that very small etchings in white frames, and many of which are hung against a white cotton background, can produce much effect on the ordinary visitor. Only those who have already studied and discussed the various "states" of the etchings can be expected to give attention to those which have been lent. They are all interesting not only from the lightness and effectiveness of touch, but as records of various moods. Some are elaborated to an extent that suggests the work of a different artist, while others consist of the fewest possible number of lines. In fact, spontaneity might be said to characterise all the examples of WHISTLER's works which are on the walls.

The lithographs are not to be compared with the examples by French painters such as DELACROIX, DECAMPS, FRANÇAIS and others. They elaborated their drawings on stone by a systematic course which might be compared to painting, for there were many stages and the first bore little resemblance to the last. In that way the plates became masterpieces, not only of form but of light and shade. WHISTLER used paper for his chalk drawings and he was therefore limited in results. He was unable to express much contrast between black and white, and in some instances the work became defective, as if through chemical action in transferring to stone. But slight as are many of the plates, they demonstrate the accuracy with which he seized the characteristics of a subject at a glance.

Etchings and lithographs by WHISTLER have appeared in earlier exhibitions, but his nude studies will be novelties to the majority of visitors. He did not obtain much credit for knowledge of the figure, but his studies are in parts excellent. He had not the patience to seek correctness throughout, and they were all likely to be drawn quickly. The contours are, however, graceful, and the proportions just. Evidently his preference was for a slim type of figure.

In two of the rooms are the paintings, or, as they are described, "Nocturnes, Marines and Chevaux Pieces," oils, water-colours and pastels. Not many of them are adapted for reproduction, but the two which were made the subjects of prints, the *Portrait of Thomas Carlyle* and the *Portrait of my Mother*, which are hung on opposite walls in the West Room, are first to attract the notice of visitors. If more of the paintings were photographed the reputation of the artist would rest on a firmer basis. CARLYLE was a difficult subject, and neither WATTS nor MILLAIS succeeded with him. The most characteristic likeness of him was by a young American sculptor, but the bust never reached the marble or bronze stage. WHISTLER gave the expression of the old writer when he had been subdued after the death of his wife, and was suffering remorse for errors which were never committed by him. All the fierceness against shams has vanished from his face, and instead we have resignation to fate and

artist's will. The painting is open to the objection of having an excess of wall space which is of no advantage. The portrait of Mrs. WHISTLER, which was lent for the exhibition by the special decree of M. LOUBET, also suffers from the extent of the wall, but in this case one of her son's etchings hangs on it, and it has therefore some use. The reverential spirit with which the work was painted must strike everyone and disarm criticism. On the same wall is the portrait of PABLO SARASATE, which might be said to be in relief, although the violinist is in evening dress and the background is black. It belongs to the Carnegie Art Gallery, Pittsburgh. Sir HENRY IRVING as Philip of Spain is as sombre as the subject required, but there is a variation from the prevailing darkness in the gold embroidery, white silk lining of the cloak and the jewels. The fleeting fame of actors has been lamented by themselves and their admirers; it may be, therefore, an error to represent them with the solidity of REYNOLDS, LAWRENCE and MACLISE when they painted them in character. For suggesting evanescence there is no painter like WHISTLER, and indeed all his sitters became more or less ghostlike under his hand. He adopted a more substantial manner in the portrait of M. THEODORE DURET. But he was the first of the French writers to recognise WHISTLER's power, and he deserves to be shown as a strong and courageous man. Some other portraits are shown, under such titles as *Girl with a Red Feather*, the *Little Blue Bonnet* and the *Fur Jacket*. There are a few portraits of WHISTLER, but he treats himself with the same latitude as any of the ordinary subjects. The Piano Picture (portraits of Lady SEYMOUR HADEN and her daughter) which was painted in 1860, continues to be one of the most interesting in the collection.

The landscapes are numerous. WHISTLER never is reminiscent of an earlier master of the art. It is believed, for instance, that too much light cannot be cast on St. Mark's, Venice, in order to exhibit all the details. But here we have the building as a nocturne, and only dimly traced against the sky. *Old Battersea Bridge* is another nocturne, but the darkness is varied by fireworks. *Valparaiso*, although a night scene, appears enveloped in a pleasing light blue. No scenes are more effective than those which recall Cremorne, for they seem as if they were visions of a dream. The *Blue Wave* shows unexpected power and realism, but we have an explanation of its peculiarity when we find it described as "painted in company with COURBET when they worked together for one or two summers on the coast of France."

From the peculiar manner of his painting, by which colour was not superimposed on colour and chemical action was avoided, it was to be expected that WHISTLER's paintings would show fewer signs of age than those by ordinary painters. It must be allowed that in the majority of them the colours have stood well. Only in the *Old Westminster Bridge* and the portrait of Mr. IONIDES are there cracks in the paint. The former is an animated scene, for it represents the erection of the existing bridge which PAGE designed. It is curious that although the artist knew something of engineering he shows the first cast-iron arch as painted blue, a colour which is unknown in foundries. On the whole the exhibition is novel and merits attention even from those who will not accept the principles which inspire the works.

We must not, however, make more of the exhibition than it is worth. CARLYLE said in no place was so much insincerity displayed as in an art gallery. There are amateurs who can easily work themselves into enthusiasm about trifling things, and they are likely to find while the present exhibition is open. They will not realise that much of the work on the walls is erratic. A book is said to be a book although there may be nothing in it, and by conferring titles on the slightest things and drawings on transfer paper WHISTLER has made them "works of art" regardless of their nature.

THE POETRY OF ARCHITECTURE.*

IT is commonly accepted that JOHN RUSKIN's long period of authorship began in 1843 with the first volume of "Modern Painters," when the author was in his twenty-fourth year. But his manuscripts were familiar in printing offices much earlier. He was able to rhyme when he was quite a child, and at fifteen he contributed to "Friendship's Offering." He had reason to believe that he came into this world with a mission, and was endowed with means for its fulfilment. There were grounds for his belief. The father was an old-fashioned merchant who was not above acting as a commercial traveller, and on most of his journeys his wife and his only son were his companions. JOHN RUSKIN became familiar in that way not merely with a great part of England and Scotland, but with France, Germany, Switzerland and Italy. At an early age he was taught to draw. A love of nature, of buildings, of pictures, was soon developed in the precocious boy. He was taught drawing, and, as in other things, was expected to be exceedingly accurate. At a time when other children are not out of the nursery, he proposed the preparation of a book with plates engraved by himself. Of his attempts he said afterwards:—"I have never seen drawing by a youth so entirely industrious in delicate line, and there was really the making of a fine landscape or figure outline engraver in me."

When he was sixteen he began to contribute essays on geology and natural phenomena to *LOUDON'S Magazine of Natural History*. The editor was an industrious and enterprising Scotsman, who had practised gardening, but who was not satisfied with the superintendence of workmen. He wrote several books, and had established three or four magazines. The first number of his *Architectural Review* appeared in March, 1834. It was intended to attain the same purpose as his "Encyclopædia of Cottage, Farm and Villa Architecture and Furniture," viz. to diffuse among general readers a taste for architectural beauties and comforts, and to improve the dwellings of the great mass of society in all countries. Among his contributors were W. H. LEEDS, E. B. LAMB, GEORGE WIGHTWICK, E. TROTMAN, J. A. PICTON, J. ROBERTSON, G. DIAMOND, ROBERT MALLET, the engineer, G. COTTAM, I. J. KENT, and others who are still less remembered. It was a time when the Five Orders held sway, and when there seemed to be doubts about the applicability of Gothic for modern buildings. LOUDON could not be expected to be an adherent of any one style, for he realised there were fictions in all, except, of course, the "rustic." But he was anxious to see, as he said, our country residences as celebrated for their architecture as for their gardens and landscape scenery. He must have believed that Providence had sent him a true disciple in the young JOHN RUSKIN, who, although he was not partial to gardens and looked on the florist's flowers as leading a tormented life "in earth that they know not and in air that is poison to them," yet believed that nature, that is to say, landscapes, should be the source of inspiration for all who design buildings. Accordingly, in November 1837 there appeared in his *Architectural Magazine* an article entitled "Introduction to the Poetry of Architecture; or, The Architecture of the Nations of Europe considered in its Association with Natural Scenery and National Character." It was signed "KATA PHUSIN" (i.e. according to nature), and was written by JOHN RUSKIN, then in his eighteenth year. A year afterwards LOUDON expressed the character of the essays by admitting that they would afford little pleasure to the mere builder or the architect with no principle of guidance but precedent. They were not addressed to them, but to the young and un-

* *The Poetry of Architecture; or, The Architecture of the Nations of Europe considered in its Associations with Natural Scenery and National Character.* By John Ruskin, LL.D., D.C.L. With Illustrations drawn by the Author. (London: George Allen.)

prejudiced artist. It was added "there are some, we trust, of the rising generation who are able to free themselves from the trammels and architectural bigotry of VITRUVIUS and his followers; and it is to such alone that we look forward for any real improvement in architecture as an art of design and taste." It certainly was remarkable to find so young a writer attempting a subject which was supposed to be outside the capacity of an amateur. To become a censor at the age of eighteen is not desirable. But at that time, defects in building were so glaring they could not escape eyes which had compared fewer examples than JOHN RUSKIN'S. That he confounded particular instances with the general character was inevitable in so young a critic. Describing contemporary building he said:—"All unity of feeling (which is the first principle of good taste) is neglected; we see nothing but incongruous combination; we have pinnacles without height, windows without light, columns with nothing to sustain, and buttresses with nothing to support. We have parish paupers smoking their pipes and drinking their beer under Gothic arches and sculptured niches, and quiet old English gentlemen reclining on crocodile stools and peeping out of the windows of Swiss chalets." He did not, however, assert that all the responsibility lay with the architects. Their clients, he considered, were the dictators who insisted on having the utmost variety in their dwellings. He describes the manner in which instructions were given to architects in the following passage:—

He [the architect] is requested, perhaps, by a man of great wealth, nay, of established taste in some points, to make a design for a villa in a lovely situation. The future proprietor carries him upstairs to his study to give him what he calls his "ideas and materials," and in all probability begins somewhat thus:—"This, sir, is a slight note; I made it on the spot; approach to Villa Reale, near Pozzuoli. Dancing nymphs, you perceive; cypresses, shell fountain. I think I should like something like this for the approach; Classical, you perceive, sir; elegant, graceful. Then, sir, this is a sketch made by an American friend of mine; Whee-whaw-Kantamaraw's wigwam, king of the Cannibal Islands, I think he said, sir. Log, you observe; scalps and boa-constrictor skins; curious. Something like this, sir, would look neat, I think, for the front door, don't you? Then, the lower windows I've not quite decided upon; but what would you say to Egyptian, sir? I think I should like my windows Egyptian, with hieroglyphics, sir; storks and coffins, and appropriate mouldings above; I brought some from Fountains Abbey the other day. Look here, sir; angels' heads putting their tongues out, rolled up in cabbage leaves, with a dragon on each side riding on a broomstick, and the devil looking on from the mouth of an alligator, sir. Odd, I think; interesting. Then the corners may be turned by octagonal towers, like the centre one in Kenilworth Castle, with Gothic doors, portcullis, and all, quite perfect; with cross-slits for arrows, battlements for musketry, machicolations for boiling lead, and a room at the top for drying plums, and the conservatory at the bottom, sir, with Virginian creepers up the towers; doors supported by sphinxes, holding scrapers in their forepaws, and having their tails prolonged into warm-water pipes to keep the plants safe in winter, &c." The architect is, without doubt, a little astonished by these ideas and combinations, yet he sits calmly down to draw his elevations, as if he were a stonemason or his employer an architect, and the fabric rises to electrify its beholders and confer immortality on its perpetrator.

RUSKIN declared there was no exaggeration in his account, but we cannot imagine that in 1834 any ordinary client would be so absurd as is represented. The author could have had few opportunities of discovering how business was transacted, and he must have drawn on his imagination for the interview.

In order to explain the absence of that unity which was desirable as the basis of grace and the essence of beauty, RUSKIN proposed to begin by a comparison of cottages in England, France, Italy and Switzerland. Then to compare British and foreign villas, and subsequently to treat of residences of a more important kind.

But as the magazine ceased to exist in 1838 the series was never completed. The articles may therefore be considered as forming a prologue to "The Seven Lamps" and "The Stones of Venice," in which the subject was treated with a more matured judgment, but not with a greater respect for nature.

When proposing a reform in architecture the simplest and most practical way of suggesting the critic's ideas is to prepare designs which can at once appeal to the judgment through the eye. In 1837 RUSKIN was a better draughtsman than the majority of amateurs in England. Then, however, as in subsequent years, he was without any power as a designer. In spite of all his industry and enthusiasm in studying buildings and his wonderful knowledge of the details of many of the principal examples in Europe, he had to endure the infirmity of being incapable of preparing a design, and there is not the simplest building or artistic object which the world will care to preserve because it was his work. When he was allowed to co-operate with others, as in the museum at Oxford, the result was most unsatisfactory. It might be supposed that in his young days his courage would have led him to attempt a design in order to emphasise his words. But the illustrations which appeared in the text were derived mainly from foreign structures. In that way he differed from the majority of the contributors to the *Architectural Magazine*. Their projects were not masterpieces, and, according to modern standards, some of them are very amusing. But they at least enable us to judge of the value of the designs, whilst of KATA PHUSIN'S proposals we can only have the vaguest notions. Indeed, it might easily be supposed that his articles were addressed to landscape-painters, and were simply suggestions about the kind of buildings which it was desirable to introduce into their paintings or drawings.

As we have remarked, he treats only of cottages in country districts. The country he divides into three classes: the cultivated, or blue; the wild, or grey; the hilly, or brown. The division, he allows, has to be liberally interpreted, blue Italy being very different to blue England. Architecture should depend on its situation in one of the divisions, and thus in the landscapes of CLAUDE, SALVATOR ROSA and POUSSIN the horizontal lines and simple forms of the Ausonian villas are employed with great success. The groups formed by Italian villages in general become beautiful by the respect which is shown for the curves of the landscape. We have also a passage about the relation between buildings and national character, which exemplifies the peculiar if imaginative power which was afterwards to be exhibited in many of his references to Italian ways in former times:—

Thus much for the mere effect on the eye. Of correspondence with national character we have shown that we must not be disappointed if we find little in the villa. The unfrequency of windows in the body of the building is partly attributed to the climate; but the total exclusion of light from some parts, as the base of the central tower carries our thoughts back to the ancient system of Italian life, when every man's home had its dark, secret places the abodes of his worst passions; whose shadows were alone entrusted with the motion of his thoughts; whose walls became the whitened sepulchres of crime; whose echoes were never stirred except by such words as they dare not repeat; from which the rod of power or the dagger of passion came forth invisible; before whose stillness princes grew pale, as their fates were prophesied or fulfilled by the horoscope or the hemlock; and nations as the whisper of anarchy or heresy was avenged by the opening of the low doors, through which those who entered returned not. The mind of the Italian, sweet and smiling in its operations, deep and silent in its emotions, was thus in some degree, typified by those abodes into which he went to retire from the tumult and wrath of life, to cherish or to gratify the passions which its struggles had excited. Abodes which now gleam brightly and purely among the azure mountains and by the sapphire sea, but whose stones are dropped with blood; whose vaults are black

with the memory of guilt and grief unpunished and un-
 venged, and by whose walls the traveller hastens fearfully
 when the sun has set, lest he should hear, awakening again
 through the horror of their chambers, the faint wail of the
 children of Ugolino, the ominous alarm of Bonatti, or the
 low cry of her who perished at Coll' Alto.

The theory that architecture was expressive of life,
 with, policy, was afterwards treated at length in "The
 Seven Lamps," and a large part of "The Stones of
 Venice" is made to exemplify it. There is interest to
 find the germ of it in an essay by a writer so young.
 If the theory is accepted, it must follow that the form
 of building which is adopted by a people at one time
 will not necessarily serve their purposes at a later time,
 and still less will be adapted to those of a different
 race. In 1838 "Elizabethan" possessed popularity as
 a style, and JOHN RUSKIN found little difficulty in
 finding correspondence between it and his principle.
 Describing a mansion of which a woodcut was given,
 he said "it is a humourist, an odd, twisted, inde-
 pendent being, with a great deal of mixed, obstinate
 and occasionally absurd originality." It resembled
 English character; it was thoroughly domestic, "spark-
 ing in its casements, brisk in its air, letting much
 light in at walls and roof, low and comfortable-looking
 at its door," regularly planned, &c. He would permit
 grotesque ornament, but not in the garden, for he
 says:—

Though the grotesque of Elizabethan architecture is
 adapted for wood country, the grotesque of the clipped
 garden, which frequently accompanies it, is not. The
 custom of clipping trees into fantastic forms is always to
 be reprehended: first, because it can never produce the
 true grotesque, for the material is not passive and, there-
 fore, a perpetual sense of restraint is induced while the
 great principle of the grotesque is action; again, because
 we have a distinct perception of the two natures, the one
 neutralising the other, for the vegetable organisation is too
 palpable to let the animal form suggest its true idea; again,
 because the great beauty of all foliage is the energy of life
 and action, of which it loses the appearance by formal
 clipping; and again, because the hands of the gardener will
 never produce anything really spirited or graceful. Much,
 however, need not be said on this subject, for the taste of
 the public does not now prompt them to such fettering of
 fair freedom, and we shall be as sorry to see the character-
 istic vestiges of it, which still remain in a few gardens, lost
 altogether, as to see the thing again becoming common.
 The garden of the Elizabethan villa, then, should be laid out
 with a few simple terraces near the house so as to unite
 it well with the ground; lines of balustrade along the edges,
 guided away into the foliage of the taller trees of the garden
 with the shadows falling at intervals. The balusters should
 be square rather than round, with the angles outward, and
 if the balustrade looks unfinished at the corners, it may be
 surmounted by a grotesque bit of sculpture of any kind, but
 it must be very strong and deep in its carved lines and
 must not be large, and all graceful statues are to be avoided

"The Poetry of Architecture" enables us to judge
 of the qualities with which JOHN RUSKIN was endowed
 by nature, for in his nineteenth year he was still under
 parental control and had not come into collision with
 the world. We find he was not only a keen observer,
 but a reasoner. He might be supposed to have devoted
 attention mainly to the phenomena of the material
 world as if in preparation for the investigation of
 landscape art. But the essays testify that he was not
 indifferent to "the still, sad music of humanity," and
 when speculating about the fitness or unfitness of a
 house for a site, he also thought about the occupiers.
 There is much in the book which now can be considered
 as fateful, for it reveals what the writer was to become
 when his ebullient sympathies dashed against doctrines
 which were as ill-adapted to the times as the Vitruvian
 conventions. RUSKIN will be better known in his
 strength and weakness when "The Poetry of Archi-
 tecture" is carefully studied.

Mr. Thomas Blashill, architect, Tavistock Square, London,
 has left property valued at 11,269/.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on
 Monday evening last at Conduit Street, Mr. John
 Belcher, A.R.A., president, in the chair.

Mr. ALEX. GRAHAM (hon. secretary) announced the
 decease of Mr. James Barnet, of Sydney, New South Wales,
 Fellow, elected 1886, and Mr. James Thomson, Fellow, of
 Glasgow. Mr. Thomson was the architect of many im-
 portant buildings in Glasgow, and was twice president of
 the Glasgow Institute of Architects.

The PRESIDENT offered the congratulations of the Institute
 to Mr. Blomfield on his election to the membership of the
 Academy. They all admired, he said, the work of Mr.
 Blomfield, and recognised the zeal he had displayed in
 architectural training, evidenced by his attending the
 meeting to read a paper on that subject.

Mr. REGINALD. BLOMFIELD, A.R.A., read a paper on

Architectural Education.

The subject of architectural education, he said, had long
 engaged the attention of all thoughtful architects. Notwith-
 standing the increasing tendency to develop school training,
 and the improvements that had been made in it, the pupillage
 system had, in the main, held the field. No successful
 attempt had been made to bring it into relation with the
 schools and to co-ordinate the various methods of training
 in use in the latter. It was highly important that a pupil,
 before entering an architect's office, should have gone
 through such preliminary training in the schools as would
 enable him to get his bearings in the office without waste of
 time. Hence they had to consider how the student should
 be started in his course of architectural training, what sub-
 jects he should study and how they should be taught. To
 arrive at clear ideas on this matter it was necessary to
 define what was wanted in an architect.

Architecture is the art that translates construction into
 beautiful forms; the architect, therefore, must master the
 principles and methods of construction before he can trans-
 late them. His real technique consists of the mastery of
 building processes: these are the true vehicle for the
 expression of his imagination. Another highly important
 matter is the possibilities of new methods of construction.
 Steel and iron render possible feats of construction which,
 on economic grounds alone, are irresistible; and it is the
 architects' business, as artists of form, to study steel and
 ironwork in order to develop out of its practical use methods
 of construction which have a beauty of their own in their
 adaptation of means to ends. The architect's training
 ought to enable him to take this matter up where the
 engineer is compelled to leave it through want of training
 in form and lack of artistic imagination.

Dealing with the unsatisfactory condition of architectural
 education the paper summarised the chief defects of the
 present system of schools as (1) faults of syllabus; (2) faults
 of teaching method; (3) the absence of co-ordination, re-
 sulting in waste of resources and loss of driving power.
 Two years ago some informal conferences of architects were
 held to discuss the situation; and finally, at the invitation
 of the Royal Institute of British Architects, a Board of
 Architectural Education was formed to consider the whole
 matter. The conclusions arrived at by the Board were
 embodied in a report which, together with a syllabus, had
 been provisionally adopted. Five points were dealt with, viz.
 (1) Preliminary education; (2) the length of the proposed
 course; (3) the syllabus of training; (4) the laboratory or
 workshop for training in practical work; (5) the steps to be
 taken to initiate and administer the scheme.

As regards (1) preliminary education, it is a difficult
 matter to assess the exact amount of general education
 necessary to an intending student of architecture. A student
 may have great natural aptitude for architecture, but little
 aptitude or little opportunity of acquiring the knowledge
 usually given by a good general education. The Board
 consider it best not to impose any preliminary test for
 admission to the architectural course, but to leave it to the
 individual training institutions themselves to lay down the
 amount of preliminary education they severally consider
 desirable. The Board, however, consider that evidence
 should be shown of some capacity in drawing, both
 geometrical and freehand.

2. For the length of the proposed course, the Board
 recommend four years as a minimum—the first two years
 to be spent in the schools, the last two in an architect's
 office. The object of this is twofold: first, to enable the
 student to master his rudiments in the schools, in order
 that when he enters the architect's office he may know how

to learn, and get the full advantage of his opportunities in the office; secondly, that in view of the pupil being partially trained, architects may be disposed to take pupils at a lower premium, and parents and guardians may not be put to a greater expense than they are under the present pupilage system. The pupil should continue his studies in the schools during his term in an architect's office. The preliminary course must of necessity be rudimentary, and should be supplemented by more advanced studies under his old teachers during his last two years. His studies will thus be pursued on a consecutive system, and under competent supervision from first to last. It is suggested that, on the completion of the course, a certificate should be granted to the student in consideration of satisfactory progress and capacity as proved by his work in the schools, and by a study of some architectural project, to include working drawings and specifications, and an analytical account of the nature and intention of the project. This study would be on the lines of the thesis submitted for degrees in certain university courses. The certificate would be endorsed by the architect with whom the student had served his time.

3. The first step towards standardising the different systems of training would be the adoption by the schools of a common syllabus. The syllabus proposed by the Board rests on the general principle that construction is the basis of architecture, and the correlative principle that architecture is the interpretation of construction into forms of æsthetic value. In drawing up this syllabus the Board have been guided by the following considerations:—(1) That it should be thoroughly practical, stress being laid on the teaching of construction as the basis of architecture; (2) that it should not attempt too much, that is, should not overload the student with a vast array of subjects, but should cut down those subjects to the essential and irreducible minimum, and insist on the student obtaining a thorough mastery of the subject as far as he goes. The following is the syllabus proposed by the Board:—(1) Building materials; (2) construction, including (a) applied mechanics, strictly in practical relation to construction, and (b) the practical methods of the building trades; (3) architectural drawing, including working and freehand drawings, solid geometry and measured drawings of historical examples of architecture; (4) geometrical projection and rudimentary perspective, this latter to be studied as an aid to the shaping and modelling of buildings, not as a means of elaborating architectural drawings; (5) design and the history of architecture as supplemental to and elucidatory of the study of construction. These subjects would be taught by classwork in the schools and by demonstration in the laboratory or lecture theatre of practical work.

4. The laboratory or workshop for training in practical work is an essential feature of the scheme. The demonstrations given in the laboratory would be in intimate relations with the lectures given in the classrooms of the schools, and the course would be arranged so that training in the classrooms and in the workshops should proceed together. The author explained that there was no idea of using these workshops for the purpose of turning the student into a skilled plumber or mason or whatever the trade may be. The object was to enable him to see with his own eyes, and if necessary handle with his own hands, the various materials and processes employed, in order that when he had to direct these processes himself in after years he might have actual knowledge and realisation of what he was doing. The author thought there was a little too much of the dilettante and the fine gentleman about the modern young architect. He would do better if he took off his elegant frock-coat and set to work in his shirt-sleeves.

5. With regard to the steps to be taken to initiate and administer the scheme, these must to some extent be tentative at first. The scheme could only be got under way by the goodwill and co-operation of the various educational bodies concerned, and it was proposed to submit the scheme and its syllabus to recognised architectural training institutions, and to invite them to adopt it. Where engineering schools exist side by side with architectural schools, as in some of the modern universities, the student should avail himself as far as possible of the training there given, but, generally speaking, it was proposed to invite the county councils to place their technical workshops at the disposal of recognised training institutions for purposes of practical demonstration.

In concluding his summary of the proposals the author said that in recommending the adoption of a uniform system and syllabus, the object the Board had in view was

to reinforce education, to enlarge its opportunities by bringing the schools into touch with one another, so that, for example, their united resources might admit of lectures and demonstrations on a level beyond their attainment individually. The last thing the Board had in view was the establishment of a rigid and inelastic method of training; their aim was the co-operation of the schools in a scheme adopted by them all. It was proposed that the Board of Architectural Education should act as a central advisory body to the several schools, with power to direct the administration of the scheme by means of visitors, who would report to the Board on the work done in the schools. The future constitution of the Board had not yet been determined, but endeavour ought to be made to make it as representative as possible of the profession generally. It was for architects to put their house in order, to prove by visible evidence throughout the country that the practice of architecture is an affair of real skill and solid knowledge; that the architect from his point of view is an expert in building every bit as much as the engineer is from his. When the public realised that to spend their money on building to the best advantage they must go to the architect as the man who really knew his trade, they would readily accord them the recognition due to men of special knowledge and admitted ability in their own calling. The first step to this desirable end was to see to the training of their students; that they, at any rate, should master the technique of the great art of building. So should they prepare the way for the return of architecture to her rightful place as the mistress of the arts.

Sir ARTHUR RÜCKER said he took it as a great compliment to the University of London to be called upon to propose a vote of thanks to Mr. Blomfield for his admirable paper. He felt reluctant in addressing such a meeting, but as architecture combined both science and art, and he had all his life been a devotee of real science, he might be allowed to say a few words. No man in the room felt more strongly than he did that if the great movement in education was to have a sound foundation, it was absolutely necessary that it should be carried out by those who were themselves the professional members of the great professions and trades which they wished to carry to a higher point of education. It was absurd for non-professional men to set themselves up to dictate what should be done in training the student in all such matters. It was, therefore, with the greatest delight that he saw a great profession taking up the whole question of architectural education from a practical point of view, and if the organised educational bodies could give any help by their knowledge of teaching and the like he hoped the profession would regard it with favour. It was a matter of the greatest possible importance that the universities should not stand aside and merely look on while those great movements were going on around them. In carrying out the scheme which had been proposed he hoped they would not merely do what they could to place the young architect in a separate architectural school and office, but where possible would allow him to be educated in an institution where he could mix with men of other professions. He would like them to remember that after all it was a matter of the very greatest importance that young men of different professions should so far as possible and within reasonable limits be brought up side by side, for it was not a good thing that the individual members of a profession should become members of a caste. Friction of mind against mind was the great benefit of the work at the universities. Such a training broadened a man's views and increased his resources, and if this could be done—and perhaps it could be done—only by the co-operation of the universities, it was well to accept their aid. He thought the university might be able to do something to provide that mixture of ideas that was so essential to the professional man. He was surprised when first he came across the word uniformity in the proposed scheme, because he would have very much regretted had they issued a mandate to the world that architects were to be brought up under a uniform system. From what he had heard this was not the purpose of their system, which was to be of gradual growth. He hoped they would regard the university as a friend in matters concerned with the improvement of education, and that they would recognise that the University of London was working side by side with them to prevent waste in co-ordinating education, and to do as much as they could with the limited means at their disposal to make architectural students worthy members of a real constructive profession.

Sir ASTON WEBB, R.A., in seconding the vote of thanks, said he found himself in agreement with the views expressed in the paper. It had been his pleasure for some time to work with Mr. Blomfield on the Architectural Education Board, and he was only saying what all the members of that Board felt when he stated that they were all indebted to Mr. Blomfield and to Mr. Slater for the enormous amount of time they had given to the work. He thought the meeting would agree that it was proper and fitting that the Board should at that stage of their inquiries have Mr. Blomfield to explain the position to which they had been able to bring their work. The matter of architectural education was one in which they as architects might unite and work together for the one object that those who came after them could have greater knowledge than they had had. They felt the disadvantages under which they had carried on their work, and were endeavouring to remove those difficulties which were unnecessary. They were not attempting a cast-iron scheme, but one which could be altered when any improvements were suggested.

Mr. H. H. STATHAM said the tone the lecturer had adopted in speaking upon the importance of practical knowledge was very much needed in the present day, and he hoped Mr. Blomfield's effort would have its effect. He was a little sorry to hear something like a slur cast upon the French system and the Prix de Rome work. The French appeared to be taught that plan and design must go together, and there was no doubt that they were right. At the Paris Salon plans and elevations of buildings were shown in drawings of the same size, but in the Academy the plans were small compared to the elevations.

Professor SIMPSON said there was one little point in the paper he wished to be allowed to refer to. Mr. Blomfield had stated that there had been no serious attempt between the schools to bring the pupilage system into accord with the training of the student. He could not speak for a certainty of all schools, but he fancied there had been more done towards that end than Mr. Blomfield had implied. At Liverpool it had been done, and it worked satisfactorily. He thought he could claim that there at least the pupilage system and the course in the schools were brought into direct relation with one another.

Mr. T. G. JACKSON, R.A., thought nobody could doubt that there was room for improvement in architecture, and that until the middle of the last century no attempt had been made to do better work. Then out of ten buildings erected nine would be bad. There never was a time when there was such a large proportion of inartistic work, he might almost say base, and there was a great deal of that kind of work going on in the present day. There was a commercial architecture which disgraced the streets, and the question was how to alter it. Amongst the rising architects there was great promise of good work, and one could notice in their buildings a growth of a feeling of restraint and reasonable design very different from the kind of work he had alluded to. Their aim must be to bring the whole class of architecture up to the same standard of those who were the future hope of the profession, and the keynote was that architecture should be based on constructive principles. This meant that architecture was founded upon reason and common sense, and that the development of the art in the past would be found to have arisen from suggestions of construction, difficulties of materials and appliances, which had been the most powerful means of inspiration to the architect. He was glad to see there was to be no fixed test to the course of study, and he trusted that the scheme which had been proposed would be as useful to builders and engineers as it would be to those who were more strictly constructive architects. After all, the results depended upon the student, and though they might provide the best education, they could only hope thereby to place facilities in his way for achieving better work.

Messrs. John Slater, Maurice B. Adams, E. M. Gibbs, G. A. T. Middleton, H. C. Corlette, H. G. Ibberson and E. Woodthorpe also joined in the discussion.

The PRESIDENT, in putting the vote of thanks to the meeting, said the remarks they had heard from the different speakers would clear the ground when the scheme of the Architectural Education Board came before the members for approval.

Mr. BLOMFIELD replied, and the meeting terminated.

The Bust of Charles Garnier, which has been placed against the exterior wall of the Louvre, is to be gilded at the expense of an anonymous admirer of the artist.

ACADEMY LECTURES ON SCULPTURE.

IN the last of his series of six addresses at the Royal Academy Mr. Gilbert referred briefly to the general motive of his preceding address, which was the discussion of sculpture not so much from a didactic point of view as from the point of view of moral influence, and then, speaking specially to the students, he touched upon the difficulties of the artist's life. The days, he said, fortunately were gone by when great exponents of art were looked upon as people with no fibre, as nothing more than ministers to the pleasures of the few people who could afford to possess and to delight in their efforts. As a fact, art was really the most masculine of callings, and took much more than any other out of the men who professed it. And the artist undertook the hardships of his calling, not under pressure, as the soldier does, who might be shot if he refused, but because of the conviction of his one desire to humanise and beautify the world. The sculptor's share in the great fabric of art is an onerous one. He has to look for beauty everywhere, and in reproducing his fellow-man to try and show him to be such as Phidias would have liked for a model. He must give not merely his model's proportions, he must look through him, and try to hand down to future ages a transcript of all he thinks beautiful, and not the small blemishes of human flesh. He must do nothing unworthy. It was no excuse to say that he must live, for there was no need for him to live if he did unworthy things. Nor was there any need for the sculptor possibly to injure his work by getting it done by a certain day lest the client should fall foul of him. Those who would fall foul of the sculptor for doing his best were not worthy to be his clients; and if a thing did not satisfy him the artist should begin it again, for he would have an unhappy life if he let unworthy things exist. "There are places," declared Mr. Gilbert, "where I dare not show my face because they contain some of my earliest efforts." It did not matter whether the artist when he died left one work or a hundred, but he ought to leave to the world something that would carry on in it his own individuality—a little writing on the wall, just as the painter of the wonderful *Jean Arnolfini and his Wife*, in the National Gallery, wrote above the mirror in the background of his picture, "Johannes de Eyck fuit hic," or "John van Eyck was here." The artist should never mind praise or censure; both should fall off him as lightly as water from a duck's back. What did it matter to him what anybody said the day after his work had been exhibited?

Referring to the general tone of his addresses, Mr. Gilbert, according to the *Morning Post*, said that he had been blamed by some of his friends for not being sufficiently "plastic" in his remarks. But plastic had two meanings, and he thought in a sense he had been plastic-elastic enough. He had been so elastic that he had been blamed again for overstepping the boundaries of the sister arts instead of confining himself to sculpture. But to him all arts were one family, and he had purposely tried to deal as widely as possible with sculpture, because it depended so much upon the influence of the so-called "sister-arts." He wanted to say something to them about inspiration, although it was hardly a matter upon which any mortal—and least of all such a poor one as himself—ought to speak. He felt that he could not define inspiration, and it was not easy to recall any specimen of art illustrating that enormous word. Looking back, though, he could see it in the untutored work of Giotto and in that of Donatello and the Della Robbias. No one could doubt, too, that Turner was inspired. Adaptability was another quality he wanted to mention in this last address. He wished to impress upon the students that adaptability did not mean that they should allow themselves to be called from their path to copy a prevailing fashion in art. They must bear in mind that they were to have nothing to do with new movements, new art or new anything else. Sometimes a moment would come when it seemed impossible to surmount difficulties, a moment when they might ask themselves, "Am I doing what is right? Am I not a little bit antiquated, and had not I better follow So-and-so?" No, they must keep always to their own path. It was a narrow path, and at the end was a tall ladder with lots of room at the top but a tremendous scramble to get up, and if they got up the first thing they must do would be to extend a helping hand to those still on the lower rungs. Charity and love were essential to the artist. The good artist never was a bad man and the bad man never was a good artist. Memling, for instance, repaid six weeks' succour by the monks of St. John's Hospital, Bruges, with the labour of six years.

NOTES AND COMMENTS.

IN the article we wrote about the Brighton Wood-Paving case, when judgment was given for the contractors by Mr. Justice GRANTHAM, we suggested that many things are done for the protection of Corporations which are not allowed for individuals. But we asked whether it was wise for the Brighton Corporation to undergo further expenses. Finally it was said:—"If it should happen that the contractors are to go unpaid the public will not be disposed to place any higher value upon the infallibility of the Corporation or upon the excellence of their system of conducting public works. It is not an advantage either for public bodies or for individuals to acquire a reputation for unfairness." In the Court of Appeal the Master of the Rolls, with Lord Justice MATHEW and Lord Justice COZENS-HARDY, adopted the same point of view. At the beginning of the hearing Mr. MOULTON was forced to admit that counsel's assumption was the action of the surveyor could not bind the Brighton Town Council. Whereupon the Master of the Rolls exclaimed, "Now, the murder is out." The Master of the Rolls also insisted on another point which we raised, that in one part only superficial measurement was adopted while in other parts the cubic quantities were given. Lord Justice MATHEW summarised the proceedings by saying, "The whole thing came to a deadlock, and it comes to this. The Corporation said, 'We won't pay.' The contractor said, 'You ought to pay'—litigation. Isn't that all?" The animus of the Court was so evident that on the third day the Brighton Corporation suddenly withdrew their appeal. The terms were not mentioned in Court, but it is known that the sum of 17,500*l.* will have to be paid the contractors, Messrs. MACARTNEY, McELROY & Co. Then there is the important question of costs. The whole case arose out of carelessness in the preparation of documents and the desire to obtain work below its cost, regardless of the loss which would have to be borne by the contractors whose work was faithfully performed.

ACCORDING to Herr MUTHESIUS, Germany and Japan were the most successful countries in the section of industrial art at the St. Louis Exhibition. Germany, he considered, made the most favourable impression, especially on the Americans. They were willing to purchase the libraries, dining-rooms, music-rooms, bedrooms designed specially for St. Louis. Herr MUTHESIUS received from the exhibition as a whole a more favourable impression than he had anticipated from the articles in the journals. The exhibition buildings were effective although they were only erected for temporary purposes. Germany recognised the importance of the American market and made efforts to secure it. The visitors found that the Empire was able to compete with France. In such estimates an official usually becomes an optimist. Great Britain took part in exhibitions in the United States and on the Continent of Europe, and found the actual advantages were to be easily counted, although reports might easily be interpreted as indicating a large amount of profit to the exhibitors.

It is rarely we find it stated that railway companies are indifferent to their own interests and charge contractors diminished weights when carrying building materials. A curious case relating to the subject has been tried in the Scottish courts before Lord Low. A firm of carriers brought an action against a firm of building contractors, and counter actions were brought by the builders. Messrs. M'LACHLAN entered into a contract to carry out the masonry, brickwork and iron-work at Stobhill. They also contracted to have the carting done by Messrs. MARSHALL & Co. Messrs. M'LACHLAN claimed that they were charged in excess. The carriers pleaded that the actual weights of the

materials—bricks and sand—were largely in excess of the railway weights, for the companies habitually understated the weights of such materials as bricks and sand. His Lordship said he could not understand such a statement unless in cases when, after the weights had been taken by the railway officials, the bricks or sand were exposed to rain and became saturated with moisture, which added very considerably to their weight. That, however, was a fact which must be well known to carters, and which, it must be assumed, they took into consideration in agreeing to cart the goods from a railway station at so much per ton. His Lordship therefore resolved to adopt the weight ascertained by the railway companies as a standard. Judgment was given in favour of Messrs. M'LACHLAN for 794*l.* and for the carriers for 142*l.* The case may suggest to other contractors the necessity for overhauling their bills for carriage.

ILLUSTRATIONS.

CHURCH OF ST. THOMAS THE APOSTLE, HOVE.

THIS new church at Hove, on the outskirts of Brighton, is intended for the large and rapidly increasing district now being opened up on the northern part of the Goldsmid Estate, where houses of an attractive class are being erected in great numbers. The building, as the illustration shows, will be of a dignified and simple character, relying for its effect upon plain surfaces and a wide and lofty nave. The site, which is a prominent and central one, has been generously given by Mr. D'AVIGDOR GOLDSMID, and the building committee, under the chairmanship of the newly appointed vicar of the parish, the Rev. WALTER MARSHALL, M.A., have decided to proceed slowly but continuously with the erection of this fine church at an estimated cost of 12,000*l.* The architects are Messrs. CLAYTON & BLACK of Brighton.

A STREET IN LOCHES, TOURAINE.

THE ancient castle of Loches, from actual history as well as from the romance with which tradition has surrounded it, absorbs so much of our interest that we are apt to forget that there are a few objects in the old town itself which may well command our respect both as historical monuments and as remnants of the architectural art of both Gothic and Renaissance periods. The town gates, for instance, are imposing enough as examples of that class of architecture which, while serving the peaceful object of admitting friends, has also to fulfil the grim purpose of defence against foes. Of the gates of Loches, the northern—the one shown in Mr. HAIG's sketch—is perhaps less successful, architecturally, than the eastern one—that which opens towards the road from Beaulieu, but when seen from the interior of the town, it will strike anyone who beholds it for the first time as a more grand and uncommon structure, especially when taken in combination with the Renaissance Hôtel de Ville, which, in its feminine gracefulness, forms an appropriate contrast to the manly strength of the gate-tower. Faithful companions since the year 1535, when the Hôtel de Ville was completed, these two venerable structures have grown grey and timeworn in the service of the town, and fitting is it to observe that, whereas the morwarlike building has many a distinct scar and memento of furious war, the more delicate one has been comparatively spared. They have both done good service and it is pleasant to see that the town in return does try to care for and preserve the veterans.

MOUNT STUART, ISLE OF BUTE, N.B.: THE CORRIDOR.

THE COTTAGE, BOSCOMBE.

CHURCH FITTINGS.*

(Concluded from last week.)

THE next items in our list are screens, the rood-loft and the rood, all of which we may consider together.

During the fifteenth century screens seem to have been erected in most churches to enclose the chancel and chapels, and elsewhere. Some still remain unrestored (long may they remain so). They are quite exquisite in line, in detail, in sentiment and in workmanship. Richly ornamented with carving and painting, they are among the most beautiful works of art that Englishmen have produced. They have suffered frightfully, first at the hands of puritan fanatics, and then by the blind neglect and stupidity of eighteenth-century protestantism, and last, but not least, most of those that escaped or survived these two causes of destruction have been stripped of their colour and so "improved" by well-meaning but mistaken "restorers" that but little of their beauty remains. Enough, however, remains to make me, for one, exceedingly wroth with the sacrilege that destroyed them and the stupidity that restored them. But enough remains also to teach us, to inspire us and to guide us. May I beg all here to move heaven and earth to preserve these priceless relics that still remain from further destruction or restoration. They will remain a very long time yet if proper care is taken of them.

On top of the screen separating chancel from nave, and supported by it, ran the rood-loft, reached by a winding stair. The rood-loft was used as a minstrels' gallery. It was customary for strolling minstrels to be hired on great festivals. Parts of the service were occasionally sung from the rood-loft, but not the Epistle and Gospel.

The rood itself, a large cross with a figure of Our Lord carved or painted upon it, and generally the figures of St. Mary and St. John, stood upon the roof-loft, or was suspended over it from the chancel arch. Sometimes other figures of saints and angels were added, and upon the loft many candles were put. There are reasons for and against a chancel screen of a theological kind, which do not concern us now. Such screens are beyond doubt among the ornaments of the rubrick, and they add greatly to the beauty of a church. Screens are generally required by the authorities to separate a chapel from the rest of the church. It is questionable whether a rood-loft should be put nowadays, unless it is required for a practical use, which will only be the case in some churches. We no longer engage strolling minstrels who have to be put where they cannot get at valuables, in case they should be tempted to steal. All too few of our churches, however, have anything worth stealing.

Screens may be made of stone, wood, or metal, or a combination of any two or all three of these materials. On the whole, I think wood is the best of the three, but that may be because I have a particular affection for woodwork.

There are a few conditions that should regulate the design of a chancel screen. The clergy stalls ought to return against the chancel side of the screen, therefore the lower part must be panelled with solid panelling to a sufficient height to form the back of the stalls, from 3 feet to 4 feet from the chancel floor. It is undesirable to block the view of the altar from the congregation, and unless it is raised on several steps, a high solid base to the screen would do so. If the chancel is long enough to allow of such an arrangement, it looks well, I think, for the chancel floor to be only one step above the nave and for the sanctuary to be raised three more steps beyond the choir seats, leaving enough space at the east side of the choir seats for easy access to them on their own level, say 2 feet 6 inches or 3 feet wide. It is awkward for the members of the choir to have to step down to reach their places. Thus, two steps with a tread of 12 inches each would ascend from the level of the chancel to a space at least 4 feet wide for the communicants; then one step more to the level of the sanctuary floor. A space of at least 5 feet 6 inches must be allowed before the next step rises. (The altar rail, if there is to be one at all, should be set 18 inches back from the front edge of communicants' step, leaving a width of 4 feet within.) Then two more steps, each 18 inches wide, and a foot space in front of the altar 3 feet wide, making a total length eastwards beyond the choir seats of 18 feet 6 inches or 9 feet to the front of the altar. The altar itself would be

raised seven steps above the nave, say, 3 feet 6 inches or 3 feet 9 inches, in the former case all steps having a rise of 6 inches, in the latter the first four having a rise of 6 inches, the last three 7 inches. The screen would be fixed on the first step, and the panelled base might be 3 feet 6 inches high, without hiding the altar. In my opinion the central opening should be nearly as wide as the altar, 7 feet or 8 feet in, a narrow church, and more in a wide one. It is well, I think, to have as few mullions as may be, and for them to run up a considerable height before the more intricate and ornamental part of the screen begins. Where a loft is not required, I think a strong horizontal line looks well at top, with or without a cresting. In churches where there is no chancel arch, I see no reason why the screen should not run up and be framed into the timbers of the roof, with the rood and any other figures worked into the design of the screen itself. In spite of the long tradition there is for standing figures on top of the screen, more or less isolated, I must say I feel that, if they could be joined on or worked into the design of the screen, it would have a better decorative effect—amongst other reasons, no doubt, because the figures must be less realistic to take their proper place in the whole. In some churches, especially where the chancel is narrow and there is a chancel arch, a high screen may not look well. In such cases a low screen of stone or wood is wanted to stop the return stalls. The rood may then stand upon a beam, in which case I think it is better to have a little ornament of some kind to connect it to the beam. Or it may be suspended in the arch, which is, I think, the better way. In either case a cloth of suitable colour hung behind helps the decorative effect. I think the rood should not be too plain, whether or not figures be added—it is, as I have said, the standard of the Christian army, the symbol of self-sacrifice, rather than the cross of execution.

Gates may be added either of wood or metal, and in churches where valuable or holy things are kept in the chancel they are most desirable, to prevent theft or sacrilege. In such churches a strong but very light metal grille should be fixed between the mullions of the screen. Most, if not all, Mediaeval screens were painted, and there is every reason why modern screens should also be decorated with colour. The probability of failure is considerable, and it should not be attempted unless it can be carried out by one who possesses a keen sense of colour. Most modern attempts are such dismal failures it makes one think that the colour sense is now very rare. But there are some exceptions to the failures, and improvement is impossible unless attempts and experiments are made. In the old examples of painted screens that remain very few colours have been used. Nearly all good colourists seem inclined, from time to time, to reduce their palette.

I personally deprecate the attempt to reproduce the work of the past. An artist cannot copy other people's work, either in form or colour. His work may, no doubt, unconsciously reproduce forms and so forth, but, however strong the resemblance may be between his work and that which he most admires, it will not be a copy or reproduction, but his own expression of the beautiful. The demand for mere copying leads to the very poor, uninteresting and inartistic work which is to be seen in such large quantities all around us. The old work has been studied a great deal, no doubt, but perhaps more with a view to reproduce than to learn, to copy than to acquire experience and knowledge.

No one has ever made a closer or more careful study of old work than did William Morris, and no one ever copied less than he did. He did not confine his study to one branch of old work but to all, and he made just as careful and close a study of nature, the fountain-head of all beauty. The study of nature has been too much neglected. It seems to me absolutely essential for everyone connected with the decorative arts.

Stalls and Desks.—Mr. Micklethwaite's tract tells us that "well-furnished churches had stalls with misericordes, or turn-up seats and desks on each side of the chancel, and returned at the west end against the screen. Parish churches had only one row of stalls, but sometimes there was a bench in front of the desks for the use of song boys. Poor churches had plain settles instead of stalls."

The growth of the choir in most modern churches necessitates a considerable amount of accommodation. I must say I think many churches have too large a choir. The old arrangement can hardly be improved upon, unless it is considered better to turn the choir out of the chancel and put it into a gallery at the west end. There is, no doubt, much to be said for both plans, and where the

* A paper by Mr. C. S. Spooner, read before the Architectural Association on Friday, February 10.

chancel is small it is certainly better not to block it up with choir seats and organ.

One row of seats for men and one for boys on each side of the chancel should be enough for any parish church. I think it is better not to divide the seats with arms or elbows, as that arrangement would make the whole very long and would fill up the chancel too much. The great thing is to arrange the seats not only to leave plenty of room in the chancel, but also to give the appearance of space. I think it is a mistake to raise the choir seats above the level of the chancel, and better to stand them on the floor. If raised, too much prominence is given to the choir. No better arrangement has yet been devised than that of returning the back row of seats against the screen for the clergy. These seats might very properly be divided by elbows, when that luxury can be paid for. The advantages of this arrangement are that the clergy are brought well out into the church in the most convenient position for them to take the services. In the greater part of morning and evening prayer they act as the spokesmen for the people and should face the same way, and in the parts where they address the people they only have to turn round where they stand to do so. They are not separated from the choir and yet occupy the most important places—as they should—and there is plenty of room for all the staff connected with the parish and generally some over for any extra clergy who may be present on special occasions.

The desks should not be too near the seats, nor too high; plenty of room should be left for kneeling and the height convenient for that attitude; there should also be an extra shelf, or shelves, for books below the desks. The boys will only want a desk, which should be as small as convenience will allow. The Rev. Percy Dearmer, in his book, suggests that boys behave better without a desk and kneel upright, which is, no doubt, very desirable, and it would look better in the church, but it strikes me as being a little hard on the boys to have no place for their books.

The great lectern stood in the middle of the choir, and upon it lay the books for the choir office and the service of the altar. Now that everyone can have his own book such a lectern is unnecessary. It is, however, usual to provide one for a big Bible. The old lecterns in the form of an eagle were probably used to read the Gospel from, and stood on the north side of the sanctuary. The form is equally suitable to read the lessons from, and if artistically treated and made very unlike a real bird, may be rather nice.

Personally, I don't think the form a very good or suitable one for a desk to carry a book. The thing is, after all, a desk, and the more it looks like what it is the better. The various attempts one has seen at a figure representing an angel holding the book upon his head would, if even passably executed, be open to the same objections as apply to caryatides.

The form of a double or single desk seems to me to be much the best; it may be treated in a great many different ways, with or without candle-holders, and may be made of either wood or metal. The lectern should stand on a step or platform raised above the level of the nave, more or less according to the size of the church. The top of the desk should not be too high, or the reader's voice is checked. This is one of the few cases in which utility clashes with appearance. In the case of a single desk, it certainly looks better for it to be steep and to rise well in front, but there is no doubt as to which ought to be sacrificed.

A long lectern cloth over the desk, and hanging low down front and back, looks extremely well. It should be of rather heavy material, the exact width of the desk, and be finished with a good fringe at each end. It may be decorated with embroidery, but if so there should be a good deal of embroidery, or else none at all, and the design should, I think, be restrained and quiet, something that will give a rich general effect. Embroidery is necessarily expensive, and unless it is thoroughly good and artistically done it is rather disagreeable than otherwise. Poor churches must dispense with such an expensive luxury. A good woven material will look very much better than any but the best embroidery.

It is important, when planning a church, to provide a place for the organ. Much has been said about the best position for it, and I understand that musicians agree that a gallery at the west end, or the rood-loft, is the best place for it. There are objections to both of these places if the church is not very lofty. Unless there is a clerestory a large west window is necessary to light the church; an organ at the west end would block up this window.

Now, it is difficult to make a clerestory look well from

the outside unless a good deal of money can be spent upon the building. I have not seen a modern inexpensive church with a clerestory that seems to me successful externally. I particularly dislike a lean-to roof over the aisles. Lofty aisles with a flat roof and a parapet get over the difficulty but this is, of course, rather expensive, and may not suit the position of the church. A minimum height of 17 feet is wanted for an organ, and that will only do for a small one; 33 feet is wanted for a fair-sized organ. A clear space of even 17 feet above the rood-loft to the wall-plate means a lofty church. The organ should be divided and placed each side of the loft in any case, as the middle is required for the rood.

It is obviously objectionable to shut the organ up in a small chamber. Perhaps the best way is to divide it and provide two small shallow transepts on either side of the chancel for the swell-box and other parts, and to bracket out for the pipes. The drawback to this plan is that it adds a good bit to the cost of the organ. I shall be much interested to hear how others have got over the difficulty.

The organ case may be made a very pretty thing in a church, especially if the instrument is bracketed out from the wall. Unless the pipes are gilt, they look best in their natural colour, and if decorated at all, the patterns should be very quiet and not conspicuous, and of such a kind that the pipes always look like organ pipes and nothing else. They can be grouped to suit the position and surroundings, and can be supported by bands or rails framed into or attached to posts or uprights. The lower part must be panelled, to hide the bellows and the unsightly parts of the instrument. It is better to arrange for the organ to be blown by a small gas or oil-engine or an electric motor, a being more convenient and, I understand, cheaper in the long run than hand labour. But if the organ is to be blown by hand, then the lever should be so arranged that the blower is not shut up in a chamber where he cannot take part in the service. Late Mediæval pews still remain in some churches. Where they were provided, they were arranged with wide alleys both in nave and aisles, and were placed in a block towards the east of the church, leaving wide space at the west end. Modern churches are too much blocked with pews or chairs to look well. At St Agnes, Kennington, I noticed many of the chairs—which, by the way, are not battened together—are piled together at one side out of the way, leaving a good many in a block each side of the middle alley towards the east of the nave, quite enough for use on a week-day. This not only has a very good effect in the church, but it gathers a small congregation together. English people seem to be very shy, and they will slip into a church and take a seat in the nearest back row that is unoccupied. We have all seen a very fair congregation scattered about over a good-sized church, giving a sense that there are very few present.

Some of these Mediæval pews are very nice pieces of furniture. They may not be very comfortable, but comfort is a more or less modern invention or discovery in the North. We must remember that people in the Middle Ages went to church to take part in the service of the altar, not to sit and listen to a sermon, and these pews would not be used for sitting very much. There was a good deal of movement, and much more kneeling and standing than English people have been accustomed to of recent years, and besides this, these seats were not much more uncomfortable than the seats the people had at home. They generally have a solid end, shaped at top, sometimes into a "poppy-head," with a moulding running down the edge, and the outer face was very often carved. The seat was framed into these ends, and also a rail, often moulded and carved, to lean against. One or two rails lower than the seat strengthened the construction. The pews at the old of the two churches at Walsingham, in Norfolk (I forget whom the church is dedicated), are the best examples I know of Mediæval pews.

The church itself, too, is a very beautiful example of fourteenth-century parish church—unrestored. I think pews should be made as inconspicuous as possible in light in appearance, with either solid ends or framed ends and with low backs, to enable people to kneel comfortably and reverently. The rule of the Ecclesiastical Commissioners that seats must be 3 feet from back to back should be looked upon as the minimum—3 feet 3 inches is better. Mr. Norman Shaw has designed the best modern pews I have seen for the church he built at Bedford Park. As material, of course any wood may be used. There is one, however, which in my opinion should not be tolerated—mean varnished pitch pine. In colour and grain, I think

will most certainly disfigure any building into which it is put. Without varnish it might be just tolerable. I cannot see why cheap pews should not be painted and varnished. If the painting is well done and the varnish allowed to harden before they are used, they will last for a very long time, and, when very shabby, they can be repainted and made to look as good as new. A harmonious and quiet colour can be used, which will add much to the look of the church.

A pulpit "was ordered by the injunctions of 1547 to be provided where it did not already exist."

The pulpit may stand in almost any part of the church. The Rev. Percy Dearmer says:—"As a rule, it should not be east of the easternmost row of seats, but should project forward or two into the seats on its side." He further suggests "that the floor of the pulpit be not lower than the shoulders of the people when they are sitting down," and recommends that the position for it should be carefully fixed, until the spot in the church is found:—"(1) Where the voice rings truest and clearest with least effort. (2) Gesture becomes most easy and unrestrained. (3) The largest part of the congregation can be seen." And he adds, "It will generally be found that the same place will be best for all these purposes."

Obviously, a position in the middle of the church where the pulpit would hide the altar, or compete with it in importance is impossible.

The height of the floor will, of course, vary with the size of the church, but it should never be very high. That elevation which gives the preacher command of the whole congregation is sufficient, and no more should be given. The sides of the pulpit should be 3 feet 3 inches above the floor of it, and the top should be broad enough to hold books. A small removable desk is necessary for those who use manuscript or notes. It should be so contrived as to be easily raised and lowered and easily and rigidly fixed. I think, on the whole, this is best made of metal, with a rather desk tightly strained, and I think that horrid little cloth called by the shops "antependium" should be eliminated. The diameter of the pulpit should be ample; never less than 3 feet. A seat is unnecessary. A lower shelf beside is useful for books, and a secure corner for a glass of water where it cannot be upset is convenient. A standing-board over the pulpit is generally advantageous to both preacher and congregation, and may be made to look very well in the church. A background of wood is often helpful to a weak voice. I think wood is very much the best material for a pulpit; it looks well painted and adds colour to the church. Stone and marble are comparatively cold in this climate, and so is metal.

After the altar the font is the most important thing in the church. The best place for it is at the west end in the middle. If there is room, let it stand on a raised platform, as at All Hallows Church, Southwark, for instance. It should be large and of handsome material, and a cover is essential, which may be made of wood or metal. Stone or marble are perhaps the best materials for the font, although metal may be used. There are several Mediæval fonts of cast lead still existing. It is customary to line fonts with lead, but now that the water is blessed at every baptism and discharged into the earth when the service is over, it seems to me unnecessary, unless a porous stone is used. Most of the bishops, however, I believe, still require it to be done. A waste pipe is necessary, with a plug. This pipe must discharge into a dry well in the ground. A desk to hold the priest's book is a great convenience. It is seldom provided, but it seems almost necessary. The priest can hardly hold the child and the book while he is administering the Sacrament of Baptism. He lays it on the edge of the font usually, but, besides the risk of its being tipped into the font, there is risk of damage by splashes of water. Each desk should be of metal, with perhaps tightly-laced leather to carry the book. It might be removable, fitting into sockets in the font, and should be easily adjustable to any angle or position.

The Litany Desk.—"This has been so often included," says Mr. Micklethwaite, "in lists purporting to be of the elements of the second year of Edward VI., that it is mentioned here, lest it should be thought that it has been inadvertently omitted. But I cannot find any evidence of its use so early. The injunctions of 1547 ordered that immediately before High Mass the priest and others of the choir, not the priest alone, as is now the custom, should kneel in the midst of the church and there sing or say, clearly and distinctly, the Litany. This was a modification of the old procession, and the Litany itself was often

called the Procession. Some such convenience as the desk very likely soon came into use, but the only mention of anything of the kind for many years that I know of is one entry in some churchwardens' accounts of the time of Mary belonging to the parish of Cheswardine, Salop. It runs 'for a forme to serve in procession tyme.' This 'forme,' I have no doubt, was a thing for the priest and others to kneel at when singing the 'procession' or Litany."

"Cousin, in 1627, as Archdeacon of the East Riding, inquires, 'Have you a little faldstool or desk with some decent carpet over it in the middle alley of your church, whereat the Litany may be said?'"

The Litany desk has good authority and has become very usual. It should be large enough for two, or in large churches three, to kneel side by side, and may be covered by a cloth in the way I have suggested for the lectern.

Bells.—A parish church was provided with bells, and even the smallest had two. It would be well if this practice could be revived; a single bell has a depressing effect.

The notice-boards on the door or in the porch are usually unsightly things. I should like to see well-designed notice-boards provided with the permanent notices, or one painted with good lettering and the other provided with a glazed door, and the notices within written by someone who has learnt to write, so that they may be legible and not disagreeable to look at.

That is all that I have to say this evening about church fittings.

There are several things I have not touched upon, not that they are unimportant, but because I feared to occupy too much of your time, and I am afraid that I have not been able to add anything to that which had already been said and written on this subject. My only excuse is that, in recapitulating what others have said and written very much better than I can ever hope to, I may have brought together certain considerations that ought to guide us in designing these things, and which may perhaps be useful to the younger members of the Architectural Association, whose attention so far has not been turned in this direction.

I cannot, of course, suggest how these things may be made beautiful, but unless they are beautiful, not only in design, but in execution, they will be failures.

Some one has well said, "Everything that nature makes is beautiful, everything that man makes should be—it is wrong if it is not."

Mr. H. SIRR, who proposed a vote of thanks to the author of the paper, said Mr. Spooner had not only given them the benefit of his experience and opinion, but he had gathered together a vast amount of information, and brought to their notice the various rules and other considerations which should be present when architects were engaged upon the design of churches. If character and harmony were to be present in their churches, there were at least three considerations not to be lost sight of. First of all, there must be a trained mind and eye to control and direct the introduction of fittings and decorations. Secondly, good artists and craftsmen must be employed, with whom there must be direct intercourse. Thirdly, the best materials must be used. A great deal could be said under each of these headings, but the speaker thought all such considerations had been well acknowledged by the author of the paper. Mr. Spooner had said so much that really very little could be added to the remarks. All the rules touched upon were the result of the experience of those who were best able to speak upon the subject, and they admitted of no discussion at all. He was glad to hear Mr. Spooner say that it was unnecessary that the frontlet should be mounted upon a screen, and if it was properly lined there was no reason why it should not look well. Then, again, with regard to the altar, of course everyone agreed that it should be of the best material, but if they could not have much ornamentation upon it, at times inlay might be used although it would be seldom seen. The paper also mentioned the old world pew, and some seats in Norfolk churches were described. Suffolk also possessed some fine examples. There was no county where so many were preserved. Those in the eastern counties were decorated in a way that suggested there was at one time quite a school of artists in this work, though in the present day they seemed to have little knowledge of the methods employed. It was absolutely necessary to have samples of hangings sent down to churches before making a choice, as it was impossible to judge of the effect of such decoration without seeing it in position.

Mr. F. C. EDEN seconded the vote of thanks and alluded to the great difficulty experienced by architects in controlling the choice of gifts to churches by parishioners. Referring to simple churches he instanced the furnishing of one with a bare brick interior. It seemed to defy the utmost skill because the colour of the brick practically killed any treatment. Whitewash was the only remedy, and nothing made a more sympathetic background for pictures and carving.

Mr. G. H. FELLOWES PRYNNE congratulated the author of the paper on the straightforward way in which he had dealt with his subject, because it was a difficult one to deal with before an audience that must be mixed. Mr. Spooner had taken a broad view and had shown that their art embraced all that was artistic, and the whole subject could be looked at in a broad sense. However interesting the points of the paper were to some, it was not equally interesting to others, because there must be many present who would not have so much chance as others of doing church work. They must all remember, however, that there was a great demand for churches, and it was, therefore, well to be acquainted with some of the details of that part of their work. Speaking as one who had acted as assessor of church designs, the speaker said the deplorable things that were done in church work made him feel that there was very little thought given to anything outside Domestic architecture. It would astound some people to know the ignorance that was displayed in such competitions. Competitors very often did not possess the A B C of church architecture. In conclusion he said any artist should be glad to design the fittings and furniture for churches. The work embodied the highest ideal, and in that spirit alone he was sure would be found the germ that made successful any of the church work of the present day.

Messrs. C. J. TAIT and G. LUCAS also joined in the discussion.

Mr. SPOONER observed that the altar, even where of reasonable dimensions, lacked in appearance the importance that it deserved. Its importance is in a great measure said to be proportional to the number of steps upon which it is placed. His own observation, however, led to a contrary conclusion. The more that it is isolated, and the more its pyramidal approach is accentuated, the more its scale is reduced. Not only does it gain in dignity by standing upon a broad platform, but if the top is below the level of the eye, as viewed from the nave, another dimension is added. The rival claims for the position of the organ do not come into everyday practice. A surpliced choir in the chancel is generally demanded when any additions to the accommodation of a church are undertaken, and where the choir is the organ must be. Therefore a chamber immediately behind the choir is rendered necessary. Nor is the sheltering of tone provided by a chamber an undesirable quality in the case of the average parish organ. One advantage to be gained by placing the choir in a west gallery would be the space thus gained in the chancel. Space is a necessary accessory to dignity of ceremonial, and the chancel under such circumstances might also well be shortened, thus bringing the altar within nearer view. Its present position, pushed closely against the east wall, compares ill with its older position upon the chord of the apse. Space behind the altar is eminently desirable for effect, but probably no adequate effect is to be obtained in the presence of a window situate, as custom dictates, immediately over the altar, the result being that nothing beneath it is seen with distinctness. It would seem neither a serious innovation nor an impracticable one were the morning chapel to be placed eastwards of the chancel, where we are accustomed to see a lady chapel. The eastern wall of the chancel could then be treated as an arcade, and is often done in the latter case, and the limitations imposed by the dead wall thereby obviated.

The Ayr Town Council have had under consideration the steps to be taken for the preservation of the Old Bridge, and consulted Mr. John Young, burgh surveyor; Mr. John Eaglesham, C.E., Ayr, a former surveyor of the burgh; and Mr. James A. Morris, F.R.I.B.A., Ayr. At the last meeting these experts were requested to submit to the committee a scheme for the substantial rebuilding of the bridge, saving as far as possible its present form and structure. The meeting empowered the engineers and architects to make what openings in the bridge they might find necessary for the framing of the required scheme.

LIGHTING OF BUILDINGS, ETC., BY ELECTRICITY AND INCANDESCENT GAS.

I.—INTRODUCTION.

THIS subject is of the utmost importance to architects and others engaged in the erection of buildings. The object of the paper is to help to create an increased interest in this most important part of an architect's duty. Light is essential to health, as it affects the growth, development and maintenance of every living thing, whether of the animal or vegetable world; its influence is much greater than we usually admit, and it applies not only to natural or sun light, but also to every description of artificial light. Allow me to remind you that both kinds of light are very intimately connected, for every kind of artificial light in general use is directly or indirectly produced from the products of the pent-up rays of the sun in past ages. In employing artificial light it is essential in the first instance to determine the amount that may be required, the mode by which it is measured, and the laws that govern its intensity.

Amount of Artificial Light Required.

1. Taking a general average, the amount of light required for reading and writing may be taken at one candle foot, this, however, depends on the nature and extent of the reflecting surfaces influencing the light. For work requiring much detail or on coloured materials not less than five candle feet should be provided; even this may be doubled for the finest mechanical work, such as engraving and similar operations.

Mode by which Light is Measured.

2. To start with, we must have a definite standard light for comparison (which it is said at present we do not possess). The general legal standard is the standard candle, a spermaceti candle of certain dimensions, weighing one sixth of a pound avoirdupois, and burning 120 grains per hour. From this a standard of light is obtained, which at a distance of 1 foot from the object illuminated produces illumination equal to one candle foot, or as generally expressed, "one candle-power." At other distances the illuminating power is determined by the "law of inverse squares," which states that the intensity of light varies inversely as the square of the distance. As, for instance, at the distance of 2 feet the intensity is reduced to one fourth of that at the distance of 1 foot, the same rays of light having to cover four times the area. It is important to bear in mind that this law only holds good when there is no refraction or reflection.

Photometer.

3. Light is measured by an instrument called a photometer, the principles of which depend upon the well-known law of inverse squares. The usual form of photometer is that of a straight graduated bar, having a standard light at one end and the light to be tested at the other. A movable screen is placed on the bar between the lights; the screen has an opaque disc in the centre enclosed by a transparent ring outside the disc; the screen is adjusted on the bar that the shadows on the opaque transparent portions are equal or of the same intensity. The square of the distances at which the lights are from the screen will express the relative intensity of each light.

An improved photometer for testing high-power burners has been invented by Mr. Charles Carpenter and Mr. James W. Helps, and has been in use for some time at the South Metropolitan Gas Company. The standard Carcel or Pen lamp, which is equal to ten standard candles, is not compared directly with the light to be tested, but serves to fix a determined value to a secondary standard of the same quality and colour as the light to be tested; by this method the colour difficulty is overcome. The light of the secondary standard is adjusted by a sliding shutter worked by a screw so as to produce the same amount of light as the standard lamp. Two divided scale bars are used, having a terminal common to both at the secondary standard.

The primary scale is provided with a movable screen box containing a reversible Leeson star disc, the scale bar being divided equally from the centre towards the primary and secondary standards. The secondary standard rotates that it may occupy the same relative position as the primary.

* A paper by Mr. B. R. Tucker, member of the Council of the Society of Architects, Member of the Royal Sanitary Institute, Chief Surveyor, War Office, read before the Society of Architects on Thursday, February 16.

On the secondary bar is mounted a reversible Bunsen disc-box, and at the other terminal the light to be tested. The disc-box having been adjusted, the intensity of the light being tested may be decided by the square of the difference in the distance between the secondary standard and the disc-box.

Light should be Distributed.

4. The law of inverse squares proves that in order to obtain the best result with economy in lighting, it is necessary, in the case of a large room, or building, or church, that it should be lighted by means of a reasonable number of separate lights, judiciously distributed, instead of by a large single light or lights placed centrally in the room or building. It is somewhat difficult to lay down any definite rule for the placing of the lights for lighting large rooms or buildings, as circumstances, &c., so greatly differ; also the quantity of light required is subject to considerable variation, according to the nature of the building and the purpose to which it is to be devoted. However, as the purpose of lighting is generally to produce a certain intensity of light at the plane of illumination, which is usually assumed to be from 3 feet or 4 feet above the floor, the lights should be so placed and of such a nature as to produce a minimum illumination of (say) about one candle foot at the parts furthest from the light.

Light should be Diffused.

5. The best light is a soft well-diffused light, which is usually obtained by employing ground glass globes, &c., of different forms and patterns. Flickering lights or unshaded lights within the field of vision, also a very bright or intense light, or a sudden variation in the intensity of the light, or violent contrasts of brilliant illumination and deep shadows, are all highly objectionable, being harmful to the eyes.

Colour of the Light.

6. Best artificial light is that which most nearly approaches in colour to natural light. Natural light is not perfectly white, but it is of a yellowish-white, which tempers the rays of light; this is especially the case in the morning and evening time, when the light is softer than in the middle of the day.

II.—ELECTRICITY.

Electric lamps are of three kinds—arc lamps, Nernst lamps and incandescent lamps.

Arc Lamps.

These are of two kinds—open and enclosed.

Open Arc Lamps.

7. This lamp is the most intense artificial illuminant. Its light is produced by sending a continuous or alternating current of sufficient potential difference between two slightly separated carbon rods, producing a most brilliant light. In an ordinary arc lamp the upper carbon is the positive. This is slowly fed downwards by means of a plenumoid mechanism as fast as it is consumed. The chief consumption of energy is at the lower end of this carbon, being the most brilliant part of the arc, where the carbon fairly boils away into vapour, producing a slight hollow in the centre of the end known as the "crater." The lower carbon, or negative, is evenly and somewhat sharply pointed. If the arc is short, particles of carbon are torn off from the surface of the crater of the upper carbon, and many of them are deposited on the lower carbon. With a direct current the upper carbon will burn away twice as fast as the lower (if of the same diameter), generally at the rate of about 2 inches per hour, depending on the hardness and diameter of the carbon.

The carbons are generally half an inch in diameter, and the upper, and sometimes the lower also, have a soft core of carbon in the centre, about 1-16 inch diameter; this portion more easily fuses and produces a greater mass of carbon vapour, which tends to hold the arc centrally between the carbons. The rays of light from this lamp come chiefly from the "crater," and fall at an angle of 40 degrees below the horizontal.

Arc lamps of large candle-power, usually called "projectors" (used as search lights), consume from 60 to 150 amperes, and produce a light of many thousand candle-power. These are mostly continuous circuit.

Enclosed Arc Lamp.

The arc of this lamp is enclosed within an inner globe, which excludes practically an access of fresh air. The ends of the carbons keep fairly flat, the arc only fills a portion of the space between the carbons and it travels about slowly

from one part to the other. The carbons in this lamp are consumed only at the rate of one-eighth of an inch per hour, so that they will burn from 80 to 120 hours or more without retrimming. In these lamps the arc is much longer, and the downward obstruction of the light by the lower carbon is much reduced. The double globe in these lamps makes them safer. The advantages of this lamp consist in the saving in the cost of carbons, the saving of labour in retrimming, and the inner globe—being often of opal glass—insures a better diffusion of light.

This lamp also gives a much rounder and fuller distribution of light; although, with the same energy, the minimum light is little more than half that of the open arc, yet the better distribution of light fully compensates for the difference.

For interior lighting the outer globes are sometimes of opal or ground glass, so that the bluish tinge which is produced by the long arc is partially eliminated. Several enclosed arc lamps are now in use fitted with one globe only, and are giving greater satisfaction than those fitted with two globes, as they afford a greater and better diffusion of light.

It should be stated that opal globes absorb from 50 to 60 per cent. of the light. Ground glass, according to its density, absorbs from 30 to 50 per cent., and clear glass about 10 per cent. From this it will be seen how wasteful is the usual method of diffusing the light by opal and ground globes. It is only necessary to disperse the downward rays by such globes, the upward rays should be unobstructed and, for interior lighting, reflected downwards by means of an umbrella-like shade.

Arc lamps are also used in studios, factories, &c., of the inverted type, the rays of which are thrown on a white ceiling, when they reflect and produce a most pleasing effect.

Nernst Lamp.

8. This lamp comes between the arc lamp and the incandescent lamp. The light is obtained by making incandescent a filament of mixed oxides, generally from 1 inch to 1½ inch in length and placed either horizontally or vertically. The filament when cold is a low conductor, but when heated by a coil having a current passed through it, it becomes a conductor and then goes to a vivid incandescence. This filament cannot be run by itself without a resistance, which is necessary to prevent the light becoming unstable. The filament being incombustible, it is not necessary to place it in vacuum, as in the case of the incandescent lamp.

It takes a short time to light the lamp, and no doubt this is one of its drawbacks, together with the frequent breakdown of the filament and heating coil, owing to vibration. The average life of the burner is from 300 to 400 hours. The efficiency of this lamp is extremely high, being .95 watts per candle-power on 100 volts circuit and .88 watts per candle-power on high-voltage circuits. A one-ampere lamp will give 105 candle-power on a 100-volt circuit, and 250 candle-power on a 220-volt circuit. This is practically three times the amount of light given by the ordinary incandescent lamp consuming the same amount of current.

Incandescent Lamp.

9. The incandescent lamp in general use consists of a carbon filament possessing a high resistance to the electrical current and of sufficient strength to insure a fair durability or life to the lamp. For a time it was difficult to obtain such a filament, but by the persistent efforts of Edison, Swan and others, about twenty years ago such a filament was obtained. The filaments, except those for special lamps of large candle-power, are made of soluble cellulose threads, hardened, carbonised and "treated."

The typical lamp consists of four parts—the base to carry the lamp in its socket, the glass bulb, the filament and the filament mounting, which includes the connecting wires. The air is exhausted from the bulb to prevent the filament being consumed when made incandescent. The length, shape and diameter of the filament varies according to the make of lamp. Generally they have one or two convolutions so as to admit of sufficient length to insure the necessary resistance and to obtain the required candle-power, which depends on the superficial area of the filament.

Lamps are made of the following candle-power—2½, 5, 8, 16, 25, 32, 50 and upwards to 600 candles. Those of 16 candle-power are mostly used and the voltage is from 100 to 230. The life of an incandescent lamp practically depends on the temperature employed, other things being equal.

There is a steady disintegration and vaporisation of the filament during incandescence, which produces a material increase in the resistance, and a consequent decrease of current, temperature and light. An ordinary low efficiency 100-volt 16 candle-power lamp takes about .6 amperes. At 200 volts a 16 candle-power lamp takes about .3 amperes, and a 250-volt 16 candle-power lamp about .24 amperes.

Lamps can be obtained of three classes—low, medium and high efficiency, absorbing respectively from $2\frac{1}{2}$ to 4 watts per candle-power. On the whole the best result is obtained by using lamps 3 to 3.5 watts per candle-power.

Practically, the B.T.U. is equal to the current required for No. 16—16 candle lamps per hour. The rate per unit for electrical current in the City of London supply varies from $2\frac{1}{2}d.$ to $5d.$ In one business house $2\frac{1}{2}d.$ is charged per unit for current used in the daytime in the basement, $3\frac{1}{2}d.$ for that used on the ground floor and $4\frac{1}{2}d.$ for the floors above.

III.—INCANDESCENT GAS-LIGHT.

10. Incandescent gas-light is the result of two important discoveries, viz. :—(a) The Bunsen burner and (b) the incandescent mantle.

(a) About fifty years ago Bunsen invented the atmospheric burner (which bears his name), by which a non-luminous gas flame is produced by mixing coal gas with a certain proportion of the air needed for its combustion. The proportion varies, but is generally about one to five or six. The discovery of this burner has been of immense importance, enabling gas to be used for heating purposes as well as for incandescent lighting.

(b) The discovery of Baron Von Welsbach, in 1886, led to the production of a mantle of refractory oxides, having as a base that wonderful and rare earth or oxide of the metal thorium known as thoria, and culminating in 1891-2 in the further and more wonderful discovery of the power exerted upon the thoria by having a trace of ceria mixed with it, led to the production of the marvellous intensity of light which these mantles produce. The exact proportion of these rare earths was found after many careful experiments to be 99 per cent. of thorium and 1 per cent. of cerium. It is remarkable that the slightest deviation from these proportions, one way or the other, causes a diminution of light. It is still necessary to resort to further research before we can fully understand how it is that the incandescent mantle can produce light equal to eighteen candles per cubic foot gas consumed; whereas, when we use the gas in the ordinary way, in producing a flat or other flame we obtain only about three candles per cubic foot of gas consumed, one-sixth that of the incandescent mantles. To produce a good mantle the rare earth must have qualities difficult to find; it must be free from atmospheric influences, must be sufficiently refractory not to seriously soften at the temperature of the flame and non-volatile. So far, it is found that thoria occupies a position by itself as the ideal basis for the mantle.

The efficiency of the mantle at the first start with the "C" burner is equal to fifteen candles per cubic foot of gas consumed; it diminishes with the age of the mantle.

The incandescent "C" burner is—

Five times as efficient as an Argand gas-burner.

Six " " " Ordinary do.

Three " " " a Regenerative do.

Notwithstanding the considerable improvement made in the mantles of late years, it is stated that to see incandescent gas-lighting to perfection it is necessary to go to Berlin. In Berlin the mantles are used without any coating to protect them in transit, the burning off of which when first lighted causes a certain amount of deterioration and loss of incandescence. Mantles should not be kept in stock for any length of time, as they deteriorate by the action of the oxygen of the atmosphere.

By-pass burners should be used; they only consume through the by-pass 1 foot per twenty-four hours. Should it produce an unpleasant smell, it can be prevented by reducing the flame to a small blue light only. Very much depends on the description of shade used with mantle burners; the object should be to soften the light and approximate it in colour to that of natural light.

Take care that the mantles are perfect; sometimes the slightly defective mantles known as "seconds" are sold as perfect mantles. Seconds are the result of the sorting out, and consist of those short in length, stitches dropped in the knitting, or other deformation or damage; these are often palmed off for the perfect article.

The convenience of being able to light and extinguish gas-burners at any one point at a distance away, as in the

case of the electric light, is well recognised. The Pneumatic Gas-Lighting Company and others have invented apparatus for this purpose. It consists merely of a ligular valvular device at the base of the burner to which attached fine flexible tubing to conduct the air-pressure, the other end of which is the pneumatic push or switch, which the valve is worked. The use of this invention insures convenience and economy in cases where gas-lighting is required only at intervals.

Natural ventilation is very much improved by the use of incandescent gas-lighting. The heat of the burners not only causes a healthful circulation of the air within the room or building, but it materially assists in the removal of the vitiated air in all cases where a proper provision has been made for the escape of the same, and it undoubtedly assists in the prevention of down-draught in certain cases in churches, halls, large rooms, &c.

Some experiments were carried out in the Museum of Art Gallery at Birmingham in 1902, and reported by Professor Percy F. Frankland (Birmingham University). The results of which are most interesting and instructive. It is stated that the experiments clearly showed the following results under the condition of the efficient ventilation which prevailed at the time :—

(a) In the absence of any artificial illumination there was a slight increase in the percentage of carbonic acid in the air during the course of the day;

(b) With the electric arc lamp illumination, the increase in the percentage of carbonic acid was distinctly more marked;

(c) With the incandescent gas illumination, on the other hand, there was a distinct diminution in the percentage of carbonic acid in the air.

It is stated that the explanation of this diminution is not far to seek, it being obviously due to the more efficient ventilation of the gallery, caused by the greater draught of heated air through the ventilating shafts placed above the incandescent gas-burners. The circumstance that the percentage of carbonic acid actually diminishes during the use of the incandescent gas-burners proves that the products of combustion, from which damage to the pictures might be apprehended, are completely carried off by the ventilation, which is so much promoted by the gas-burners.

In the opinion of Professor Frankland the incandescent gas installation in the Art Gallery is to be preferred to electric arc lamps; and although these lamps do not give rise to sulphur compounds, they do generate ozone and oxides of nitrogen, which are calculated to act prejudicially on pictures. In order that this advantage may accrue from the use of the incandescent gas illumination, it is, of course, necessary that proper ventilation should be provided over the gas-burners to prevent the circulation of the products of combustion. The following are some of the high-power lamps at present in use :—

The Lucas lamp is a very good description of the latest type of incandescent gas lamp that is now coming very much into use. The special advantage of this lamp is that it does not require any compressing plant or machinery to raise the pressure of the gas as is required by the usual type of high-pressure burner; each lamp is self-contained and is constructed to work with the ordinary pressure of the gas. The lamp is of simple construction, with no working parts to get out of order, and contains a Bunsen burner of large diameter fitted with a special description of regulating nipple for adjusting the supply of gas, a short glass chimney or globe, and an elongated metal cylinder or chimney. The joint between the burner gallery and glass chimney, and that between the glass chimney and the metal cylinder, are substantially closed so as to exclude the external air, thereby causing a powerful suction to be produced on the burner when the lamp is alight. The proportion of gas and air burnt is about $5\frac{1}{2}$ volumes of air to one of gas, which is the most powerful explosive mixture obtainable with coal gas, and produces the highest possible flame temperature. Thirty-nine cubic feet of this mixture consumed by the Lucas lamp per hour will produce an intensity of light equal to 200 standard candles. The lamps are made in four sizes, with consumptions of gas as follows :—

200 candle-power	6 cubic feet of gas per hour.
400 "	10 "
700 "	$17\frac{1}{2}$ "
1,000 "	24 "

The lamps can also be grouped in clusters of two or three lights with either size of burner. The essential principle of this description of lamp is the proportions and the combination of the glass and metal cylinder above

the mantle, and the enlarged Bunsen tube, the object of which is to create a sufficient draught to draw the whole of the air necessary to produce the proper and most perfect combustion of the gas within the mantle through the burner tube, external air being required or used at the point of ignition, and also to admit of a larger mantle being used, by means of which a greater area of incandescence is obtained, producing at the same time the greatest intensity of light, because the flame temperature is the highest obtainable. A special feature worthy of note has recently been introduced which enables the lamps to be lighted by a special by-pass arrangement (previously explained), by means of which a series of lamps can be operated from a distance, and switched on and off as rapidly and as easily as is done in the case of the electric light.

The Khoma lamp is an incandescent arc lamp on the regenerative principle, by which the gas is superheated in a chamber before it passes to the burner. The chamber for heating the gas is placed directly above the mantle, well within the heating zone. This insures the thorough superheating of the gas, in which state it better mixes with the air in the Bunsen burner than if in a cold heavy condition. By the heating of the gas the lamp develops from 20 to 25 per cent. more light from the same amount of gas, as complete combustion is more nearly obtained. No chimneys are used in this lamp; the advantage is, there is no obstruction of light and no breakages. The lamp for outside use has a windproof shield in the form of a copper cylinder for protecting the mantles during their renewal or while the lamp is being cleaned. The consumption of gas is about 4 cubic feet of gas per hour per burner, producing 150 candle-power per burner. A lamp may be fitted with a cluster of burners, but four burners are equal to 600 candle-power.

THE ART OF TO-DAY.

AN address was delivered by Mr. Edward S. Prior, architect, on the 15th inst., at the distribution of prizes to the students at the Municipal School of Art, Birmingham. The Lord Mayor presided.

Mr. Prior, according to the *Birmingham Post*, said that the economy of civilisation must find for artists a place in the theories of its welfare. That it had found them that place up till now was a matter of history, and that it was not giving up the intention was clear from the position which was now given to art in education. The number of art, craft and technical schools grew every day, and they absorbed a large amount of public money. There was, therefore, in the public mind a definite surrender of present economy for the sake of those complex ideas which were conveniently catalogued as art. Professor Lethaby, in his lately published and most suggestive account of "Mediæval Art" had told them that "every school of art is the product of antecedent arts, plus the national equation of the moment." It was clear to him (the speaker) that they had of necessity now to make the extra growth out of the being of their time, so as to qualify their art and separate it from that of former times. The apprehension of this should be the moving force in their training, for it gave them a place in the social life of their country. They were citizens of no mean city, for as artists they were citizens of humanity. The national equation of the moment was clearly set before them in the development of social life, in the conquest of man by himself so that the race might grow to a wider development. It had, therefore, become foolishness for the artist of to-day simply to follow the traditions of ancient artists. To grow to manhood he must move in the spirit of this time, in the advance to a freer and more perfect social life, otherwise he could not retain the allowance to survive. This was a far-reaching condition. It forbade them to walk in the footsteps of the past. It forbade them to paint sacred pictures as did the artists of religion, like Giotto; to exhibit moral allegories, as did Dürer; to build great churches in the fashion of Chartres or Westminster Abbey. For though they were able to do these things, yet these were not the subject matters of their art. To paint with the colouring of Titian, to draw with the draughtsmanship of Michel Angelo, to mould bronze like Cellini or etch copper like Rembrandt, to raise Portland stone like Sir Christopher Wren—all the skill for this, if they had it, yet would not be art for them. When those great men lived their capacity to do their great works was the national equation of the moment. But in these days they had neither the Mediæval atmosphere of religious faith to give their art this ancient

manner; they had no Renaissance of learning to give their art that ancient manner of scholarship. To represent that such was to be the spirit of their art was an hypocrisy. Moreover, it was turning back from the possibilities of their own art—a cowardly surrender in the face of the enemy. If they could not recover courage to make an art of their own, they as artists must break up and disappear.

Their schools in Birmingham had no intention of turning cowards and deserting the Commonwealth. They had been established and developed in view of the wide destiny of citizen art. They studied the manners of ancient artists not by appropriating their style, their treatment and their technique—which in each case was part of their evolution of art. But seeing what those artists did, they, too, trained hand and eye and feeling upon the qualities and expression of the materials themselves. Just as the old artists learnt to express themselves without bungling or uncertainty, so they learned. So they possessed the matter of art, which was its beginning—the good made beautiful—and the manner of art—the skill that grew from the seeing eye and the sensitive hand—and then, by growth away and beyond this, they grew to be artists by bringing their art into the life of to-day. There was only too much, it seemed to him, that the craft and skill of artists ought to be speaking now. They were passing on by social change to a state of humanity that was quite without precedent. In the intellectual and moral manners of mankind they could point to distinct progress towards the qualities which lead to social survival. While intellectually they had learnt to love their neighbours as themselves, in the sphere of arts had they any squeamishness, or reticence, or charity? Very little he feared. The public morals of art had been corrupted by culture. The connoisseur collected pictures, nay built a public gallery, and counted that his duty to his neighbour was done—and he would let his land be developed in a way that of necessity meant a waste of ugliness. When those who were taken as exemplars of art showed this indifference, it was little wonder that the beauty of our cities was sacrificed for the merest bagatelle of material advantage. The public-house was the practical determiner of where streets should run, not the shapeliness and usefulness of the street. The civic community, under the guise of by-laws, denied architecture the right of building for the purpose of seemly presentation. And what the community did and thought no shame for, though it spoiled the beauty of a whole country side, every individual took as the ordinary manner of life. What advertiser cared how shocking to every sense his advertisement might be? What private builder minded ruining a whole street or a whole village by a pretentious erection of glaring ugliness? Did any man think that in these things he should regard his neighbour? What parson was found refusing the most patent insincerity of degraded art, though it drove every artist from his church? The manners of art were in a very elementary state when to be shocking was thought no crime, when picture galleries multiplied, but every year city and town and country side, ever more and more, thought no shame to be offensive. Now a school of artists turning out trained workers such as they were in Birmingham must in this matter see their duty. They must be a force to check the want of manners in art.

The community which gave them that education, and so promised them the right to live as artists, could not but be influenced by them. Their attitude should be militant, as of an army trained for a campaign. The destinies of the coming art were in their hands. Here in Birmingham at some time in the near future might be a preliminary skirmish the issue of which might determine the future campaign. The Bishopric of Birmingham implied a cathedral that would be built in due course, a great church by its function, a public building for the people of Birmingham to call theirs, for them to look at, for them to enter. Why should it not be for them to create, to build it, decorate it, and fit it as a church of this century? It seemed to him that art education was a mere pretence for a city like Birmingham to provide if it denied them the means of using that education for its benefit. If built by them as architect-masons, and architect-carpenters, if sculptured by them as craft sculptors, if decorated by them as craft painters, smiths, glaziers and tilemakers, the cathedral would be, as were the ancient cathedrals, a growth from the art life of to-day which the city of Birmingham was so strenuous in maintaining. What mimicking copy could be half as fine a thing as that? If they as artists in building were to come forward for the building of this

cathedral they must develop a school of building and decoration, one that could take the position they claimed and worthily administer the charge. He knew that as part of their Municipal School of Art they had a flourishing and efficient school of architecture and building construction—a school for the planning of all kinds of building and for the drawing of all kinds of its construction, for the specifications and business of an architect's profession, for the history and style teaching out of which came the designing of the architect. But he was speaking of a school of building and decorative treatment which might be something much more. He meant a workshop of architecture ready to build and decorate. He spoke to them thus because outside of them, and an advance such as a school of art like theirs could make, a practical school of building seemed little likely. He believed that their school of art would not be long before it made a move in the direction of a practical working school of architecture. In conclusion, the speaker remarked that the success of the school had been undoubted; it had made the city a producer of art objects held in esteem in three continents. "Brummagem," which forty years ago had an equivocal sense, now spelt good workmanship and a genuine expression of art. The fruits of their enterprise in having so laid an art foundation to the commerce of their city would prove constant and abundant. But the art of a city did not lie in the distribution, however wide, of artistic products. It lay in the city itself, in its manners of life, in the sanity of its taste, in its citizenship of humanity which believed the beautiful to be good. So should their streets, their houses, their highways and byways, their rooms and courts, their temples and their factories proclaim its belief.

GENERAL.

Mr. H. H. Richardson, solicitor, an Hon. Member of the Society of Architects, of 2 Broad Street Buildings, London, E.C., has been appointed solicitor to the Society.

The Artists of Aberdeen, at a meeting recently held to consider the subject of a memorial to Mr. Robert Brough, A.R.S.A., resolved to co-operate with the London committee in raising subscriptions for the purpose of securing a cast in bronze of Mr. Derwent Wood's bust of the late artist for the Aberdeen Art Gallery, and to found an art scholarship in Aberdeen to be called the "Brough Scholarship."

Mr. George Wilson, D.Sc., A.M.I.C.E., died last week in his thirty-third year. He was lecturer in civil engineering at Leeds University, and was formerly demonstrator in engineering at Owens College.

The Committee for the preservation of the Avon banks have presented to the Home Secretary a petition praying that an inquiry be held to determine whether, having regard to the safety of the public, the detrimental effect on the traffic on the river and the adjoining roads and railways, and the special annoyance and danger caused to the inhabitants of the neighbourhood, the quarrying in the Avon Gorge should not be stopped, or, if not wholly stopped, be removed further away to a safe distance from the river banks.

The Finance Committee of Aberdeen Town Council recommend that the foreign visitors who are to be present at the opening of the extension of the Art Gallery in April should be officially entertained. The visitors are expected to come from all parts of the world, and the invitations are to be issued through the Foreign Office. The addition to the Gallery consists of a sculpture gallery, which has cost 7,000*l.*

The Carnegie Dunfermline Trust have accepted the plans of Mr. Peter L. Henderson, Edinburgh, for a library and reading-room at Townhill. In accordance with the conditions of the competition, premiums of 25*l.*, 15*l.* and 10*l.* have been awarded for the three designs considered next in order of merit, namely, those of Messrs. James T. Scobie, Dunfermline; Henry F. Kerr, Edinburgh; and Kerr & McCulloch, Alloa. The building, which will cost 3,500*l.*, will make provision for a library of 4,500 volumes, reading, recreation, billiard and smoking-rooms.

The Council of University College, London, have adopted the following resolution:—"That the Council, in accepting with much regret the resignation of Professor L. F. Vernon-Harcourt of the Chair of Civil Engineering and Surveying of the hospital, desires to place on record its high appreciation of the services he has rendered to the college and hospital during his long connection with them, and of the distinction he has conferred on the chair he has held."

The Candidates for the headmastership of Sheffield Municipal Technical School of Art have been reduced to the following four:—R. E. Bush, Headmaster of Bris Municipal School of Art; A. C. Jahn, Headmaster of Wolverhampton School of Art; G. Marples, Headmaster of School of Art and Technical College, Huddersfield; and F. Shelley, Headmaster of Plymouth School of Art. The deputation representing the committee will visit the respective towns in which the four selected candidates are located.

Sir W. B. Richmond, R.A., has given notice that he propose at a forthcoming meeting of the London County Council the appointment of a special committee, to designate the "Improvements Reference Committee" whose duty it shall be to advise the Council upon proposals involving permanent or constructive work, designs in the selection of which artistic knowledge and taste are requisite. He will further propose that the following should form the committee:—The President of the Royal Academy, the President of the Royal Institute of British Architects, the President of the Society of Antiquaries, the President of the Royal Institute of Civil Engineers; Mr. Brock, R.A., sculptor; Mr. Frampton, R.A., sculptor; Mr. Jackson, R.A., architect; Mr. R. Blomfield, A.R.A., architect; Sir Laurence Alma-Tadema, R.A., painter; the Earl of Carlisle, Lord Windsor and Lord Balcarras; and that the general purposes committee should submit to the Council for approval an order of reference to that committee.

In the Notice of the death of Mr. James Thomson, Glasgow, which appeared last week, the Clydesdale Bank Scotland and the British Linen Company's Bank were erroneously included among his works. The business will continue to be conducted by Mr. Thomson's two sons, the remaining partners of the firm.

The Carnarvon Town Council have appointed a special committee for the purpose of securing the selection of a site in their town for the proposed Welsh museum. They are prepared to expend 120,000*l.* to 150,000*l.* in providing suitable building.

Mr. G. Gilbert Scott has lent to the Liverpool Architectural Society the working drawings of the cathedral, the meeting to be held on the 27th inst. A paper will be read by the Rev. T. W. Lund on "The Classical Architecture and Sculpture of Rome."

The Edinburgh Architectural Association presented Mr. William Page, at their dinner on Saturday last, with several volumes of standard works on architecture in recognition of his services as secretary during the past four years. Mr. Page is moving to Glasgow.

M. Marcel, Director of Fine Arts, has been appointed Administrator-General of the National Library, in succession to M. Delisle, who has retired on a pension.

A War Memorial will be unveiled in Truro Cathedral March 6 by the Earl of Mount-Edgcumbe. The architectural part of the monument is worked in grey Cornish stone, and it was designed by Mr. Frank L. Pearson, who completed the cathedral begun by his father. Part of the memorial is to consist of two bronze figures representing an officer and a Yeomanry private, executed by Mr. Nesfield Forsyth.

An Arts and Crafts Exhibition for the West Riding of Yorkshire will be opened in the City Art Gallery, Leeds, March 11, by Lord Londonderry, Minister of Education. The director of the School of Industrial Arts, Geneva, will give an address in French descriptive of the aims and objects of the school and the various means adopted to attain them.

Mr. Seton Karr has arrived in Egypt from India, where he has been engaged in explorations in the Indus Valley. Mr. Seton Karr is resuming his archaeological researches in the Fayoum, which he has been investigating for several winters past.

Northumberland War Memorial.—We are informed that the successful candidates in this competition are:—1st. Mr. Eyre Macklin, of Newcastle-on-Tyne; 2nd. Mr. C. C. Errington, architect, of Newcastle-on-Tyne; 3rd. Mr. F. Doyle Jones, sculptor, of West Hartlepool. The first-named competitor is employed to carry out the work, and premiums of 20*l.* and 10*l.* have been awarded to the second and third named respectively.

At the Ordinary Meeting of the Institution of Civil Engineers on Tuesday, February 28, the paper to be submitted for discussion is "Surface-condensing Plants, and the Value of the Vacuum Produced," by Richard William Allen, Assoc. M. Inst. C.E.

The Architect, Feb. 24th 1905.

INK PHOTO SPRAGUE & CO. LTD. 4 & 5, EAST HARDING STREET, PETER LANE, E.C.

"MOUNT STUART": ISLE OF BUTE, N.B.: THE CORRIDOR.

SIR R. ROWLAND ANDERSON, LL.D., Architect.

The Architect.

THE WEEK.

ON Monday Mr. R. PHENÉ SPIERS, F.S.A., was the principal guest at a dinner given by some architects and other artists in his honour. An illuminated address, expressing appreciation of his services to architectural education and in recognition of his aid to many students, was presented to Mr. SPIERS. It ran as follows:—"We, the undersigned architects, students of architecture and workers in the arts, desire to give expression to our regard for you, and to mark our appreciation of your scholarly attainments, and of the good work which you have done in forwarding the study of architecture during many years, in the course of which you have not only won distinction for yourself, but have done so much to help others. We also desire to record our acknowledgment of your labours in the cause of architectural education, and of the hearty aid which you have always been so ready to afford as a friend and counsellor. Many of us gratefully remember the kindness of your welcome, your constant sympathy and your interest in our student life and subsequent work." There was also presented a bronze plaque containing his portrait by Mr. LANTERI, which was inscribed as "A record of the esteem of his pupils, colleagues and friends." Reductions of it will form part of a prize which will be a memorial of Mr. SPIERS. An address and a large medal were presented by M. PASCAL, representing the Société Centrale des Architectes Français, as well as the "anciens élèves" of the atelier BLOUET-GILBERT-QUESTEL-PASCAL. M. BERLAGE and VAN STRAATEN attended as representatives of the architects of Holland. The committee have also undertaken the publication (through Mr. STAFFORD) of a volume of essays with illustrations on "Mahometan Architecture," "Sassanian Architecture," "The Influence of Greek Art on the Persian Order," and other subjects. There can be no question of the value of Mr. PHENÉ SPIERS' services to architects and architecture during more than thirty years, and which is to be hoped will be continued during a long period.

A STRIKE in the building trade of Dublin appears to be imminent. The cause of it is rather curious. The bricklayers of Dublin are willing to be paid by piecework or measurement by persons who are not regular builders. The consequence is that a good deal of building can be executed by traders who look upon building as only a part of their business. In Dublin, as in London, there are shopkeepers who are prepared to meet all demands of their customers, an arrangement which the importance of building is not recognised. The bricklayers, who under such circumstances regard piecework as perfectly legitimate, have declared that when a regular builder adopts the arrangement it becomes "an injustice to the general public, as it would establish a sweating system, and as a result bad workmanship, which, in the building trade, is a source of danger to public life and interest, in view of the attitude of the various public bodies consider it hostile to public reform." We are told that a man cannot serve two masters, for he will love one and hate the other, and the Dublin bricklayers undoubtedly exhibit such a variety of sentiment. The latter builders simply ask that regular employers should be treated in the same way as the people who are enabled to take contracts at prices far lower than those of the ordinary builders. If the strike cannot be prevented, there is no doubt the bricklayers' society must accept the responsibility.

WE have already mentioned the imbroglio in which the Corporation of Kroonstad have involved themselves in the project of a town hall. According to the latest

advice from the colony the affair has become more complicated, and is likely to give rise to several actions. As three Councils are implicated it will be difficult to assign the relative responsibility. In the first place, one Council selected a design from Messrs. J. H. & A. E. TILL, architects. Then it was rejected on the advice of the town engineer, who afterwards prepared plans for the building, which were, however, set aside. When a new Council came into office another competition was ordered, in which Messrs. LEECH & MACKEY, of Johannesburg, were successful. They were commissioned to prepare working drawings and specifications at 2½ per cent. The ratepayers had agreed to an outlay of 10,500*l.* But when an estimate was made out the amount was 14,500*l.* Thereupon the plans were rejected, but 218*l.* was paid for commission. Messrs. TILL had threatened a lawsuit in connection with their plans, and no doubt in consequence the Council resolved to adopt their plans. A week afterwards the resolution was rescinded, but subsequently another resolution was passed which was in favour of Messrs. TILL. Messrs. LEECH & MACKEY say they were not informed about the nature of the site, which was the cause of the excessive estimate, and they put in a claim to have their plans adopted. The engineer, it is said, has expressed his willingness to prepare plans without extra cost for a building which will not exceed the amount approved by the ratepayers. In spite of that inducement several members of the Council are in favour of Messrs. TILL's plans. There are consequently several RICHMONDS in the field, but what will be the issue of their rivalry remains unknown.

ACCORDING to STRUTT, in his "Manners and Customs of the English," the mystery plays were performed on three several platforms or stages, raised one above another. On the uppermost sat the *Pater Coelestis* surrounded by His Angels; on the second appeared the Holy Saints and glorified men; and the last and lowest was occupied by mere men who had not yet passed from this transitory life to the regions of eternity. On one side was a dark cavern which was supposed to be Hell. Professor MEDLEY, in a paper read before the Glasgow Archæological Society, is opposed to that view. It had been a popular idea, he said, that the miracle plays were represented on several platforms, one above another, ranging from three to nine, each stage representing different scenes or different worlds. This was not the case. In many of the plays the stage must have been on different levels, the mouth of Hell in some plays being represented on the same level as the spectators, and Paradise on a platform above the stage. There were no wings, and the whole of the action took place on one stage, the different scenes being indicated by wooden structures or scenes painted on cloth and placed upon the stage. In France the platforms were sometimes 100 feet long, and the spectators moved along from scene to scene. When plays were performed in church the different scenes were shown in the different aisles. For the pageants which were under the charge of the town guilds, large wooden platforms were constructed which moved on four or six wheels. These platforms were two storeys in height, the lower storey forming the green-room, the upper the stage. Sometimes the actors spoke from the ground; and another way by which the scene was enlarged was by cutting a square hole in the ground and filling it with water to represent the lakes and seas of Palestine or of any region that might appear in the play. Stow mentions that at Clerkenwell the parish clerks of London used to assemble yearly and to play some large history of Holy Scripture. At the Skinners' Well the performance once lasted eight days. Mr. ORDISH assumes that the people formed a circle round the well and that the scaffolds were outside them. He reproduces an old plan of the Coventry mysteries which supports his view.

THE QUANTITY SURVEYORS' ASSOCIATION.

THE most fitting ceremonial at the inauguration of any British institution for which success is desired is supposed to be a dinner of the supporters. On that account it may be believed that the Quantity Surveyors' Association came into existence last week at the repast in the Freemasons' Hall. It has, however, a history of a year or two which will have an important effect upon the future of the Association, for during that time the organisation was completed.

The necessity for such a society may not seem apparent to everyone associated with building. There is the important Surveyors' Institution with its Fellows, Professional Associates and Associates. There is also the Surveyors' Association of older date, and although consisting of few members, it is likewise influential. There are gentlemen who are best known as surveyors belonging to the Institution of Civil Engineers and the Royal Institute of British Architects. Having so many societies in which a quantity surveyor is eligible for membership, what advantage is gained by a special society?

We need not say that it is open to a few or many individuals to form themselves into a society. It is only when they interfere with the privileges of the members of other societies that opposition can be raised. Neither the Surveyors' Institution nor the Surveyors' Association would, we imagine, attempt to interfere with the incorporation of a society for quantity surveyors. Even if some members were drawn from the older bodies, it would have to be realised that the new society had a right to existence because of its definiteness, for that is the quality which is wanting in the other societies we have mentioned.

Indeed, it must be recognised that the English language displays its weakness in relation to surveying. What is a surveyor? JOHNSON could only define the word as an overseer or a measurer of land. But a great many successful surveyors in this country are not overseers or measurers. The Surveyors' Institution is undoubtedly one of the most successful professional societies in the world. If the annual income of the members could be calculated, it would probably be equal to that of the members of the Institution of Civil Engineers. But the variety of the occupations by which the money is gained is remarkable. Some are civil engineers, others are architects; there are several barristers who find it profitable to be entered on the list of associates. Districts in England could be named in which the most important resident is a member of the institution. He controls the land, and with it the population. Irish land agents are endeavouring at the present time to obtain remuneration from the Treasury on the grounds that they are professional members of the institution, and have lost their appointments through recent legislation. But if a lady is in search of lodgings in a country town or a seaside resort she is likely to have recourse to one of the fellows who, as part of his business, is ready to let houses or parts of houses. It is, further, not unusual to see announcements of auctions by fellows, and, in fact, the members follow a diversity of businesses, including the collection of rents, arrangement of mortgages, road-making, upholstery, valuing live and dead farming stock, &c. No objection can be raised about the respectability of all the different classes of work. They require skill, judgment and honesty, but it cannot be said they have much in common with the analytical work which is known as taking out quantities. Indeed, one can hardly imagine a successful land agent, auctioneer or valuer for probate going over plans with a scale, unless at a price which would amaze building owners and architects. It is, in fact, a case of general practitioners *v.* specialists, but in a new form, and the specialists having the smaller fees.

There is no doubt about members of the Surveyors' Institution having quantities taken out in their offices, and auctioneers, collectors and others would if a profitable opportunity arose make arrangements to

have the work done, and would employ assistants for that purpose. But under such conditions there exists a likelihood that the work will be performed in a manner which would differ from that followed by quantity surveyors who can claim to be experts. It should be understood that there is really only one proper way of taking out quantities, and that is by presenting all the varieties of work in detail. Some may say—and there may be builders to agree with them—that detail can be carried too far, and that a contractor who has experience will prefer to deal with the items in a more comprehensive way. In other words, guessing is preferable to exact measurement. But quantities would never have been needed if it were possible to lump a contract and at the same time to be just towards the building owner. It is not to be expected that a builder who only takes a summary view of what he has to do will be in different to his own interest and fail to provide for all possible contingencies, and especially his own under-estimating the work which will have to be performed. His calculation of cost will be liberal towards himself, and indeed in such cases no prudent man would err on the side of economy. When there is a bill of quantities guess-work is avoided, the client pays for the work which is executed, and the builder receives a profit on the materials he has supplied and the work he has carried out.

The fact that there is not uniformity in the method of taking out quantities throughout Great Britain is evidence of the complexity of the operations, and the difficulty of overcoming the old ways of estimating a random. It also suggests the difference when quantity taking is made a special occupation and when it is mixed up with several other duties. An assistant who after a few hours engaged in taking off, has to give his attention to making drawings or other office work cannot always be expected to be in the mood which correct measurement demands. It is, however, generally recognised that what is known as London practice is the most satisfactory. It may, therefore, be anticipated that with a society such as the Quantity Surveyors' Association, having only one aim, and as a result of bringing members together from all parts of the country, there would be in course of time uniformity of practice, and of its desirability there can be no question.

The Association would serve another purpose which now demands attention. Of late years, and as one of the results of a national system of education, there arises an aspiration among young men to seek occupations of a different kind from those followed by their fathers. It is believed not merely that wealth is more quickly acquired in that way, but that a comparatively exalted social position can be attained. Hence it is that there are so few genuine trade schools and so many technical schools, that are believed to give facilities for acquiring knowledge, which is reputed to confer professional status. Judging by the advertisements it would appear as if quantity surveying is one of the courses which is most in favour. It would be wrong to say a word against any kind of study which can be legitimately pursued. The students may be able to pass the examinations which are arranged by authorities, and to obtain certificates to that effect. But it is not supposed to be the business of authority to care whether the certificated students are capable of doing the work in a manner which would satisfy architects, builders and building owners. Nor is the examination by any of the older societies a sufficient test. The Quantity Surveyors' Association has a right to claim the support of all who are associated with building when it proposes that all the future members should demonstrate their capacity by undergoing practical training. When we consider the multifarious duties for which a member of the Institution of Surveyors is presumed to be equal it would be absurd to expect that he would be as skilled in the taking out and billing of quantities if his whole life was to be devoted to that class of work.

If the Association by examinations or other means can render surveyors efficient it will be a great advantage, and especially to builders. The case of *PRIESTLEY & GURNEY v. STONE* has demonstrated that the old belief about the responsibility of a surveyor for the accuracy of quantities is elusive, and can only be secured by an express stipulation in the contract deed.

There is another point with which the Association would like to deal, but which is still more difficult. Efforts are made to obtain work at much lower rates than those which are supposed to be normal. It is to be regretted that surveyors do not realise the consequences of lowering their fees, for every concession is likely to be followed by a demand for a still greater one. The economic law of supply and demand applies to quantities as to things of inferior value. When there are many surveyors and the work is restricted, the struggle for existence is witnessed in all its sternness and sacrifices have to follow. How it will end there is no foreseeing. But if it can be recognised that the preparation for performing a quantity surveyor's duties is no trivial task, aspirants may be less disposed to go through the ordeal, especially if they become aware of the conditions of the market which they have to face. There is no room in surveying for a great variety of ability. All must be equally accurate and equally careful. It is to be hoped the Association will be enabled to make arrangements to secure a uniformity which will remove at least some of the hesitation about making quantities a part of the contract, an arrangement of which the equity is beyond dispute.

ARCHITECTURAL VARIATIONS.*

IF the success of the "History of Architecture," by Messrs. FLETCHER, is without precedent, it must be admitted that great efforts have been made to render each new edition an improvement on its predecessor. Originally the volume consisted of 313 pages. In the fifth edition there are 738 of larger size, an increase of about 200 pages over the fourth edition. At first there were 115 plates; in the latest edition there are 199, but as many of them contain reproductions of several independent drawings the number of plates is an inadequate test, and it is more correct to say there are about 2,000. The additions are to be found in the most important sections. The part relating to Greek architecture is doubled; the Roman, Gothic and other sections are also enlarged. By the aid of photography general views are presented of the most important buildings which have survived, whilst other drawings are given containing plans and details. The plates, therefore, appeal to the understanding as well as to the eyes, and a glance over them will be sufficient to enable a novice to form some notion of the various styles of architecture, whilst on the other hand the earnest student will find that a long time will be required before he is able to exhaust all the characteristics which are brought under his notice.

It is an advantage to have all the varieties within the compass of one volume. Every geographer concedes it is indispensable to have a map of the world, whether in hemispheres or on a MERCATOR'S projection, in order to realise the relations of the different countries to one another. For a somewhat similar reason it is well to have the different styles of building brought together, for in that way we can perceive with difficulty the growth and decay of the successive variations by which man served his purposes or displayed his ostentation. As everyone knows, it is impossible to formulate many architectural theories, and having such plates as are found in Messrs.

FLETCHER'S History they can be easily tested. If, for instance, we suppose that the difficulty of covering or roofing an area was the principal factor in the determination of styles we can grasp without difficulty all that is signified by the statement. Or we can substitute lighting for roofing, and the plates will supply us with sufficient evidence. There is, in fact, so much systematised information crowded into the plates, we can well understand why enlargements of them should be prepared for the use of lecturers and other teachers. They certainly could easily be made auxiliaries in technical education. As diagrams they are deserving of unstinted praise.

The aim of the authors is to show that styles are due to the following influences: geographical, geological, climatic, religious, social and political, and historical. That, however, does not give sufficient importance to the artistic influence, and which probably was always of an individual character. We might add that in many cases it was nothing but improvising. In his "Ten o'clock Lecture" Mr. WHISTLER traced the origin of art to some lazy fellow in pre-historic times, who, instead of going hunting or warring with the other members of the tribe, remained in the cave and amused himself by scratching or burning lines on a gourd. The lines pleased the savages and were imitated. SEMPER'S theory did not differ much from WHISTLER'S, for he believed architectural ornament began with the lines formed by barbarian needlewomen. In treating a subject on the comparative method, it may seem as if some great cosmic forces were always at work. It is more likely that everything relating to form has had an origin with an individual. KANT says that "in man, as the sole rational creature upon earth, those tendencies which have the use of his reason for their object are destined to obtain their perfect development in the species only, and not in the individual." But how many cases can we find recorded of the invention by the species of any innovation either in construction or in form?

Take, for instance, the history of the dome. Some believe it was one of the earliest of all forms of construction, for with clay and wattles it was not difficult to undertake. Between the first attempt and the Pantheon there must have been innumerable attempts by individuals. The great Roman dome might be supposed to exemplify the knowledge of generations, which would be transmitted to posterity, enabling builders in later ages to excel the great work of HADRIAN'S time. But when ARNOLFO wished to cover the cathedral at Florence he appears to have started as if he had to deal with a problem that was hitherto unsolved. What is more remarkable, however, is that BRUNELLESCHI had also to attempt an independent solution, and so little general knowledge existed on the subject of domes, it was with much misgiving he was allowed to make the experiment. In fact geography, geology, climate, religion, politics and history were apparently of no avail. Our History says in treating of Florentine work:—"Having reached the period when the personality of the architect has increased in importance, the chief works of BRUNELLESCHI, ALBERTI and others, as being leaders of the Florentine school, will be briefly enumerated." We doubt if there was any difference between the artists of the new era and the old as regards invention. In both cases new ideas originated with individuals. But in Florence during the fifteenth century there were people who put on record what was done by individuals, whilst in an earlier time there was no provision of that kind, or it was not considered necessary.

Let us also take an example from construction. At the present time the great question is whether a metallic skeleton is to be adopted more generally for buildings. That beams and columns of wrought and cast iron and steel have been in use for several years everyone knows. But in America, where the skeleton system has been developed to a remarkable extent, it is generally agreed

A History of Architecture on the Comparative Method, for Student, Craftsman and Amateur. By the late Professor Banister Fletcher and Banister F. Fletcher. Fifth edition, revised and greatly enlarged by Banister F. Fletcher. London: C. Batsford.

that the credit must be given to Mr. JENNEY, of Chicago, who in 1883 persuaded clients to allow him to erect an office building of ten storeys. In spite of the immense power of companies recourse must still be had to individuals when designs are needed. The steel beam corresponds with the wrought-iron beam which was devised by WILLIAM FAIRBAIRN and patented by him. It might be imagined that the adoption of iron construction was, so to speak, in the air, but the risks had to be originally accepted by individuals. We believe all variations of details which are employed in architecture originated in a similar way. There might be, as in the Mediæval times, cities or districts which wished to possess a higher building or a more spacious one than their neighbours. But that signified their belief in a particular architect, and their resolve to have his design carried out in preference to any other. No doubt the personal factor was obscure during long ages, but apparently it will always exist, and is the most important of all influences. Co-operation has many advantages, and it is essential in great undertakings, but it has yet to be demonstrated that it has the power of designing.

The editions of "The History of Architecture" are not yet at an end, and in some future one we hope to see explained how close is the relation between successful works and individual designers. In our time there is a danger of confounding artistic efforts with the operations of nature, in which the agents are mechanical or chemical forces. Art has a character of its own, and although the artist will endeavour to please the society of which he is a member, his best work derives its interest from his own delight in it as its creator.

THE PUBLIC HEALTH ACTS, 1875 AND 1890.

WHEN is a sewer not a sewer? The answer to this conundrum, as given by Parliament in the Public Health Act of 1890, is, "When it is a single private drain," but this oracular utterance of the Legislature has occasioned many disputed cases before its application to the actual world of pipes and drains has been ascertained. The meaning of the sections of these two Acts which apply to this question is of the utmost importance to building owners of property. It will be most clearly seen if we look at the reasons which have given rise to their enactment, and at the cases which have at last, after much expenditure of judicial power, wrested from them the intelligible meaning which the Legislature did not apparently think it worth while to take the trouble to express.

Under the Public Health Act, 1875, a pipe used for the drainage of one building was and is a drain and repairable by the owner of the building, while a pipe used for the drainage of more than one building was for all purposes a sewer and repairable by the local authority. Under that Act the local authority could insist upon the owner of each building connecting his building with the sewer by a separate drain. This requirement was found to be inconvenient by building owners who were erecting several houses in close proximity to one another. To suit their views it was in many cases provided by local Acts, that the local authority should be able to come to an arrangement, whereby the building owner was authorised to make a single pipe for several buildings, conditionally upon his undertaking to be liable for its repair. This was a convenient arrangement and worked well so long as the buildings in question remained the property of the building owner who had entered into the arrangement. Difficulties arose when the building owner sold his houses to different purchasers. With a view to meet these difficulties the Public Health Act, 1890, provided (Section 19) that, "where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under Section 41 of the Public Health Act, 1875 (relating

to complaints as to nuisances from drains), and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of the houses in such shares and proportions as shall be settled by their surveyor, or (in case of dispute) by a court of summary jurisdiction. . . . For the purposes of this section the expression 'drain' includes a drain used for the drainage of more than one building."

No doubt this section was meant to deal with a case well known both to building owners and local authorities. No doubt it would carry a very intelligible meaning to persons who understood the circumstances and the special cases which it was meant to meet. But it wants a quality which all legal documents, and especially Acts of Parliaments, should possess, the quality, namely, of being clear to intelligent persons who either do not know these circumstances or who cannot take them into consideration. The judges who are obliged to interpret an Act of Parliament are not necessarily conversant with the modes in which building owners carry on their business, and, if they are, they cannot take such extraneous circumstances into consideration in interpreting the words of an Act of Parliament. Hence this section has given rise to many conflicting cases and a large expenditure of costs. The Public Health Act of 1875 had drawn a clear distinction between a drain and a sewer. It was a little puzzling to suddenly meet in an amending Act a *tertium quid* called a "single private drain," which was for some purposes a sewer, for others a drain. Thus we find one judge doubting whether the section applied at all to the case of a row of houses drained by a single pipe. Another very reasonably inquired why the section applied only to the case where two or more houses belonged to different owners, and not to the case where they belonged to one owner. As we have seen, a reason might have been given if it had been possible to go into the circumstances which called for the passing of the section; but the circumstances were neither described nor referred to in it. Again, the section left the procedure to be followed by the local authority, in cases contemplated by the section, very much in the dark.

Two cases recently decided in the Court of Appeal—*THOMPSON v. Eccles Corporation* and *HAEDICKE v. Friern Barnet Urban Council*—go far to settle the difficulties. These cases, following the decision in *BRADFORD v. Eastbourne Corporation*, decided in 1880, have made it clear that, when a pipe is originally constructed to connect the houses of several owners with the sewer, it is a single private drain, and is repairable by the owner and not by the local authority. Such a drain is distinguished from a sewer in that it is not a drain which any member of the public can use; and such a drain, though defined as a sewer for the purposes of other sections of the Public Health Acts, is a drain for the purposes of the section which regulates the liability to repair. These cases also clearly show that the procedure to be followed by the local authority is the procedure indicated in Section 41 of the Public Health Act, 1875. The section does not mean that on an application of any person alleging that a nuisance exists the local authority must do the work and recover the expenses. It means that the local authority can after a written notice to the occupier, or, in a case of emergency, without notice, enter the premises and examine the drain. If the drain is found in good condition the local authority must make good any damage caused. If the drain is found to be defective notice must be served on the occupier to do the necessary work. If he does not do it, penalties are imposed, and the local authority which does the work can recover its expenses. The drain may be defective either in one place or in several. And according to the locality of the defect or defects the local authority must give notice to either one occupier or several occupiers to do the necessary work. If the local authority is obliged to do the work itself it may apportion

expenses among the owners who should have abated the nuisance.

The law as thus ascertained by the good sense of the Court of Appeal is very reasonable. It is a pity, as we have said, that Parliament should, by ill-considered draftsmanship, have made it necessary to go to the Court of Appeal to arrive at this construction. But a learned judge has said that "the whole of our sanitary legislation is in a state which I hardly like to characterise in the language which naturally suggests itself." If the wording of these Acts produces in the minds of His MAJESTY'S Judges a desire to use language which they feel would not be altogether consonant with their dignity, we imagine that we should hardly dare to publish the language of the building owners at whose expense this wording has been elucidated.

SIR JOHN SOANE AND HIS MUSEUM.*

JOHN SOANE was born at Whitchurch, near Reading, on September 10, 1753. His father was a builder and mason, and sent him to a school in Reading kept by a Mr. Baker, where he received a good education. When Soane was fifteen years old, Mr. George Dance—who was architect to the City of London and Professor of Architecture at the Royal Academy—having seen the youth and found him possessed of much ability, gave him an engagement in his office. Subsequently, with the concurrence of Mr. Dance, he entered the office of Mr. Holland, and under these two distinguished architects acquired his taste for, and first knowledge of, architecture.

He became a student of the Royal Academy, gained the silver medal in 1772, and in the same year exhibited his first drawing at the Royal Academy. In 1776 he was awarded the gold medal for the best design of a triumphal bridge, a work showing great originality. Sir William Chambers was greatly struck with the talent evinced by the young architect, and brought him to the notice of the king, who nominated him for the travelling studentship of the Royal Academy. This he held for three years, receiving an allowance of 60*l.* per annum, with a like sum for travelling expenses. In March 1777, Mr. Soane left London for Italy, and during the three years of his study there he worked very assiduously, measuring and drawing the ancient buildings and producing many original designs. While there he made a second design for a triumphal bridge, and having sent it to the Academy of Fine Arts at Parma was, in June 1780, elected a member of that Society. He made many valuable acquaintances while in Italy, whose friendship he retained in later years, among them Mr. Thomas Pitt, afterwards Lord Camelford. He returned to London during 1780 and commenced practice on his own account, apparently with much success.

About eight years later he married Miss Smith, niece to Mr. Wyatt, a builder of considerable reputation, and shortly after succeeded to a considerable fortune, through his wife, upon his death.

He received on October 16, 1788, the important appointment of architect and surveyor to the Bank of England upon the death of Sir Robert Taylor. The Bank was at this time quite a small building, with a frontage of about 80 feet in Threadneedle Street, having the church of St. Christopher-le-Stocks abutting on the west, and on the other sides a number of dwelling-houses and three taverns. These were all pulled down, and Mr. Soane erected in their place the present structure, very little of the old Bank being retained. He took as his models for many parts of the building the Classic examples he had studied so well in Italy. The Lothbury Court was adapted partly from the beautiful Temple of Vesta at Tivoli, and the noble archway leading to the Bullion Court from the Arch of Constantine at Rome. The chief cashier's office was designed in the style of the Temple of the Sun and Moon at Rome, and the Three per Cent. Consols Office from the ancient Roman Baths. Great difficulties had to be encountered in the construction and arrangement of his plan, which were overcome by Mr. Soane with great skill and ingenuity. He held the appointment to the Bank for forty-five years.

In 1791 he was appointed clerk of the works to St.

James's Palace and the two Houses of Parliament. The committee of the House of Lords directed him in 1794 to consider and advise them what alterations could be made to render the offices and other rooms more commodious. He prepared designs, but they were not carried out. In 1795 he received the appointment of architect for new buildings and repairs in the royal parks, woods and forests. In the same year he was elected an Associate of the Royal Academy, and in 1802 a Royal Academician.

Upon the death of Mr. George Dance in 1806 Mr. Soane had the distinguished position of Professor of Architecture to the Royal Academy conferred upon him. His lectures were well attended, and he was able to make his influence considerably felt among his students. The lectures were at that time limited to a series of six, and he chose as his subject the Classic architecture of Ancient Greece and Rome and its revival in Italy as practised by Palladio and the architects of his school.

In 1815 Mr. Soane received the appointment of architect to the Office of Works, and amongst the buildings carried out by him during his occupancy of the post were the Law Courts by the side of Westminster Hall; the Scala Regia, Royal Gallery, library and additional committee-rooms in the House of Lords; the library and additional committee-rooms in the House of Commons; the offices of the Board of Trade and Privy Council Offices in Whitehall, and the new State Paper Office in Duke Street, Westminster, his last work.

He was a Fellow of the Society of Antiquaries, Fellow of the Royal Society and Grand Superintendent of Works to the United Fraternity of Freemasons.

On September 21, 1831, Mr. Soane received the honour of knighthood from His Majesty King William IV., and shortly afterwards relinquished his professional work and devoted himself to the completion of his house and the arrangement of his museum and library.

Sir John Soane probably commenced acquiring his collection of antique marbles and casts during his early days in Italy. They served as works of reference for himself, and later became of great value as illustrations for his pupils, in his time such examples being scarcely known in this country. He was always adding to it, and having fortunately the means, he spared no expense to make both his library and collection of antiques and works of art as complete as possible, and one that might prove of service to "amateurs and students in painting, sculpture and architecture."

He conceived the idea of leaving his collection to the nation for the benefit of future generations, and in 1833 he obtained an Act of Parliament, intitled "An Act for settling and preserving Sir John Soane's Museum, library and works of art in Lincoln's Inn Fields, for the benefit of the public, and for establishing a sufficient endowment for the due maintenance of the same."

Sir John Soane died at his residence, 13 Lincoln's Inn Fields, on January 20, 1837, and was laid to rest in the old burial-ground of the parish of St. Giles in the Fields, at St. Pancras.

Sir John was devotedly attached to his profession and fond of literary pursuits. In him we find an admirable example of an individual rising by his own talent and energy from a humble position in society to one of considerable wealth and influence.

The architects of England in 1835 had a medal struck in his honour, and presented him with impressions in gold, silver and bronze, to show their high appreciation of the great services he had rendered to architecture during his professional career.

Among the works carried out by Sir John Soane not already mentioned are the following:—Mansion for the Duke of Leeds in St. James's Square; Buckingham House, in Pall Mall; Praed's Bank, 189 Fleet Street; Grote, Prescott & Co.'s bank, Threadneedle Street; Trinity Church, Marylebone Road; the Gothic Library, Stowe House, Bucks; the picture gallery at Dulwich College; the National Debt Redemption and Life Annuities office in Old Jewry, and the Grand Masonic Hall in Great Queen Street.

The Soane Museum was built by Sir John in 1812 as his private residence, and it remains almost as he left it at his death. The collection is arranged in some twenty rooms, in a most ingenious manner; no space seems to have been lost, and wherever you look there is something of interest to be seen. In the picture-room, which measures only 13 feet 8 inches by 12 feet 4 inches, and 19 feet 6 inches in height, by an arrangement of movable planes or shutters, on the front and back of which and inside wall are fastened

* A paper read by Mr. Frank E. Spiers at the visit of the members of the Upper Norwood Athenæum to the Soane Museum, Lincoln's Inn Fields.

the pictures, the actual wall-space of a room 45 feet by 20 feet has been obtained. One room is fitted up as a "monk's parlour," and looks out on a yard in which Gothic fragments that were taken from the old House of Lords have been arranged to represent a cloister. It is not possible in this account to describe or enumerate more than a very few of the principal objects of interest in the collection, or to point out where they may be found; such information can be best obtained from the published handbook.

Undoubtedly of chief interest and value is the beautiful alabaster (arragonite) sarcophagus discovered by the explorer Belzoni, in 1817, in the Valley of the Tombs of the Kings, near Gournou, Thebes, and purchased for 2,000*l.* by Sir John Soane from Mr. Salt, Consul-General in Egypt, after having been offered to and refused by the British Museum.

Belzoni thus describes it:—"It is a sarcophagus of the finest alabaster, and is transparent when a light is placed inside it. It is minutely sculptured within and without with

"Remains of Kirkstall Abbey;" numerous drawings and designs by Sir John Soane; fifty-five folio volumes of original architectural drawings by Robert and James Adam; several portraits of Sir John Soane, Mrs. Soane and their two sons; portrait of Napoleon Bonaparte in his twenty-eighth year, by Francesco Goma, a Venetian artist; miniature portrait of the Emperor Napoleon by Isabey, painted at Elba in 1814; antique marble statues of Diana of the Ephesians and Esculapius; bust of Sir John Soane, by Sir Francis Chantrey, R.A.; Sir Thomas Lawrence, P.R.A., by R. W. Sievier; of Sir Christopher Wren, Inigo Jones, J. Flaxman, Sir William Chambers, George Dance; of William Pitt, by Flaxman; and of Shakespeare, from his monument in the church at Stratford-on-Avon. Models in plaster of the Board of Trade and Privy Council Offices, Whitehall, and of ancient buildings in Italy and Greece; models in cork of Stonehenge, Pompeii, Triumphal Arch of Constantine at Rome, and several Classic temples; carved and gilt ivory table and four chairs from Tippoo Sahib's

SIR JOHN SOANE'S MUSEUM.

A GROUP OF STATUARY.

several hundred figures, united with several emblems, &c. I cannot give an adequate idea of this beautiful and invaluable piece of antiquity, and can only say that nothing has been brought from Egypt that can be compared with it." It contained the remains of Seti I., of the nineteenth dynasty, who reigned about 1350 B.C., and was the father of Ramses II. (The Great).

Paintings by Hogarth (series of four), "The Election," purchased at Mr. Garrick's sale in 1823 for 1,650 guineas; (series of eight), "The Rake's Progress," purchased in 1802 for 570 guineas; paintings by Canaletto, "The Grand Canal, Venice," "The Piazza, San Marco, Venice," and view of "Venice with the Rialto;" portrait of Sir John Soane by Sir Thomas Lawrence (1829), one of his last works; "The Snake in the Grass," by Sir Joshua Reynolds, R.A.; "Admiral Tromp's Barge entering the Texel in 1645," by J. M. W. Turner, R.A.; "Oberon and Titania contending for the Indian Boy" and "Vision of Shakespeare," by Henry Howard, R.A.; also by the same artist the paintings on the ceilings of the library and dining-room, representing "Phœbus in his Car," "Pandora," "Epimetheus receiving Pandora," "The Opening of the Vase," "The Seasons" and "Night;" "Cave of Despair" from Spenser's "Faery Queene," by Sir Charles Eastlake, P.R.A.; drawings by J. M. W. Turner, R.A., of "The Valley of Aosta" and

Palace at Seringapatam; fine astronomical clock by Raingo of Paris; richly-mounted pistol taken by Peter the Great from the Commander of the Turkish Army at Azof in 1696; collection of gems, cameos, intaglios, &c.; medals, bronzes, pottery, antique vases, and treasures of all kinds. In the library, which contains upwards of 8,000 volumes, I will only mention the first three folio editions of Shakespeare's plays, 1623, 1632 and 1664, these formerly belonged to Kemble; Boydell's Shakespeare; and the extra illustrated copy of Pennant's London, formerly belonging to Henry Fauntleroy, and purchased by Sir John Soane for 650 guineas. Some valuable MSS. are also to be found here, among them a beautiful volume illuminated by Giulio Clovio (about 1540), a pupil of Michel Angelo and friend of Raphael; the second volume of a French translation of Josephus, fifteenth century, bearing the arms of Edward IV. (the first volume is in the Bibliothèque Nationale at Paris); and the original MS. of the "Gerusalemme Liberata," by Torquato Tasso, 1560-70.

Amongst the authorities consulted are:—Sir John Soane's description of the Museum, "Review of the Professional Life of Sir John Soane," by J. L. Donaldson 1837; "Old and New London," by Walter Thornbury 1837; "Old Humphrey's Walks in London," Bohn's "Handbook of London," and Murray's "Handbook of London."

THE NEW BERLIN CATHEDRAL.

ON Monday last the new cathedral in Berlin was dedicated. The cathedral, says the *Times*, stands upon the site of the humbler edifice which was erected between 1747 and 1750 by Frederick the Great and restored in 1820 by Frederick William III. The former church was the scene of many significant events in Prussian history, such as the thanksgiving services held after the Seven Years' War, the Napoleonic wars, and the Franco-German War of 1870. It was here that the body of the Emperor William I. lay in state from March 12 to 16, 1888, and hence, after a funeral service attended by representatives of all the Royal Houses of Europe, the remains were conveyed to the mausoleum at Charlottenburg. The vault under the old Dom contained the remains of at least nine rulers of Brandenburg and Prussia and their consorts, as well as of some eighty or ninety princes of the reigning house. Among the sarcophagi which have been transferred to the crypt of the new cathedral are those of the Great Elector of Brandenburg, King Frederick I. of Prussia, and King Frederick William II. It was only after the establishment of the Empire in 1871 that the idea of erecting a metropolitan cathedral worthy of Protestant Germany took practical shape in the minds of the Crown Prince and Crown Princess, afterwards the Emperor and Empress Frederick. The Crown Prince entrusted the preparation of the plans to the architect Geheimer Baurath Raschdorff, but the design, which was published in 1890, was officially described as the Emperor Frederick's own. The foundation-stone was laid by the present Emperor on June 17, 1894, so that the work has been executed in less than eleven years. The site, which is close to the eastern arm of the Spree, on the island which contains the Royal Castle and the great edifices of the Royal Museum and National Galleries, necessitated very elaborate foundations. These were obtained by driving piles into the sandy bed of the river, and, indeed, the east side of the cathedral rises straight out of the water.

The new edifice, a basilica, is built of Silesian grey sandstone in the style of the Italian Renaissance, covers an area of 6,370 square metres, and has a content of 250,500 cubic metres. The central cupola with the cross which surmounts it reaches a height of 114 metres (about 374 feet), or nearly 79 feet less than the height of the dome of St. Peter's in Rome and over 9 feet more than the height of St. Paul's in London. The total length of the building is 114 metres (over 374 feet), and its breadth 73 metres (nearly 80 feet). The chief façade and the main entrance on the west side are characterised by an elaborate arrangement of corniced pillars, which is repeated in the second storey supporting the central dome, and the dome itself is flanked by four minor cupolas surmounting open square towers, the cornices of which are also supported on pillars. Over the arch of the great portal is a colossal statue in bronze by Schaper representing Christ in the attitude of benediction. It is flanked at the corners of the minor towers and at the base of the second storey by the figures of the twelve Apostles, executed by well-known German sculptors. In front of the façade a broad flight of steps leads to a spacious entrance hall, connected by five doorways with the central portion of the church, known as the Predigt Kirche, which has the form of an irregular octagon. Facing the entrance is the semicircular apse containing the altar, at the back of which are three rectangular windows, the stained glass of which represents the Crucifixion, the Nativity and the Resurrection. The central portion of the church under the dome is that which will ordinarily be used for the divine service. In the north-eastern of four semicircular niches which are placed at diagonal points in this central edifice is the pulpit, and above the other three niches, supported by pillars of black Labrador marble, are stone balconies, which will respectively constitute pews for the Court, the Prussian Ministry and the choir. Above the last of these is the organ, a gift of Prince Henkel von Donnersmark. It was built by Sauer, of Frankfurt-on-the-Oder, has 114 stops and is the largest in Germany. The Royal pew has a separate entrance and staircase. Modern German glass mosaic has been lavishly employed in the decoration of the interior of the cupola and in other suitable portions of the building. In the cupola the mosaic-work illustrates the Beatitudes in groups designed by the painter Anton von Werner. The apse is especially rich in colour, and the altar, a plain table of white marble, supported by pillars of coloured marble, is surmounted by a shrine which exhibits gilt-bronze figures of the twelve Apostles after designs by Rauch. Over the eight giant pillars which support the central portion of the

edifice are the statues of the Reformers, Luther, Zwingli, Calvin and Melancthon, and of the four German Sovereigns who promoted the Reformation, Duke Albrecht of Prussia, the Elector Joachim II. of Brandenburg, the Elector Frederick the Wise of Saxony, and the Landgrave Philip the Magnanimous of Hesse.

To the south of the central area of the church and separated from it by folding doors are the portions of the edifice which are styled respectively the Church for Monuments (*Denkmalkirche*) and the Church for Baptisms and Marriages (*Tauf- und Trauungskirche*). From the former steps lead down to the crypt, which extends under the greater part of the building, and is lighted from without as well as by electric lamps. The so-called Church for Monuments is surrounded by five chapels, and is at present devoid of all ornament except the red marble columns which support the arched roof and the entrances to the chapels, the square pilasters of which are of yellow, red and green veined Mexican onyx-marble. The proportions of this part of the edifice are at present its most imposing feature. The side chapels will, however, contain a projected monument to Prince Bismarck and the existing sarcophagi of King Frederick I. and his Queen, and of the Elector Johann Cicero, as well as such other monuments as the Emperor William may ultimately ordain. The cathedral, which has been erected at a cost of 10,000,000 marks (500,000*l.*) voted by the Prussian Diet, represents the first Protestant Dom erected in modern Germany, and it is intended by the Emperor William to be the Metropolitan Protestant Church of the German Empire.

SKOPAS AND LYSIPPUS.

A LECTURE was given by Professor Ernest A. Gardner at University College on "Recent Discoveries in Greece," and dealt with new works of Skopas and Lysippus. Having referred to the well-known works of Skopas as architect of the temple at Tegea, in Arcadia, he pointed out as characteristic of Skopas's work the extreme mobility of the muscles round the eyes and the expression of passion. Newly discovered fragments of the Tegean pediment included a head of Herakles, in which the heavy mass of flesh over the brow, the half-open mouth and the intensity of expression were very noticeable. Illustrations were given of the recently discovered torso of Atalante and a separate head thought by some to be that of Hygieia, and Professor Gardner remarked that during his visit to this historic site in the spring of last year he was able to satisfy himself that the torso and the head, previously considered as in no way connected with each other, were really parts of the architectonic statue of Atalante for the pediment of the temple. It would appear that Skopas intentionally used the finer-grained Parian marble for Atalante, the heroine of the group, and the figure of her is much better preserved than the other parts of the pediment, and in every way tends to reveal a possible work of Skopas's own hand. Another recent discovery, a statuette of a Mænad, moving with an almost dancing step, now at Dresden, was a very Skopaic work. Dealing with the works of Lysippus he showed an illustration of the Apoxyomenos in the Vatican, which has hitherto generally been considered characteristic of the Sicyonian artist in bronze. He contrasted the sketchy, facile and all-round development of the muscles of the statue of the Pancratiast Agias found at Delphi with the sinewy, more anatomical, and more laboured work of the Apoxyomenos. The deductions that could most safely be made from this and other recent discoveries in Greece tended to show, said the lecturer, that the Delphi statues, among which the Agias is to be included, must be considered as a series of replicas in marble of bronze originals set up at Pharsalus, in Thessaly. It was reasonable to assume that Lysippus, who worked almost exclusively in bronze, employed pupils to turn out a set of copies in marble of the same bronze originals for Delphi. Discussing the very Lysippean portrait of Alexander the Great in the Ephesus room of the British Museum, and remarking on Alexander's upward intense gaze and other remarkable similarities in it and the Agias of Lysippus, he showed that in all probability both works are from the hand of the same Lysippus, who was, to all practical purposes, the Court statuary of Alexander.

Mr. Albert C. G. Jahn, at present headmaster of the Wolverhampton School of Art, has been appointed headmaster of the Sheffield Municipal Technical School of Art at a salary of 500*l.* per annum.

NOTES AND COMMENTS.

THE Manchester Corporation are eager to obtain possession of the site in Piccadilly occupied by the Infirmary. It is considered that as soon as the new Infirmary in Stanley Grove can accommodate 300 patients, the transfer of the existing Infirmary is to take place. The Board of Management of the Infirmary interpret the Act in another way. It is said that the scheme in contemplation of both parties at the time when the terms of the Act were settled was that the new Infirmary should afford twice the accommodation of the existing Infirmary, and it is only when an infirmary in accordance with the scheme is ready for the reception of the patients in the existing Infirmary that possession is to be given to the Corporation. The report from Messrs. E. T. HALL & JOHN BROOKE, the architects of the new building, states that with the exception of the laundry, east surgical block, and some subways, all the working drawings for the foundation contracts were in the hands of the quantity surveyor, and that it was hoped to have the last drawings finished in two or three weeks. The first bills of quantities would be sent to the competing contractors by the end of this month, and the architects expected that the whole of the bills of quantities would be in their hands by the end of March, and that the tenders would be in by the middle of April.

WHEN the falls at Foyers were proposed to be used for industrial purposes there was a little outcry among lovers of the picturesque, but it was not sufficient to prevent the cascade from being appropriated. In Italy industry has had to succumb to old associations. Arrangements were completed to make over the well-known falls at Tivoli to a company. But the Government appointed a commission, with the result that the company will have to look for a waterfall elsewhere, and to accept about 6,000*l.* in compensation. It is not to be supposed that so much water-power was allowed to remain up to the present ignored. There are several cascades about Tivoli, and those formed by the waters of the Anio were long used in connection with an iron foundry. The fall near the Temple of the Sibyl, which at one time descended into the Gulf of Neptune, does not now correspond with what is seen in old paintings. In 1826 there was a great flood, which destroyed over thirty houses. It was necessary to make many changes, but it is generally believed that the effect is inferior to that at the beginning of the nineteenth century.

THE old Egyptian gallery in the Louvre corresponded with the ideas which were generally accepted about the character of the ancient people at the time when BUONAPARTE invaded Egypt. Everything about them was supposed to be severe, cold, mechanical. All the works in granite or basalt were believed to be executed according to fixed rules. In the course of the century the early ideas were modified. It is only necessary to pass from the old Egyptian gallery to the salle which was opened last week in order to realise the change which has come over Egyptology. It might easily be imagined that the contents of the new salle were modern creations intended to correspond with modern theories. Instead of exhibiting detached objects from a tomb the French authorities have been able to transport a complete sepulchral chamber. The walls are adorned with bas-reliefs which reveal the ordinary life of a country gentleman 6,000 years ago. He had live stock to look after. He had crops to gather in, accounts to keep, servants who required control by a strong hand, and if he had time he could amuse himself with fishing, listening to music, or dancing. Evidently freedom was allowed to the artist, for the figures do not suggest that they were determined by the proportions which the priests ordered. There are already engravings and drawings of similar scenes, but the Louvre examples possess a character of their own and form a new attraction which visitors from all lands will admire.

SOUTH DOORWAY OF THE CHURCH OF ST. PHILIBERT, DIJON.

A SHORT distance to the south-east of the cathedral rises the ancient church of St. Philibert with a fine tower and spire, an interesting interior, and some good detail, for the most part of the twelfth and thirteenth centuries. Not the least interesting part of what Mr. HAIG was able to examine was, he says, the doorway illustrated, but doubtless the interior contains much that might have been even worthier of notice. The fact of the church having been transformed into probably the most sumptuous hay-barn in Dijon, and its being completely filled with that useful article, obliged him to be content with the doorway, which is much decayed, but perhaps on that account a tempting subject for the pencil. The street is almost deserted except by children from the neighbouring school, but these, the sketchers' friends and occasional mischief-makers, find in the sculptures fewer noses to knock off than in some other places, for the carving consists of pure conventional foliage with only the much-decayed figures of two angels in one of the capitals. The noses of these poor angels vanished long ago, and likewise the more delicate portions of the foliage, but enough remains to indicate the former excellence of the carving. Of the four shafts only the two of the eastern jamb remain, and the tympanum retains some faint traces of a painted Crucifixion. There is much in Dijon to employ the pencil, two or three of the churches and some secular buildings being very interesting; but many of the readers of this journal will probably, on examination, find that among the objects for which the town is famous, the much-praised monuments of PHILIPPE LE HARDI and his son, in the ancient palace of the Dukes of BURGUNDY, are somewhat overrated.

THE CHURCH OF ST. ETIENNE LE VIEUX, CAEN.

SITUATED fairly open to the view at the north-east corner of the chestnut-shaded "parc," St. Etienne le Vieux is seen to some advantage; but many will probably be sorry to find it so little taken care of by the town. The church is certainly a fine and interesting example of the Gothic of the fifteenth century, with some early Renaissance of the sixteenth, and might deserve a better fate than to have most of its windows either built up or else the glass smashed and the interior converted into a store for lumber of the most mixed and often ludicrous description. Of course, this desecration is better than the complete destruction to which the church was doomed in 1850, and from which it was fortunately saved by the Society of Antiquaries of Normandy. But the want of veneration shown in Caen, as well as in other French towns, for old ecclesiastical edifices of merit is deplorably exemplified in this church, which possesses both in mass and detail much that is highly suggestive. Of the earlier church that stood here little is left but the name, although the careful observer will discover here and there in fragments of sculpture—such as, for instance, the knight on horseback built in at the east gable, and some details of doors and windows, &c.—relics of a much older structure. The church has experienced curious vicissitudes, one of which is its having been exposed to the gunnery of the English in the early days of artillery warfare, as witness the numerous holes and fractures caused by the balls. In fact, there can be no doubt that the hand of man is chiefly responsible for the damage sustained by this interesting monument, but the reproach is merited less by foreign enemies than by the French themselves.

QUANTITY SURVEYORS' ASSOCIATION.

THE first annual dinner of this Association was held on Thursday evening in last week, at the Freemasons' Tavern, Great Queen Street; Mr. Walter Lawrance, F.S.I., president, was chairman.

The following gentlemen were among those present:—Messrs. A. J. Gate, F.S.I., vice-president, W. Hoffman Wood, vice-president, E. Guy Dawber, W. E. Riley, A. A. Hudson, F. B. Wade, L. Maton, A. Ritchie, J.P., C. H. Barnsley, president of the Institute of Builders, F. Higgs, president of the London Master Builders' Association, W. Hill, H. C. Smart, F. A. Powell, P. Lawrance, Aubrey Wade-Palmer, C. Franckeiss, S. P. Rees, Septimus Hill, J. Parsons, G. M. Swan, Rev. C. J. Hollis, Messrs. H. A. Heffer, J. M. Beveridge, J. Rose, A. W. S. Cross, F. Wallis, J. Aylott, W. W. Barber, H. P. Barber, J. Bartlett, C. W. Bowles, P. Bywaters, T. J. Carless, H. T. A. Chidgey, G. J. Clarke, A. G. Cross, H. C. W. Dodd, H. England, A. R. Evans, C. J. Ford, H. A. A. Gate, W. R. Hood, J. Jellis, C. A. Kennett, C. W. Latta, J. G. Mayhew, C. H. Mumby, E. D. Nixon, C. A. Ovitts, J. S. Parmenter, H. L. Pridmore, H. Raven, J. Rookwood, H. Smith, H. G. Tarrant, T. Thompson, H. J. West, T. F. Waggett, and F. B. Hollis, honorary secretary.

After the usual loyal toasts had been duly honoured, Mr. W. E. RILEY, architect to the London County Council, proposed "The Imperial Forces," to which Mr. A. WADE-PALMER briefly responded.

Mr. A. J. GATE proposed "The Quantity Surveyors' Association and its President." The toast, he said, had at least one charm, that of novelty, for it was the first occasion on which it had been proposed. Their worthy president would have the first attention in his speech, for he would not take so long to deal with as the Association. Their president was endeared to everybody by his geniality. He was also a skilful surveyor, upright and impartial in business, and in cases of litigation or dispute always just to the parties concerned. Turning to the objects of the Association, he said he wished to indicate what they were, because there had been a good deal of misconception in the matter. To do that in the best way he would begin by saying distinctly that the Association was not a rival to any other association or institution. He was compelled to say that because it was believed to be started in rivalry to another body. They had made a few enemies, but those enemies were for the most part confined to the black sheep of the profession, men whose business practices must be put down, and men who wished to join the Association but who were prevented from doing so because they were not qualified up to the extent the Council wished. It had been alleged that there was no need for the Association, but the speaker held that since the Surveyors' Institution had failed to fulfil its charter in the raising of the status of the quantity surveyors, there was need for a more active society to guard the interests of the profession. He went so far as to declare that it was impossible for the Surveyors' Institution under its present charter to remedy the difficulties which the Association proposed to deal with. He questioned how many men holding the letters F.S.I. after their names were competent to take out quantities, and suggested that nothing like 10 per cent. were in that position. There were many men who would go about canvassing for work in a manner that tradesmen ought to be ashamed of, and who begged for work at reduced fees. The Association proposed trying to put a stop to such practices, and to do it successfully they needed in their ranks the help of all respectable members of the profession. Members of this Association would become known as men competent to perform a quantity surveyor's duties. The Association could not guarantee that the members would do their work properly, but they could vouch for their competency, and their rules would enable the Council to remove from membership the names of those proved to be incompetent in practice. The Association was also desirous of fixing a minimum scale of charges for the work undertaken by quantity surveyors. The speaker next dealt with the duties of the quantity surveyor in relation to the builder, the building owner, his legal representative and the architect. His duty to the last named was the most difficult to fulfil, for he had to get behind the mind of the architect and ascertain what he wanted, and, added the speaker humorously, this was a difficult matter sometimes, because the architect often did not know that himself.

The PRESIDENT, in responding, thanked Mr. Gate for the kind words he had uttered and for the able manner in which he had set forth the objects of the Association. He,

as their president, had set his heart on attaining the end for which it was formed. The start was not made without trouble and difficulty, and as they had succeeded in getting incorporated, it remained for the members as a body to handle the ropes smartly and keep the ship moving. He appealed to the general body not to sit still and wait for the reform to come to them. In trying to attain the objects of the Association there was no doubt members would have to exercise a little unselfishness, and perhaps at times some self-sacrifice would be needed, especially in remaining loyal to their brethren by not accepting work below the minimum charge set forth by the Association. If quantity surveying was to continue on the basis of an honourable profession, and a living to be made out of it, they could not countenance the reduction of fees to the rates at which some men were offering to do quantity surveyors' work. The high standard of work could not be maintained with greatly reduced fees. They knew thoroughly well that work accepted at ridiculously low fees could only be produced by untrained, inexperienced and underpaid assistants. They must, therefore, do what they could to impress upon public bodies and committees that the preparation of quantities required skilled and experienced assistants, and below a certain minimum charge the work could not be done properly. All architects of experience knew the value of good work by the quantity surveyor, and appreciated the assistance which his care was to them in pointing out difficulties in details of construction which could not be noticed in the preparation of the drawings, and the anxiety and friction saved with the contractor during the carrying out of the work. As to contractors, there was nobody who appreciated more the value of really good bills of quantities than the experienced estimators, and it was a pity contractors could not return some of the rubbish which they received as quantities. The well-prepared bill of quantities was in the end the greater economy, and it enabled the estimator to calculate his prices to a nicety, thus giving satisfaction to the architects and their clients. Then there was the appointing of surveyors as arbitrators in disputes, more especially of measurements and quantities. The President said he was sure that in the majority of disputes in building cases the quantity surveyor was more competent to act in the capacity of arbitrator than the architect. It was also suggested that a universal mode of measurement was desirable. London quantities were accepted almost all over the country, and they might form a basis on the London practice. Continuing, he said it was a matter of congratulation to have such a representative gathering at the first dinner of the Association. In asking the secretary to state a few facts with regard to the Association, he expressed gratitude for the time and attention Mr. Hollis had given in its formation. In conclusion, he thanked the members for the honour they had done him in electing him their first president.

Mr. F. B. HOLLIS, in reply, said they had upwards of 300 applications for membership, out of which 130 had been elected. The first examination was to be held in May next, and they had already received 130 applications for papers. He believed the Association was doing good work, and suggested that at no distant time men practising outside its membership would not be recognised as quantity surveyors.

Mr. W. HOFFMAN WOOD, in submitting the next toast, "The Architects," said no one knew better than the quantity surveyors the ability that was required of architects for their work. Among the difficulties they encountered were the local by-laws and the whims and fancies of their clients, and yet their plans of buildings were so well conceived that, as the works neared completion, every detail and item fitted a place that would seem to have been specially arranged for it. He wondered why architecture should be missed out of the most learned professions, for to be proficient required as much of a man as law, physics and divinity.

Mr. E. GUY DAWBER, who responded to the toast, said it was really refreshing to hear a word of praise given to architects—as a rule people only said hard things about the profession. It gave him great pleasure, he said, to take that opportunity of expressing to the quantity surveyors the thanks and gratitude that architects, as a profession, owed to them for the assistance that was always so readily given. He assured them that architects did truly realise the value of that assistance, as they knew their buildings could not be carried out successfully without it. They did hear of architects in the North of England taking out their own quantities, but the speaker thought such a practice placed the architect in a wrong position, because then it was

doubtful if he could take an impartial view of the quantities. He congratulated the Association, and hoped it would flourish for many long years. They had heard that evening about the black sheep among the quantity surveyors, but he must say that it had been his privilege only to meet with strictly honourable and upright men in the profession, and he wished to regard it as composed only of men of that character.

Mr. W. R. HOOD proposed the toast of "The Contractors," and in a short speech suggested that it would be well if quantity surveyors spent part of their pupilage time on the staff of a first-class contractor, gaining thus an insight and experience that would be of material benefit when they practised their own profession. The Association should be supported by the contractors, because its object was to raise the status of the quantity surveyor and register him as competent to follow his profession.

Mr. C. H. BARNESLEY, replying, was proud to be a contractor, and was sure they agreed with him when he said that their craft was a very ancient one, and full of importance and responsibility. He regretted, however, that the old system of apprenticeship was dying out, more especially in the trades of bricklaying and plastering. The plasterers limited their apprenticeship to the sons and relatives of plasterers, so that if those youths were not desirous of continuing in that trade the difficulty contractors met with was apparent. It was hoped, therefore, the trades would see the folly of such rules, and allow others who were willing to serve an apprenticeship in the trade.

Mr. H. ENGLAND proposed "The Visitors," and this last toast was responded to by Mr. A. A. HUDSON and Mr. A. RITCHIE.

A musical programme was followed between the speeches, and contributed to the success of a very pleasant evening.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. E. GUY DAWBER, president, in the chair.

The following were elected as members:—Messrs. R. W. BURROWS, W. BONSER, F. C. B. DABBS, J. A. BESSANT, H. BERTON-BENJAMIN and R. F. ATKINSON.

Mr. F. J. OSBORNE SMITH read the following paper on

Country Houses and Accessory Buildings.

The invitation to prepare a paper upon this subject was accompanied by a suggestion that I should deal more particularly with the drainage of country houses and accessory buildings. Approaching the subject from the point of view of an architect anxious to produce healthy dwellings for men and animals, it will be necessary to refer somewhat in detail to items of work which are not usually discussed in the studio or the drawing office, but too often left to be dealt with, more or less effectively, in the clerk of works' office, or in the case of large buildings, by someone who has given special attention to them. My aim is to induce students to give more attention to what many will find to be a very interesting portion of their manifold duties. Architects should "design in beauty and build in truth," and there is no reason why the beauty of their design should be marred by truth taking the form of twisting pipes over the fronts and roofs of their buildings; careful arrangement in planning will obviate this by placing the sanitary fittings in such positions that their necessary pipes can be fixed practically out of view and yet be quite accessible in case of need. This is more easily effected in new buildings than in old ones, yet in the latter the unsightly lines referred to can usually be modified by judicious arrangement without in any way affecting the thoroughness and efficiency of the work. "Sanitation" or "hygiene"—the science of promoting health—has, under the conditions of our civilisation, the first claim for consideration when designing a healthy dwelling, and it is not prudent for architects to despise or neglect this important branch of knowledge. The limited portion of the subject which we are about to consider to-night will, I hope, promote an interesting discussion. The most suitable position our building is to occupy on the site; the nature of the soil, the quality of materials, positions and dimensions of rooms, windows, doors and fireplaces, and the material for roof, &c., all these affect the health of those who occupy the buildings, to say nothing of the drains, water supply and numerous fittings which are usually classed under the head of sanitation.

Sanitary engineers have such an idea of the importance of their pipes that they will place them in the most conspicuous positions possible, utterly regardless of the elevation they are spoiling, while inside one hundred and one minor items will be inappropriately arranged so as to clash with decorative or constructional features, to the annoyance and disgust of the architect.

Good plumbers are naturally proud of their work, and do not like to have it hidden away, but, if we make use of this pride on their part and take an interest in their work, they will make a very creditable show, which can be made to harmonise with the surroundings and be too good to be covered up. If the architect shows that he appreciates and takes an interest in their individual work, it will encourage good artificers to execute it with special care with the happiest results. This present craze for unduly hastening work along is responsible for much of the bad work frequently met with, which only disheartens the workers.

There is one other point I wish to call your attention to. Do not, as I am sorry to say many architects do, hand over drains and fittings to a merchant or manufacturer to carry out.

I propose now to refer to:—1. Water supply and fittings required for the effective working of the water-carriage system of drainage. 2. Soil and waste pipes. 3. Drainage for soil and rain-water. 4. Land drains. 5. Stables, cow-houses and dairies. 6. Disposal of sewage.

Water Supply, Cisterns, &c.

The source from which water is derived may be either from collecting ground on moors, hills, &c., or from artesian or deep wells, the latter being the most general. Great care must be exercised in selecting the wells which are to supply the drinking water. There are country towns where the water is supplied by a water company to many houses, while the remaining are still supplied by wells, and it is no rare occurrence to find the disused wells of the former turned into cesspools, with very serious results to wells of the latter; therefore, when later on we are considering our sewage problem, we must not forget the wells and that possible pollution may result unless great care be exercised in selecting a suitable site for the disposal of the sewage. The fall of the surface cannot always be taken as indicating the contour of the water-bearing strata. Having satisfied ourselves upon the purity and quantity of the water supply, our next consideration must be how to store it in a convenient manner for use free from risk of pollution. It may be stored in a reservoir or underground tank, which must be very carefully formed with sound brickwork upon a concrete bottom, and covered in by doming, arches or concrete and iron; the bottom should be formed with rounded angles to facilitate cleaning, and the whole of the inside surface rendered and smoothly trowelled in cement. There should also be clay puddling round the outside and over the top, while the opening for access must stand well above ground to prevent surface-water finding an entry. Frequently the situation will not allow of this form of main storage tank, when it may be necessary to build a water-tower and allow the water to supply the cisterns in the house, stables, laundry, &c., by gravitation, or otherwise pump direct to the storage cisterns in the buildings, which frequently means very heavy work for the pumps due to long horizontal pipes. Overflows, which should be as short as possible, must be provided to all tanks and cisterns, and not be connected to drains. Store cisterns inside the building may be of lead, galvanised iron or enamelled fireclay, and should always be provided with a movable cover and situated in a clean, accessible position.

Baths.

The bath-room should be large, light, and airy, with cross ventilation, and the walls and floors should be of impervious material, but if of wood it should be covered with lead. The fittings may include, beside the usual slipper bath, a single or double lavatory basin, a shower and spray bath, either combined with the slipper bath or independent. Other baths are sometimes used, such as a sitz bath, bidet, &c., but the combined slipper and spray meets most requirements. Perhaps the nearest attempt to an ideal bath is the latest pattern independent copper bath, which is made of strong copper with roll edge and strong supports or feet; the outlet is at the end, where it should be, and not in the centre, as is usual in copper baths, and has large pillar cocks and standing accessible overflow, quick waste and trap. At the end is a plate-glass screen on three sides, behind which are the various plated pipes

or shower, spray, wave, douche, &c. The next best is a first quality white enamelled cast-iron bath, with roll edge, quick, accessible waste and overflow combined, without casing, the outside being decorated in harmony with the room. Glazed fireclay is perhaps the most durable and sanitary material for baths, but, owing to its great thickness, a bath of this material is very heavy, and requires to be warmed with hot water when not in constant use. In public baths, where the demand for baths is constant, this kind is generally fixed. Some baths need an enclosure; these should be avoided, as the space within becomes a store for matter in the wrong place. It is most important that a bath should be fitted with a plentiful supply of hot water, large supply valves discharging above the water line of the bath, and also with a large, quick waste. The noise frequently experienced when the bath is emptying may be checked to a great extent by providing ventilation to the waste pipe, although this retards the velocity of the discharge. The lavatory basins may each be formed in one piece of pottery, or fixed beneath a marble top supported upon cantilevers, but without enclosures; the necessary pipes may be of plated brass or copper if desired, but, personally, I prefer lead, kept back of the way of injury.

While speaking of pipes, let me advocate the importance of fixing every pipe upon the surface of the walls, not buried in them, as is so often the case. Chases are sometimes advisable, but, if used, they should be regarded as recesses in the walls and be rendered in cement, or otherwise lined with impervious material to match the wall surfaces and covered with movable casing. The hot-water service pipes may be carried along one side of the room or to a radiator, in the form of a towel horse, which will be found very convenient. The linen cupboard might, with advantage, be formed somewhere near at hand, so that the hot-water pipes may, on their way to the bath, be used to keep the linen aired by passing through the cupboard.

Water-closets

These should not be in the bath-room, nor should access to them be from a bath-room, but from a ventilated lobby common to both. Neither is it advisable to have a lavatory basin in the water-closet. The walls and floors and ventilation described for bath-rooms equally apply here. Carpets ought never to be used, a loose mat being far preferable. The apparatus should be as simple as is consistent with efficiency. A pedestal closet should be of the wash-down type, not "wash out," in one piece of fireclay, or similar material, strong and neat in appearance, with accessible joints to soil pipe, and no recesses in which dirt may accumulate; the flush pipe from the cistern should discharge vertically into a socket provided at the back, without indiarubber cover, and, with two gallons of water, should thoroughly wash the inside of the pan and replace the whole of the contents of the trap with clean water. The larger the water area, the less liable is the pan to become foul, but beyond a certain point the contents cannot be efficiently removed except by syphonic action, as in the syphonic closet. There are various forms of type of closet, some better than others. Those without air pipes and puff pipes in the cisterns, but having a second trap, are to be preferred; the simpler the apparatus the better.

Various means for discharging flushing cisterns for wash-down closets have been devised. Besides the simple pull, there is the push valve, to release confined air and allow the syphon action to start, or to compress air and thus drive the water over the syphon to start it; there is also the plunger, the lifting valve, lifting drum, &c. The lifting valve to start the syphon is the simplest and generally most certain in action, and is passed by most water companies. The flushing cistern may be of cast iron, but should be galvanised to prevent rust; lead-lined or cast-lead cisterns are best when the water does not affect the lead, but are more costly. Porcelain is also a useful and ornamental material. The flush pipe of lead or copper should be as straight as possible, and securely connected to the arm of the pan. Indiarubber covers are not desirable for this joint. Valve closets are not so frequently used as formerly, owing to their complicated parts and liability to leaks, although they are sometimes preferred for ladies' use. They should be fixed within an enclosure which is easily accessible, floor lined with lead, and the walls and all inside the enclosure painted white. There should be a large supply valve, accessible overflow and a puff pipe to the open air from the valve box between the valve and the trap beneath. Slop tops, formed in one

piece with the pan, assist in making a draught-proof seat. Valve closets require a separate supply cistern containing about ten gallons. Overflow pipes from cisterns and floors should not have flaps on their external end as is so often advocated; they invariably become set fast, either open or shut, and are then useless. These and other small flushing cisterns can be cased or otherwise decorated to harmonise with the surroundings, and the pipes to and from them cased.

Urinals.

In a private house "avoid them entirely"; at best they are a constant nuisance and need every care and attention, with abundant flushing; even where necessary, as in clubs, factories, schools, &c., they should be as simple as possible, with waste and water pipes easily accessible. The outlet usually supplied with them is almost useless. I refer to those formed in one piece of fireclay. Never fix urinals on upper floors, as, unless careful attention is given to the fixing and the waste from them, they invariably leak and cause trouble below. The weak points are naturally the joints, therefore the fewer the better, the one joint to which particular attention should be given being the one between the urinal and the trap, which should always be formed with a large brass washer, fly-nut and union, having a dome grating with bayonet joint.

Housemaid's Sink, &c.

There should always be a small room with opening window on each bedroom floor fitted with a slop sink, which should be fitted as a water-closet, with flushing cistern, &c., connected to soil pipe, and also a sink for drawing hot and cold water. The waste from the latter should discharge into an iron (not lead) waste pipe. The combination of these two sinks in one set, so common in makers' catalogues and exhibitions, is often unsuitable for the intended purpose, because the hot and sometimes boiling water produces injurious expansion in the soil pipe with disastrous results. The space under these sinks should be kept free from enclosures and every facility given to minimise the difficulty of keeping these places clean. Above all things linoleum should never be fixed under sinks, one so frequently finds it there with always the same result—moisture and decay. The main water cistern should never be placed in this room, although, I regret to say, it is not an unusual position to find it in.

Kitchen and Scullery, Sinks, &c.

This department should have preferably a north aspect, lofty, well-lighted by windows reaching to near the ceiling. The walls and floors should be of impervious material, which may be readily cleaned. The sinks should consist of one or more for washing purposes, and may be of enamelled fireclay, with wire or teak grid-tinned copper or lead-lined wood sinks, each having their respective merits and defects. Fireclay sinks are cleaner than the others, but are easily damaged by saucepans, and are liable to break the crockery unless the grids are used. Copper and white-metal sinks are perhaps the best, but are expensive. While lead-lined are very general, they are dirty, and frequently need repair, but are less destructive to crockery. Vegetable sinks should also be provided for washing vegetables, and are best of the deep enamelled fireclay kind, fitted with plug, grating and overflow, being much more easily cleaned than others. All sinks should be supported upon cantilevers, and the spaces under should not be enclosed, although a guard rail will be necessary to protect the pipes and traps from injury. Teak sinks are sometimes used for washing-up purposes, but they need constant cleaning to remove grease, &c. Outlets from sinks should always be formed with large cobweb gratings. The trap below should be connected to the sink by a strong brass union, back-nut and lead washer, instead of the spigot and socket with stoneware pipe so frequently met with in the cheaper class of sink.

Larders

should have a northern aspect, with abundant cross ventilation and be near the kitchen, but not entered direct from it. Wire gauze (preferably of copper) should be fitted to the windows and secured to wood frames on hinges. Some larders are fitted with pickling troughs, with plug and waste; these, of course, must not be connected to a drain, neither should a gully be in the floor. If drainage from the floor is necessary it should be formed by connecting the floor to an outlet through the wall as short as possible and discharging upon the surface of the paving outside. Shelves should be of slate, supported upon cantilevers, the walls lined with

white glaze bricks or tiles and the floor of some impervious material. Personally, I prefer a slate table in the centre of the room, leaving the walls free. Larders should not be formed underground.

Pantry and Still-room.

The butler's and footmen's pantries and the still-room require sinks, which may be either of enamelled fireclay or lead lined; some butlers prefer the former, others the latter. These sinks are usually supplied with draining boards, preferably of beech, if not covered with lead. The space under the sinks is usually enclosed; when this is done the walls and wooden sides should be painted with white enamel and a lead safe formed on the floor, turned up all round at least 6 inches, having a 1-inch waste pipe discharging through the wall to the open air. This cupboard is generally used for a pail to receive pieces, tea-leaves, &c., and soon becomes in an insanitary condition if precautions be not taken to insure cleanliness. Enclosures under or around any sanitary fitting invariably become nuisances, and it is preferable, except in special instances, to omit them and everything that hinders the regular cleaning of the recesses. All these sinks should have drinking water laid on from the main supply pipe and labelled "Drinking water."

Having considered so far how clean water can be obtained and utilised inside a dwelling, I now propose to indicate how foul liquids can be got rid of.

Soil Pipes.

When considering soil pipes we must determine:—

- (1) The material of which it is to be made; (2) the size necessary under the conditions; (3) the position in which to fix it; (4) the surroundings such as rain-water pipes, &c., with which it should harmonise; and (5) method of fixing and jointing the pipe.

Soil pipes are usually made of cast iron or drawn lead—cast iron made in 6-foot lengths, either coated with Dr. Angus Smith's solution or galvanised; the latter is most suitable when the pipes are to be painted to match the rain-water pipes, because paint will not remain upon Dr. Angus Smith's solution. These pipes are cheaper than lead, less liable to damage, and more easily fixed and jointed, but they are more unsightly, and there is difficulty in obtaining a branch to suit exactly the position, and many branches mean many joints and much cutting of pipe. A cast-iron junction usually means at least three joints, while in lead pipe only one is necessary. Drawn lead soil pipe is made of thicknesses corresponding with those of sheet lead. The pipe whose thickness is equal to that of 8-lb. sheet lead is the strength most generally used, or for special purposes 10 lb. The inside surface of lead pipe is smooth, and, provided that the size is suitably small for the work, it will remain clean and free from corrosion. Rarely will it be necessary to exceed $3\frac{1}{2}$ inches internal diameter for any soil pipe, especially in country houses. Lofty buildings in towns may require 4 inches, while larger sizes are occasionally met with. I might mention that these larger pipes are almost invariably furred to a considerable thickness on the inside after being in use a long time, thereby reducing their internal diameter. I know of one case where the working diameter of a 4-inch pipe was thus reduced to $2\frac{1}{2}$ inches. A ventilating pipe is quite a different matter, 4 inches to 6 inches diameter may be often more suitable than $3\frac{1}{2}$ inches. If it be necessary to fix the soil pipe within a building, it should be of 8 lb. drawn lead at least, but must not be buried in the wall, and if in a chase, the walls should be treated as previously described for water pipes, and the casing in short lengths should be secured with brass cups and screws to framed grounds fixed to the walls. The most suitable place to fix a soil pipe is outside the building, in which case it should be arranged in such a manner as to be as unobtrusive as possible. The method usually adopted of fixing soil pipes in 10-foot lengths with three pairs of double cast-lead tacks is certainly efficient, but at the same time it is not elegant. Sometimes astragal joints or socket joints are used instead of the usual wiped joint, with disastrous results, there being insufficient solder to form a lasting connection, more especially if it be fixed with sheet-lead tacks fixed 6 feet apart. How can this be remedied? One way I have found very successful is to have strong pipe in, say, 6-foot lengths, to agree with the rain-water pipes, which may also be of lead, and fixed to walls with extra strong lead strips wiped on to the pipe at the joint and covered with ordinary sheet-lead ears, the joints being "wiped" in the usual way, with a small astragal attached to the pipe above and below the joint. By this means the pipe is securely jointed and fixed, and except to

the initiated, is similar in appearance to the rain-water pipes. We are told that an "anti-syphonage pipe" is necessary to preserve the seal of the closest trap. Quite so, but in the majority of country houses anti-syphonage pipes are not necessary, there being only two principal floors as a rule. Perhaps in one or two instances it might be necessary, but need not occur upon the principal elevations in a carefully planned building. Soil pipes now invariably discharge direct into the drain, and the upper part is continued to above the roof of the same to great diameter, with a simple open end protected by a stout copper-wire balloon. Cowls have been proved by experiment and practice to have few, if any, advantages over open ends, as these pipes frequently act as inlets as well as outlets. The less obstruction there is to check the current of air in either direction the better. Boiling water must be carefully excluded from lead soil pipes, otherwise the undue expansion will split or tear apart the lead at the junctions between the branches and the main pipe.

Waste Pipes

from baths, lavatories, sinks, &c., not being slop sinks should always discharge into gullies in the open air beneath the grating, but above the water. This is a very important point, as many by-laws require them to discharge into a channel 2 feet from the gully. A more objectionable arrangement it is difficult to imagine, and I hope before long to see the provincial authorities follow the example of the L.C.C. and eliminate this undesirable by-law. These waste pipes must be, if more than a few feet in length, of some material which is not easily damaged by hot water. Wrought iron with screwed joint or cast iron with caulked joints are most generally in use, although the short lengths referred to previously and short branches may be, and in fact are, preferably of lead. The expansion of iron pipe, if connected directly to a lavatory basin, &c., is very likely to damage the fitting. Lead pipes have, I might almost say, an ideal internal surface for conducting water and sewage from point to point, offering the minimum of resistance. They are, however, injuriously affected by various means—for instance, damage by violence, such as knocks, nails, bradawls, &c., when behind panelling or casings, &c.; chemical action when buried in walls producing decomposition; "creeping" buckling, and, finally, cracking or tearing when subject to great variation of temperature. The facility of bending lead pipes of small diameter is so great that its use is often preferred for this quality alone, which enables the pipe to be fitted with greater ease to the angles and curves. Wrought-iron pipes are expensive and more liable to rust than cast-iron, which is cheaper and stronger and allows a little play at the joints. The joints will probably in course of time need recaulking if the stack is very long and has very hot water frequently passing through it. There is another type of pipe which is referred to in one of the latest books upon this subject as the best for all purposes, viz. cast-iron pipe lined with lead. What better would be desired?—a strong exterior, with a smooth interior, of lengths corresponding with rain-water pipes, and the joints more easily made and fixed than in the case of lead pipes. Let us for a moment consider the condition of this ideal pipe after it has been in use as a waste pipe for a short period. Hot water has been frequently passing, and the lead lining has, in the same way as lead pipe, been expanding more than the iron outside, and consequently the two materials have become separated; the hot water still continues to flow intermittently through the pipe, the lead "creeps," and cannot bulge outwards because of the iron coating, therefore it is forced inwards, with the result that the pipe is practically choked. I will leave you to form your own opinion upon this ideal pipe.

Waste pipes generally may be considered similar to soil pipes as regards fixing, &c., but they must, as I said before, discharge into a gully near the foot, which in certain positions should have an air-tight cover and be ventilated at a convenient position away from windows, &c. The upper part should be carried above eaves and windows, and the traps of each fitting should be protected by a puff pipe, which is brought under the basin top to the face of wall outside. This puff pipe does double duty: besides protecting the trap under the fitting, it acts as an overflow in case the vertical pipe without heads is temporarily blocked, and thus saves a flood in the room below if a bath, for example, is discharged on an upper floor. I always prefer waste pipes with junctions instead of the various branches discharging into heads at each floor. The heads offer a large exposed surface for the accumulation of filth. The traps

should be of strong anti-D cast-lead type, with screw cap for cleaning, and a short length of lead connected to the iron pipe with brass tailpiece and caulked joint outside. Traps from lavatory basins should be $1\frac{1}{4}$ inch diameter, while those from the bath and sinks, except scullery sink, should be 2 inches diameter, and the scullery sink $3\frac{1}{2}$ inches to 2 inches—that is, $3\frac{1}{2}$ inches at inlet, to receive a large cobweb grating.

Drains, Gullies, Chambers, &c.

The term "drains" is generally understood to refer to the pipes underground conveying the sewage from the soil pipes and gullies to the sewer, cesspool or filter bed. These are formed of two different materials—heavy cast iron, protected by a coating of Dr. Angus Smith's solution, and glazed stoneware. The choice of these two is generally determined by the nature of the ground and surroundings and the relative positions of the house and drain. On a bad foundation, when passing under a building, or if the drains be near the surface, iron pipes, possessing greater strength and having fewer joints, are less liable to damage, but the inside is not so smooth, nor does it resist acids to the same extent that glazed stoneware does. A well-laid stoneware drain with clear bore bedded upon and protected by good cement concrete with carefully made cement joints is much more self-cleansing than an iron drain. The cost of drainage is practically the same whichever kind of pipe is used, less concrete being required for the iron pipes. Fall or inclination is an important factor in considering drains—1 in 30 (or 4 inches in 10 feet) is most suitable for a 4-inch drain, and 1 in 40 (or 3 inches in 10 feet) best for a 6-inch drain. We are not always able to obtain these falls, but they should be adhered to as closely as possible. Excess of fall is quite as unsatisfactory as too little.

Gullies.—All gullies should be bedded in cement concrete, fixed as near the surface of the ground as possible, and covered with a $3\frac{1}{2}$ -inch dished York stone to receive grating. When it is necessary to keep the gully low down a chamber 12 inches square, inside dimension, should be formed of 9-inch brickwork in cement, smoothly rendered and brought up to receive the dished cover stone at surface of ground. It is essential that these extensions, and, in fact, the whole system, should be watertight. Deep chambers over gullies are not desirable. Circular gullies (and square ones by the use of an adapter) are sometimes brought to the surface with 9-inch diameter stoneware pipes, in which case the pipes should be surrounded with concrete. It is advisable to have all ironwork, except iron drain-pipes, &c., galvanised to protect them from rust. It is sometimes held that the galvanising soon perishes; I must say I have not experienced any inconvenience in this respect, while constant trouble exists where iron is not galvanised. A flush tank, when connected to the scullery gully, is very useful for breaking up and driving the grease through long drains. Sometimes the bath waste is arranged to effect this object. Sand used for cleaning copper utensils is a great trouble in drains, for when mixed with the grease it becomes very hard and solid. The only remedy is prompt and frequent removal of grease, &c., by flushing with pails of hot soda-water or sweeping the drains, in addition to the flushing just mentioned. The gullies should be of the self-cleaning, deep-seal type, with 10-inch grating. Those used for surface drainage only should be made deep to retain the grit, &c. When a waste-pipe discharges some little distance from a gully it is often advisable to fix an access shoe at the foot and carry the drain to inlet of gully underground. This shoe should have a stone cover similar to those used for gullies, and galvanised iron plate let in instead of the grating to keep out leaves, stones, &c. So-called grease traps are ineffective as well as very offensive and dangerous contrivances.

Chambers—or manholes as they are frequently called—should be placed at intervals in the drainage system, at bends, junctions and at points of disconnection, also in straight runs of considerable length, at least over 60 feet, to facilitate sweeping, &c. The chambers should be formed upon a 6-inch bed of concrete with 9-inch brick walls, smoothly rendered inside to underside of cover, the bottoms formed of white glazed channel with three-quarter channel branches, and brick on edge placed vertically along the main channel and benched up to an angle of 30 degrees, to offer as little facility for lodgment in event of a temporary stoppage, and also to give a secure foothold which a steeper angle does not give. The portion not enclosed by the iron cover should have 3-inch York stone firmly bedded in cement. The size of these chambers depends upon their

depth. A shallow chamber—that is, up to 2 feet 6 inches deep—should be as nearly the size of the iron cover as is consistent with the number of branches it receives, while deeper ones should be about 2 feet 6 inches wide and at least 3 feet long to give a man room to work in them. It is obviously unnecessary to form chambers larger than required for the work they have to do, because in case of a stoppage they take a longer time to fill, and thus make their condition apparent. You will notice that I have not advocated iron chambers even when iron drains are used. I think it will be a long time before we are able to find anything better than the chamber of rendered brickwork and white glazed stoneware channels. Iron chambers are simply inspection bends or junctions; it is difficult to make the covers watertight, and they are difficult to open, especially when it is necessary to move an obstruction. They are sometimes useful inside a building at the top end of a branch where the drain is shallow. These iron chambers still require the brick chamber, which should be rendered, and iron cover for access, so that there is little or no advantage in using them.

Chamber covers are of various types; those with a condensation seal are undoubtedly the best, especially when inside a building. There are also covers formed to receive tiles, wood blocks and turf on gravel, which are less conspicuous than the chequered iron tops, only a rim of iron being visible. If necessary, any cover can be fixed just below paving level, the stone slabs bedded in sand effectively obscuring it from view. Locking covers, except in certain exposed positions, are not necessary. Let each cover have eyelets for hooks, instead of hand holes, and be strong and heavy. They will then be difficult enough for mischievous persons to open. Locks and bolts only become corroded, rusty or broken, and are then useless, and cause considerable waste of time when examining or testing. Hinged covers are always a trouble, and are going out of use. Ventilation of the system must not be forgotten. Soil pipes usually provide the necessary outlets, but they are not sufficient alone in all cases. The idea that two or more pipes taken from different branches to above the roof will secure efficient ventilation is erroneous. I will give you an example of this. A chamber was formed with five distinct branches, each with a V.P. taken above the roof. Surely this was sufficient ventilation. Yet upon raising the cover after the drains had been used a few months, the air in the chamber was found most offensive. After consideration, I decided to form an inlet of ground level some little distance away, with the result that the chamber is now as wholesome as could be desired. At the same time, I do not like the inlet in the front area just outside the kitchen window, as is so frequently the case in towns; but in country houses there should be no difficulty in keeping the inlet at a reasonable distance from the buildings. I call these "inlets," but, at certain times, they undoubtedly act as "outlets."

Rain-water Drains.

When the rain-water drain is treated separately from the soil drainage there should not be gullies at the feet of rain-water pipes, but instead stoneware or iron access shoes, with cover stone and plate to prevent surface-water or other undesirable matter finding its way to the rain-water storage tanks. Otherwise the drains should be constructed similar to soil drains. They are usually 6 inches diameter, with 4-inch branches to a single down pipe.

Rain-water Storage, &c.

Rain-water, especially when gathered in the country, is fairly clean, and if filtered and stored in suitable receptacles is a great acquisition, more particularly for washing purposes. It is best, whenever possible, to collect and store the rain-water as near the roof as practicable, thus saving expensive pumping machines and underground drains and tanks. Needless to say, a large overflow is essential to prevent flooding in time of heavy storms. Cisterns for storing rain-water above ground should be of galvanised wrought-iron or lead lined, with covers in sections made to lift off. These cisterns should be placed in easily accessible and well-lighted positions. When stored underground the tank or reservoir should be similar to that previously described when considering water-supply and storage, with the addition of a filtering chamber.

Purifying Rain-water.

There are two means generally adopted for removing many of the impurities, such as soot and roof washings, from rain-water. The separator, which allows the first portion of the water to run to waste and then, by a rocking motion,

passes the remainder to the storage tanks is effective, but of course there is waste of water, which in a dry season is a consideration; while a filter composed of broken bricks, ballast and sand is most useful, but needs occasional cleaning. Some favour a small settling chamber, divided from the filter by a brick wall built with half a dozen courses, dry at the bottom, giving upward filtration, thus avoiding to a great extent choking of the upper surface of the filter, as in the case of downward filtration. All the tanks must have an overflow, but this should not be connected to the soil drains. Some years ago, at a building which I now visit periodically, an underground rain-water tank had its overflow connected to the soil drains; during a temporary stoppage in the latter sewage entered the tank through the overflow and was pumped up to the laundry. The overflow was diverted to a suitable position without any difficulty, and such a disaster cannot occur again. For obvious reasons surface-water gullies and gullies at the feet of rain-water pipes should never be connected to these tanks; yet I have seen soap-suds floating on the surface of the water in the rain-water tanks, probably from foul water from a lavatory being discharged into a gully at the foot of a rain-water pipe.

Land Drains.

When the subsoil of the site is surcharged with water it is advisable to conduct it away from the building as much as possible; this is accomplished by means of agricultural drain pipes laid without joints a short distance apart in trenches, and covered with ballast or brushwood to within a foot or so of the surface, and covered with ordinary garden soil or mould. If there be a flow to underground water, and we are able by land drains to divert it from the site of the building, nothing more need trouble us except to see that the drains do not in course of time become blocked with roots, &c. The water is not always so easily disposed of. At best we may only be able to lower the level of the water, in which case we must maintain a free exit for the surplus and remove it as quickly as it accumulates, either by pumping or by discharging into a stream, ditch, or drain; in the last case, it will be necessary to take precautions to prevent a back flow in case of flood or temporary stoppage of the drain. A hinged flap is most frequently used, which closes upon a prepared seating and is fixed to the end of the discharge pipe; or a trap or gully in which a copper or rubber floating ball is placed, which, when water backs up into the outlet, effectively closes the inlet, thereby preventing the flood water finding its way into the land drains. It is convenient to form chambers of brickwork in cement at intervals upon the land drains, to give access and ready means of inspection to see that they are working satisfactorily. Rain-water or subsoil-water should be excluded from soil drains if the sewage is to be treated either by chemical or bacterial processes, otherwise unnecessary expense will be incurred by the increased volume to be dealt with.

Stables.

The floors of stables should be of hard, impervious material, with as few joints as possible, and currented to fall to a channel just outside the stall divisions, which discharges either through the wall into a gully or into an open end in the channel and thence to a gully outside. This open end is a small pit formed with a white glazed channel bottom and cement sides, the pit is made large enough to receive a galvanised cast-iron perforated bucket to catch straw, &c., and is covered with a heavy hinged cast-iron grating. It is often desirable, however, to provide a shallow channel with a cast-iron cover, let in flush with the paving, and with similar branches to the centre of most of the stalls, to prevent the straw becoming wet. Loose boxes usually have the open end before described in the centre continued to the gully outside. Every channel and drain in a stable must be easily accessible for cleansing and sweeping, and there should be no gullies inside the buildings. The manure pit should have hard, impervious walls and floor, the latter currented to an outlet pipe discharging through the wall into a gully. These gullies should be self-cleansing, but must contain a galvanised perforated bucket to catch straw, &c. Besides stalls and loose boxes for carriage-horses, hunters and cart-horses, there is usually a sick box. This should be quite apart from the others and have a separate drain from it. The washing space should have a deep yard gully to retain the grit from washings, &c. If there be a shoeing forge, as is sometimes the case, do not forget to provide a drain from where the horses stand. Drains from stables, cowyards, piggeries, &c., should always drain into a liquid manure tank carefully built in

brickwork in cement and rendered watertight, having a rounded bottom to facilitate removal of sediment. There should be a pipe from ground level to about 1 foot 6 inches from the bottom, into which can be dropped the suction pipe of a pump attached to a manure cart. The liquid manure can then be carted to the fields or gardens where required. These underground storage tanks should also be provided with an access hole in their crown and an overflow to carry off any excess which may accumulate in time of storm from surface-water gullies, &c., and may be connected to the main drain from the house to the filter-beds, &c. An ample supply of water is important for the stables, but it should be distinct from the house supply. A cistern in the loft or clock tower, to which the men can pump water, is a great convenience, and a hose can then be used for washing horses and carriages. One or two sinks are necessary in the harness-room or in a small room adjoining, with hot and cold water laid on to them. If a suitable grate with a boiler be fitted in the harness or mess-room, an ample supply of hot water can be provided for these sinks, which will be found very useful for various purposes. While speaking of hot water, I might remind you that the coach-house should be kept dry and at an even temperature. This is best arranged for by providing small hot-water apparatus with pipes in the coach-house, and, if possible, continued round the men's rooms. Sometimes a loose box is fitted up as a Turkish bath for the horses. This can be heated by the same apparatus.

Cowhouses.

Each division in a cowhouse accommodates two cows, and a wide trough is formed just outside the heel post. This channel and the dunging passage should be formed of an impervious material with grooves to prevent the cows slipping, and in the centre of each division should be an open end similar to those in the stables and conducted to a gully outside. The space where the cows stand should be level and formed of well-rammed chalk or clay. Calving boxes are treated like loose boxes, with an open end in centre discharging into a gully outside. Calf-pens usually have an open channel discharging over a gully. Pigsties should discharge through a pipe into a wide channel outside the sties, and be conducted to a gully with a basket before entering the drain.

Dairies

should be in a cool, sheltered position within easy distance of the cowsheds, and well ventilated. Near at hand should be the dairy scullery with sink, hot and cold water laid on, and paved floor currented to a pipe through the wall, discharging on to a gully not inside the building, as is frequently the case.

Disposal of Sewage.

The sewage when it arrives from the house and buildings may be treated in various ways, but time will not permit of a description of them all; they would provide sufficient material for a whole evening's discussion. One very simple and effective method which has proved quite satisfactory in dealing with this class of sewage may, however, be briefly described.

The sewage from a large country house with stabling for forty horses and accommodation for twenty cows, after leaving the disconnecting chamber, is first retained in a large water-tight settling tank, covered over similar to the old-fashioned cesspool, except that the inlet and overflow are turned down, thereby, among other reasons, preventing the scum finding its way into the drains. This tank is capable of holding at least one day's flow of sewage. The overflow is discharged upon the surface of a long, open-air filter situated in a meadow and composed of broken bricks, clinker, &c., finished with smaller local material on top. The sewage is distributed over the surface of the open-air filter by channels or a sprayer, and allowed to percolate through 4 feet to 5 feet of material, when it reaches a layer of land drain pipes at the bottom, which conduct the effluent to the end of the filter and thence to the land or ditch. The effluent is colourless and odourless.

The water in the ditch which receives it was foul and a nuisance before the introduction of this form of filter, but when I last saw it, after the filter had been in use about three years, it was quite sweet and wholesome.

Mr. ARNOLD MITCHELL, in proposing a vote of thanks to Mr. Smith, said they all felt that it was most difficult to write a paper which would be of practical use to architects. Mr. Smith had been successful in his effort, for the paper was practicable and full of hints that would help them in their work. He could not help thinking, however, that the

buildings referred to in the paper belonged to a class that many architects hoped to build, though few were ever given the opportunity. In a measure Mr. Smith had been talking a little above their heads, for notwithstanding the wrinkles and hints as to planning and draining, the tone of the paper showed a luxury in building which would not be allowed by many clients. Architects had to accept facts as they found them, for they had little or no choice in the arrangement of certain details. It was remarked in the paper that they should endeavour to conceal their external drain pipes. Architects knew this, but the difficulty was how to do it and build within the requirements imposed by local authorities. He supposed, therefore, Mr. Smith meant that they should go as far as they could to conceal external pipes. Then with regard to baths. It was suggested that the ideal bath was a copper one. The speaker agreed with this, but it was more expensive than porcelain. The value of copper baths consisted in the extreme thinness of the metal that could be used and the economy of the bath when used for hot water. The material, however, was so thin that the bath would not stand hard usage, and it was necessary to have it cased. The hot towel-rail was a good suggestion. A very economical way of introducing it was to run the hot-water pipes round two sides of the bath, bringing them out some inches from the walls.

Mr. S. Flint Clarkson, who seconded the vote of thanks, said that to his personal knowledge Mr. Smith had not merely a tepid regard for gulleys and wiped joints, but an ardent love for them. His paper might have been more aptly entitled, "Notes as to the Sanitation of Country Houses and accessory Buildings," but apparently both the larger title and the limited scope of the paper were suggested when Mr. Smith was invited to prepare it. Perhaps he would deal at a future time with the branches of the subject indicated, but not treated in detail. Mr. Clarkson then made suggestions as to the provision of sanitary blocks in large houses reached by cross-ventilated (but warmed) lobbies, containing cistern chambers at top, water-closets, some bath-rooms, lavatories, &c., below. If in a generally accepted position on the north side of the building and near the principal staircase they would be readily found when looked for, and awkward windows, suggestive pipes and ventilators on the garden fronts of pleasant buildings would be avoided. In a well-arranged water-closet the seat should not be under the window, but against a piece of the unoccupied wall, draughts and trouble in water supply being thus avoided, and the soil pipes, if there was a cross-ventilated lobby, could be in accessible but not prominent positions on the outside of the walls. The speaker touched briefly on some of the details referred to in the paper. (1) For hot-water supply have cylinder adjoining the kitchen range, with short but large flow and return pipes, and a stand pipe serving as supply to fittings carried up from the crown of the cylinder. (2) For pantry and still-room sinks use framed sinks of teak. They were easily kept clean, were not injured by hot or any water, and no metal linings were necessary to make them watertight; a very ordinary washtub, he said, was watertight. (3) Cregeen's trays, Duckett's channels, Albion slippers and other contrivances with useful ends. It was well to keep waste pipes from fittings well away from waterless traps of gulleys when the traps of fittings were also dry. Such appliances must be kept clean, but no appliances (w.c.'s, sinks, gulleys, traps or trays) should be allowed to take care of themselves for any length of time. Mr. Clarkson noticed the use of varied spelling and various plurals for gully, and suggested the uniform use by architects of "gully" and "gullies." The term "inspection pits," he said, was preferred to "manhole," since the latter conveyed wrong impressions. Easy bends should not be made awkward by little shortenings of the pits, and the use of a valve was advocated to open a special outlet from the ground surface when the ordinary outlet was choked. Underground tanks for rain-water should generally be preferred to cisterns inside buildings, which made architects the slaves of their roofs, especially in a building of good extent; freedom from such petty cares, the speaker said, was worth a good deal, and was not worthless in other cases. An underground tank was cool, and could be easily supplied and readily cleaned. The overflow, if no filtering chamber was provided, should be from a pump at the bottom of the tank, a pipe being carried under the bottom and up the side to the level of the top of the dome. The pipe should lead the overflowing water into rubble in touch with a fair area of permeable subsoil, connections with foul drains being wholly avoided. Flues in walls, lined it might be with pipes all round and otherwise carefully arranged, might be fre-

quently substituted with advantage for pipes as air inlets and outlets from drainage. An abundance of recognisable sanitary pipes on the exterior of a comely building seemed barbarous, and the speaker said a strong effort should be made to obtain public approval of unostentatious flues, well arranged and suitably terminated. In conclusion the speaker said Mr. Smith had given in his paper the results of much patient study and the experience of good practical work.

Mr. J. S. Gibson also supported the vote of thanks.

SHEFFIELD SCHOOL OF ART.

ON Friday Sir Charles Holroyd, Keeper of the National Gallery of British Art, distributed the prizes to students attending the Sheffield Technical School of Art.

The Lord Mayor, who presided, said the school was instituted in 1841 as a school of design for the instruction and training of students in the principles of pure and refined decorative art. Fortunately, at the very beginning, a great genius, Alfred Stevens, became associated with the school, and Godfrey Sykes and Young Mitchell were its early teachers, with the result that the whole work of the students of those early days was dominated by a grand style, which laid the foundation of after-years of renown and success. This traditional teaching was to-day a great power and asset in the school. The sterling value—the mere cost per ounce of some heavy piece of plate, might be reckoned according to the market price of silver, but the commercial value would depend upon its artistic beauty. Such considerations as these, in his opinion, justified the Corporation in granting generous support to the School of Art.

Sir Charles Holroyd said he had a peculiar pleasure in coming to Sheffield to distribute the prizes, because Sheffield assisted him to get a prize at the Slade School of Art, where he studied under Professor Legros. They seemed to have a number of subjects in hand, and some of their classes appeared to be sufficiently complicated. He knew it was not quite fair to judge a school by a syllabus, and he hoped they would excuse his criticisms if they were not just. He noticed under the heading of "courses of study in the various classes" that the word "copies" occurred thirteen times. Copies might be all right—little and good. But if copies were used to the extent of thirteen times in one page, so to speak, he said that copies were bad, however good they might be. What was necessary was to educate the eye—to learn to see. He had had a good deal of experience as a teacher, and the rule that he had made was that he would never allow his student to work from anything that was not a fine work of art—good and beautiful.

The art school, technical or otherwise, should be a place of beauty in all her manifestations. The Sheffield School of Art was well decorated. The criticism he had to offer was that there were too many things on view at once. He would like to see in all schools of art a reserve room, where some of the things might be carefully stored and only put up for view at certain times. They might take a few hints from the Japanese, who only had a few beautiful things on view in their rooms at one time, so that visitors might concentrate their attention upon them. A school of art should be the temple of taste, and its inhabitants, the masters and pupils, the priests and acolytes, the arbiters and devotees of taste in the town. In an ideal school of art why should not the more advanced students be allowed to decorate the fabric under the supervision of the headmaster? All the crafts might be employed for this purpose, and as a painter he felt that a student would gain enormously and would do better work if he was doing it for a set purpose.

He would say to the students, all forms of art were an expression of joy in work. If they were not enjoying their work they must be doing it badly. He did not mean that the final result must please them; on the contrary, no good artist was ever content with what he had done; but they must enjoy the doing of it. Let them carry out in their own workshop, whatever branch of art they followed, the ideas they gained in the school, and at once. Students were too apt to say, "I have a fine idea, but I do not know enough to do it properly yet; I will wait until I know more." He said, "Do it now"; when they knew more they would have other ideas, and they would not do it so well. Let them strike whilst the iron was hot. They might not make a master-work every time, but they would work better for having ideas behind them. Let their surroundings be as beautiful as they could make them. Let them begin by getting rid of all that was false and ugly, even if they had to do with one plate, and get up at dinner to wash it for the pudding. "I often wish I was a bull in

a china shop," added Sir Charles. "But they could at least get a plain white plate. Ewers and basins, too, how horrible they were, almost all of them. Let them cure it by refusing to buy them. The maker would soon learn at least what was ugly then. They must not neglect beauty in the mind, but cultivate their intelligence as much as they could by reading only the best works. Read them often, and read as little trash as was consistent with their duties as good citizens. He knew a man who read Shakespeare all through every year, and he was a first-rate fellow. Let them study the lives of the great masters of their craft. Some would tell them that they would lose their originality by studying an old master. That was not so. The originality that would be lost by such study was poor stuff. One book he would recommend to them all was Vasari's lives of the painters, sculptors, and architects.

The prizes were then distributed.

Sir Charles Holroyd, in replying to the vote of thanks, said he hoped to set apart a room for Stevens's works in the National Gallery for British art, and he should like to hear from those who possessed them. He wished to acquire them for the nation.

The proceedings concluded with a vote of thanks to the Lord Mayor, passed on the motion of Alderman Wheatley, seconded by the Master Cutler.

JEWISH ARCHITECTS.

EVERY metropolitan synagogue of importance erected in the last half century, says the *Jewish Chronicle*, has been built by Jewish members of the profession. The late David Mocatta, who held the important position of architect to the London, Brighton and South Coast Railway, designed the old Margaret Street Synagogue in 1849. That building was replaced in 1870 by the Berkeley Street Synagogue, which must rank as one of the noblest Jewish temples in the world. Nothing could be finer than its imposing interior, spoilt though it has lately been by the removal of its reading-desk to the front of the Ark. The designers of this splendid fabric were H. D. Davis and Barrow Emanuel, the architects of the City of London School on the Thames Embankment, of Salisbury House, and of the Portuguese Synagogue in Lauderdale Road. Of the brilliant life-work of Mr. Nathan Joseph, the doyen of living Jewish architects, to whose fertile brain we owe the handsome Central and Bayswater Synagogues, and whose work outside the community is represented by the buildings, among others, of the Guinness Trust, it would be superfluous to write at any length. His nephew, Mr. Delissa Joseph, has introduced, as architect of the Hammersmith, Hampstead, South Hackney, Finsbury Park and Cardiff Synagogues a practically new style of sacred design, which combines striking beauty with effective economy of space. Nor must we forget that veteran architect Mr. H. H. Collins, whose graceful designs are to be seen in the Borough, the North London, the St. John's Wood and the Southampton Synagogues. In conjunction with his son, Mr. M. H. Collins, he planned that magnificent Elizabethan structure in South Tottenham in which our incurables are palatially housed. Mr. Lewis Solomon, who has lately been appointed architect to the United Synagogue in succession to Mr. Nathan Joseph, designed the Stoke Newington Synagogue, the Hayes Industrial School and the Soup Kitchen. As a youth he gave indication of future distinction by gaining the silver medal for architecture at University College. Among Jewish architects who have come into more recent notice may be mentioned Mr. Frederick William Marks, who is responsible for the latest addition to metropolitan synagogues—that of Brondesbury. Educated at first in London, Mr. Marks comes from Sydney, where he was the founder of the Sydney Architectural Association. He was awarded a silver medal by the Royal Institute of British Architects for an illustrated essay on "Five Famous Domes."

The Royal Scottish Society of Painters in Water-Colours at their twenty-seventh annual assembly elected the following officers for the ensuing year:—President, Sir Francis Powell, LL.D.; vice-president, William M'Taggart, R.S.A.; treasurer, William Young. Council—Walter M'Adam, J. Whitelaw Hamilton, James G. Laing, Patrick Downie, R. M. G. Coventry, and C. J. Lauder, representing the West; and Mason Hunter, Charles H. Mackie, Ewan Geddes, G. N. Langlands, R. Gemmell Hutchison, and C. P. Ross, representing the East.

GENERAL.

The Islington Borough Council have commissioned Mr. H. T. Hare to prepare plans for the library in Manor Gardens, and Mr. M. E. Macartney for one in Essex Road.

M. Marqueste, the French sculptor, has obtained from the Minister of Public Instruction the atelier attached to the Institut which was occupied by the late M. Barrias. The other ateliers are assigned to MM. Chaplain and Rotz, medallists; MM. Fremiet, Thomas and Guillaume, sculptors; and M. Vaudremer, architect.

Mr. J. Horsley Palmer, a past master of the Mercers' Company, has presented a painting illustrating the foundation of St. Paul's School by Dean Colet in the reign of Henry VII. for the decoration of the ambulatory of the Royal Exchange. Mr. T. L. Devitt has presented a fresco entitled "Modern Commerce," and both pictures will be unveiled at an early date.

M. Eugene Guillaume, the sculptor, died in Rome on Wednesday. Of late years he was director of the French school at the Villa Medici. He was born in 1822. His works were admired for their refinement.

On Monday last Messrs. A. W. S. Cross, M.A., and George Hubbard, F.S.A., visited Bristol and read papers before the local allied Society on "Registration." After the papers a full discussion ensued, and a resolution was proposed, seconded, and carried unanimously, "That this Society having heard the respective papers of Professor Beresford Pite on one side, and of Messrs. Cross and Hubbard on the other, is distinctly in favour of the principle of the statutory qualification and registration of architects."

The Earl of Rosebery, K.G., as President of the London Topographical Society, will receive members and guests at the conversazione in Drapers' Hall on March 16 at 8.30 P.M.

The Annual General Meeting of the subscribers and donors of the Architects' Benevolent Society will be held in the rooms of the Royal Institute of British Architects on Thursday, March 9. The president, Mr. John Belcher, A.R.A., will take the chair at five o'clock.

An Etching of the "Interior of Burgos Cathedral," by Mr. A. H. Haig, was sold at Messrs. Christie's on Tuesday for 45*l.* 3*s.*

Mr. Alfred W. Rich will hold an exhibition of his water-colour drawings of English landscape at the hall of the Alpine Club, Mill Street, Conduit Street, W., from March 8 till 25 inclusive.

A Paper on "Lead Work" will be read by Mr. G. P. Bankhart at the meeting of the Liverpool Architectural Society on Monday next.

Mr. David G. Hogarth, speaking at the Royal Institution on archæology on Saturday, said that scientific men would not readily admit archæology as a science, being uncertain as to its aim and province. Archæology must prove itself a study, and must have some end in view. Its immediate function was to serve history as a handmaid; it was, in fact, an ancillary science. One of the advantages of a knowledge of ancient history was that it enabled us to study simpler civilisations, and was a guide to man's action in the present and the future. It had a most important bearing on the problems of modern life. As an instance of this, when the question of feeding indigent school-children was being discussed, a reference was made to ancient Greece. Again, the question of rural depopulation had been faced by the Romans. In olden times problems such as these did arise, and in complicated ways; they were attacked and to some extent solved.

Sir William B. Forwood at a recent meeting of the Liverpool Corporation library, museum and arts committee alluded to the proposed extension of the Walker Art Gallery. The idea is to add some half-dozen rooms for paintings and sculpture on to the first floor, and on the same level as the present structure, thereby carrying the extension over a piece of land which, owned by the Corporation, is utilised for the storage of carts and materials. A rough sketch of the projected addition was laid before the committee, and in due course the matter will come before the Council.

Mr. Edwin T. Hall has been unanimously elected deputy-chairman of the Board of Estates Governors of Dulwich College. Mr. Hall was also recently appointed a governor of James Alleyn's Girls' School, one of the group of schools administered under the Dulwich College scheme.

The Glasgow Institute of Architects have agreed to write the Royal Institute stating that the Institute would be glad if, by putting a clause in the schedule of professional practice as to charges or in some other way, all doubt as to the ownership of drawings could be removed.

SIR R. ROWLAND ANDERSON, LL.D., Architect.

The Architect.

THE WEEK.

THERE is some excuse when railway stations are found to be too restricted in area to meet the requirements of the present time, for the growth of traffic could not be anticipated. Municipal buildings are not under similar conditions, and it is never difficult to foresee the necessities of a future time. The work of the Corporation in Birmingham is hampered from the want of accommodation in the Council House. There have been additions, but the business seems to be growing. It is now proposed to utilise some land which was acquired by the Council. The subject has been under consideration for some time. In 1899 sketch plans were prepared by Sir ASTON WEBB providing accommodation for the health and other committees. At present the tramways, education and housing committees have made claims for additional space, and it is probable the water committee and the gas committee will also ask to be considered. Sir ASTON WEBB, it appears, has expressed his willingness to prepare sketch-plans which would suggest what is possible. But there is a general desire among the architects of Birmingham that the new building should be thrown open to competition. Mr. WHITTALL, who is a member of the Council, said on Tuesday if the architects were sure that would be done many of them would ascertain the best and latest designs in other places in order that they might be able to present drawings which would embody all the modern ideas. It was stated, in reply, that Sir ASTON WEBB had suggested the adoption of that course and would only act as assessor. The arrangement is satisfactory. The Birmingham architects have for some time believed that they were not treated fairly, for strangers were commissioned to erect buildings which were not always of a satisfactory character. They will soon have an opportunity to display their powers by making the competition memorable.

It is not difficult to understand why County Councils and other authorities should be in favour of centralisation and of having few officers to deal with. As they have also private duties they must desire that those which are of secondary importance, although in the service of the public, should be accomplished quickly. On that account many officials become pluralists. Occasionally we find there is rebellion against the arrangement, but it is quickly overcome. For instance, at the last meeting of the Horwich and Westhoughton education committee it was announced that the Lancashire County Council had decided to place the whole of the architectural and surveying work in the hands of the county architect, and that all work must be done through him. It was explained that an officer of the County Council, who held another office, had offered to do the whole of the architectural work for the county education committee for 300*l.* a year, with such staff as might be necessary, the total salaries not to exceed 1,800*l.* a year. Several local committees had protested against the arrangement and asked that delegates should be sent from Horwich and Westhoughton to a conference which is to be held in Manchester on the subject. There is a great difference between theoretical and practical economy, and it is to be hoped the delegates at Manchester will not be led astray by the specious statistics which are usually brought forward on such occasions, but which no honest architect or builder could endorse.

SOME years ago the late Mr. EWAN CHRISTIAN was annoyed at some remarks which appeared in *The Architect* about his conduct as an assessor in competitions. In one instance he was aware that the buildings could not be erected for the sum specified, and in another case he knew there was no money avail-

able. A large amount of labour was accordingly gone through without any advantage to competitors or projectors. There is no doubt that in all cases assessors should not regard themselves merely as severe and impartial judges of designs, but they should realise that by accepting their office they are guaranteeing the honesty and practicability of the transaction. The effect of acting resolutely in such a position has been exemplified by Mr. E. M. GIBBS, in Sheffield. He was invited by the health committee of the Corporation to serve as assessor in a competition of plans for houses which were to be erected by the City Council and to be let at a weekly rent of 5*s.* He considered the project of building houses under the conditions would not be profitable and the competitors' time would be wasted. Mr. GIBBS said he was willing to act if the conditions were modified so as to provide that he might award premiums to competitors whose plans showed the best attempts to successfully solve the question of cheap housing. The effect of Mr. GIBBS's resolution was that the committee reported that it was impracticable to proceed with the scheme. Afterwards Mr. GIBBS announced that he would agree to act as assessor. The Council at another meeting resolved that the question should be referred back to the committee so that they might try to modify the proposed conditions on consultation with the assessor.

WHEN Dr. PERCY was appointed to take charge of the sanitation of the Houses of Parliament, he was surprised and bewildered when he found there were no plans which indicated the drainage arrangements or the positions of the flues. That, no doubt, was caused by the divided authority which was allowed to exist when the great building was constructed. But the absence of the information embittered the struggle a few years afterwards between the Office of Works and E. M. BARRY. The authorities must have assumed that plans were prepared which contained such information as was desired by Dr. PERCY, but they were not given up because it was believed the representatives of the architect possessed a right to keep them. The question of ownership of plans is of course regarded differently by those who pay for the erection of a building and by those who prepare the designs. But it is not incumbent on the latter that they should preserve drawings, although occasions may arise when they would be very useful. A case of the kind has just occurred. The Liverpool Corporation have been able to acquire the architect's drawings for the Picton reading-room, the Rotunda lecture-hall, and the extension of the Walker Art Gallery, works which were executed between 1878 and 1882. The history of the adventures of the documents is not related, but the Corporation have obtained possession of them for five guineas. For reference they will be valuable. It appears extensions are contemplated, and by having them the preliminary work will be facilitated. When a case of that kind is brought before them, can we imagine that judges will conclude that the preservation of plans for public or private buildings should be left to chance?

WHILE M. DUJARDIN-BAUMETZ holds office, French artists assume that they will be treated with more consideration in their dealings with Government officials. One of the signs of the new condition of affairs is seen in the creation of a consultative committee, who will report on the works to be purchased from exhibitions. Among the painters appointed are MM. BONNAT, CARRIÈRE, COLLIN, CAROLUS DURAN, HENNER, LHERMITTE, and TONY-ROBERT FLEURY. There are also sculptors, medallists, engravers, &c. M. VAUDREMER, the architect, is also a member, and he will be able to judge whether paintings or statues are adapted for certain positions in public buildings. The following writers on subjects connected with the arts will also aid in the deliberations of the new tribunal:—MM. ARSÈNE ALEXANDRE, DE FOURCAUD, GUSTAVE GEFFROY, ROGER-MILÈS, and THIÉBAULT-SISSON.

EUGENE GUILLAUME.

TO an ordinary observer the late CLAUDE-JEAN-BAPTISTE-EUGÈNE GUILLAUME did not look like a man who was able to carve marble or to handle modelling clay on a winter's day. We speak of him as he appeared in the streets of Paris some five-and-twenty years ago, before he accepted the Directorship of the French Academy at Rome. He was born in 1822, and after he had passed his seventieth year he was only to be regarded as a very gentle but venerable patriarch. At the time to which we refer he would easily pass for an ecclesiastical dignitary, but one who had not to deal with turbulent subordinates; or he might be supposed to be a consulting physician, or a country gentleman who was the representative of an ancient family. He could be taken for an admirable adviser, but not as an initiator in any kind of business; he seemed unfitted to deal with opponents, for his own life was subjected to exact rule, and he could not understand why other people should not also follow a straight road.

All his life was suggestive of self-sacrifice. He was a native of the South of France, and he was intended for the profession of advocacy. As a relaxation to his courses of law in Dijon he amused himself with modelling. In a short time he imagined that he was better fitted to be a sculptor than a lawyer, and regardless of the sacrifice, he became a pupil of PRADIER. In the atelier and at the Ecole des Beaux-Arts he was a model pupil. If he were a novice of some religious order who had been sent into the world in order that he might learn how to model figures for churches, GUILLAUME could not have been more assiduous. It was inevitable that a student of that kind should be successful. In his nineteenth year GUILLAUME entered the Ecole des Beaux-Arts, and four years later, he gained the Prix de Rome on which he had set his heart.

His term of pupilage was in troubled times. In 1846 JEAN ALAUX, the painter, was appointed Director. He governed the school with tact during the revolutionary period of 1848 and 1849. But probably on that account, and because he did not perform some histrionic feats, his name is now forgotten. He, however, believed in mythology, and it is easy to imagine the kind of works which he desired the students to produce. He was faithful to the traditions of the school, and wished to see nature always idealised. When the Revolution broke out he passed through much anxiety, and in order that the students might not suffer he obtained permission that they should leave the city and travel to Florence, so that they could pursue their studies.

The confidence which GUILLAUME inspired, in spite of his youth, is revealed by his selection to act as diplomatist in the negotiations. The Triumvirs realised that the departure of the French students would be interpreted as an act of hostility to France and of their own incapacity to afford protection to strangers. GUILLAUME had to argue the case with MAZZINI and his coadjutors. He had also to persuade the War Department to lend him six horses and conveyances. At length he succeeded, and among those who left Rome were FELIX BARRIAS, the sculptor, who lately died; CABANEL, the painter; CHARLES GARNIER, the architect; EUGÈNE GUILLAUME, besides M. and Mme. ALAUX. When they reached Florence they had no resources, but the French Ambassador aided them; they rented a small house in a back street, and they resumed their studies in galleries and churches. When they were able to go back to Rome they found the gardens and the outer ateliers in ruins, but the palace was intact. In time they settled down to their duties, but the French Government and people gave no attention to what the Director and students had gone through.

On his return to Paris EUGÈNE GUILLAUME demonstrated his progress by his *Faucheur*, his *Anacreon* and his *Gracques*. He was not a companionable student, and no stories of good-fellowship had prepared the way

for him in Paris. The critics were severe upon him. MILLET had demonstrated about that time that a peasant when faithfully treated could be made an agreeable object. The *Faucheur*, which was a figure entirely nude, was by some considered absurd, and the *Anacreon* was declared to be too chilling a representation of the amorous and bibulous poet. In spite of adverse judgments the three works were acquired by the State.

EUGÈNE GUILLAUME apparently had what seemed to be an instinct for the principles of the union of the art which was the aim of the French Government to promote during two centuries. He recognised that architecture was entitled to the best skill of a sculptor, and he therefore made no objection to execute several figures and other decoration for the exterior of the Louvre, a kind of employment which laid him open to a sneer from EDMOND ABOUT. A more extraordinary proof of his abnegation in the same line was his undertaking a series of bas-reliefs representing scenes from the life of the patroness of the church of Sainte-Clotilde. That church, which was commenced by M. GAU and completed by M. BALLU, is an example of modern French Gothic. It was therefore necessary that he should adapt the Classic style, in which he had practised, to new conditions. As was to be expected, the reliefs are neither Classic nor Gothic, but they seemed to be less out of place than the sculpture by PRADIER, TOUSSAINT and DURET in the same building. We may, moreover, mention here that EUGÈNE GUILLAUME also produced some of the statues for the church of La Trinité. His *Instrumental Music* is one of the groups which adorn the lower part of the Paris Opera House.

There are very few of GUILLAUME's figures to be seen in Paris. His *Claude Bernard* is near the Collège de France. In the Luxembourg there is a bust by him of Archbishop DARBOY, who was executed by the Communists; it has some novelty, for the prelate wears a richly embroidered cope and has a mitre. In the Ecole de Beaux-Arts is a bust of INGRES, an artist who was somewhat like himself. GUILLAUME was not a pushing man, and many commissions for public works, which he could easily have obtained, were allowed to pass into hands that might be more forcible, but were less capable of producing refined sculpture. The proof of the esteem in which he was held is his membership of the Académie Française, as well as of the Académie des Beaux-Arts. For fifteen years he was Director of the Ecole des Beaux-Arts, then he became Director-General des Beaux-Arts. He was also professor of æsthetics and the history of art in the Collège de France. As Director of the French School in Rome he upheld the old traditions during several years, and he was allowed to retain the office although he passed his eightieth year. The Villa Medici was so dear to him that when he left the building he took up his lodgings in a neighbouring house. He had intended to have spent some weeks in Naples, but he succumbed last week to an attack of bronchitis.

EUGÈNE GUILLAUME, as an Academician and a man who believed in culture, could not approve of the old system by which artists were indifferent to all means of education except that of the atelier. The artist was, he maintained, entitled to take advantage of whatever existed which he could turn to account. He did not believe that art could live apart from history or archaeology, nor could the artist be indifferent to science. There was no necessity for him to exhibit himself as a pedant, but he should be regardless of any labour in studying if he could only make his work more truthful. Indeed, GUILLAUME considered that science was sure to aid the artist if it did nothing else than introduce order into his works, which was one of the conditions of beauty. There were some theorists who believed that art and science were antagonistic, that science was one day destined to usurp the whole region of sentiment, and then art would come to an end.

GUILLAUME agreed that the boundaries of science were to be enlarged, for that was a necessity of progress. But he asserted that profound emotions would arise whenever the human mind came in contact with nature, and there would be always poetry and art. To believe otherwise would be to suppose that art could suppress a part of human nature. In that faith he continued to the end, and we may thus regard EUGÈNE GUILLAUME not merely as a link with the past, but as one of the first representatives of the twentieth century and the future.

SPIERS TESTIMONIAL ESSAYS.*

WHILE the world lasts we suppose it will have the advantage of possessing men who, with ULYSSES, are impelled "to follow knowledge like a sinking star." What they accomplish is not always considered as profitable in the ordinary sense either to themselves or to others. But the instinct is able to surmount adverse criticism. Mr. PHENÈ SPIERS worthily deserves to be classed with those seekers after knowledge for its own sake. He has drawn and examined more buildings than any man known to be living, and he must be convinced that few among his subjects are adapted to be accepted as models for modern use.

Indeed, as regards construction, there is no advantage in ascertaining what was done by ancient builders. Materials can now be used as well as in the old days, and they can moreover be wrought into form with greater expedition. Mr. SPIERS, for instance, in speaking of stalactite domes, refers to OWEN JONES'S reproduction of the Hall of the Aberranges in the Crystal Palace. He says that "they are the most complicated arrangement I am acquainted with; something more is required before I shall be able to understand how he carried out the work." Now the whole of the work at Sydenham was executed by HENRY A. SMITH and his two sons, assisted by a very intelligent body of English workmen. "It is impossible," says OWEN JONES, "to praise too highly the zeal and intelligence of Mr. SMITH; by an endless variety of expedients for economising labour he has succeeded in clothing with ornament the 'Alhambra Court' in an incredibly short space of time." How HENRY SMITH and his associates surpassed the Moorish artists has been also described by OWEN JONES:—

In the Casa Real they [the stalactite arches] were built up brick by brick, and simply strengthened by pieces of lead, and no part of the palace is in a more perfect state of preservation. Our first desire was to construct these roofs and pendentives in the same way, bit by bit; but, on reflection, we thought that as the lesson it would teach could not be seen when completed, and could not be watched during its progress by the public, it was preferable to adopt a more economical and rapid process which modern invention had placed at our command. The invention of moulding in gelatine has been of essential service in aiding the rapid execution of the Alhambra Court, and in no case so signal as in the making of the stalactite arches and roofs. Instead of building them up on the spot the various combinations have been made on a table with the single stalactite bricks, and the combination moulded and fixed up in its place in one large single block; where combinations are many times repeated the saving in time has been very great. It is difficult to conceive to what extent the Moors would have been led by their vivid imaginations had they been acquainted with gelatine moulds. They do not seem to have been acquainted with piece-moulding or the use of wax or any elastic material, as there is no undercutting in any of their ornaments, and they could all be drawn out of a mould in a single piece. According to the Spanish historians this mould was of wood, and, if this be correct, the simple labour of casting the various patterns

from such an unyielding substance must have been very great.

THÉOPHILE GAUTIER considered the stalactites in the Alhambra to resemble the product of some fortuitous crystallisation rather than the work of human hands. He would probably undervalue the reproduction at Sydenham because it took a short time to complete and was produced at a low cost. But the case shows the difference between past and present and the superiority of the modern system of carrying out work. But if one of the workmen who were engaged in the court of the Crystal Palace were asked what was the meaning of such a mode of ornamentation and how it arose he would not be able to answer. It is doubtful if one of the Moors who worked under IBNU-L-AHMAR would be wiser. The origin of the stalactites is, however, one of the obscurities in architectural history which Mr. PHENÈ SPIERS has endeavoured to elucidate. It requires more research than is commonly supposed. FERGUSSON, who believed that a system of corbelling would overcome many modern difficulties in construction, and would make the adoption of concealed iron beams as lintels unnecessary, was of opinion that the stalactite or honeycomb decoration could be traced back to the Indian practice of bracketing with imitation of arches which was adopted in India by the Pathans. That view is not accepted by Mr. SPIERS, who believes that the mode of decoration was derived from Persia, where a somewhat similar class of work is still undertaken.

All the essays in Mr. SPIERS'S volume deal with subjects which are controversial. In "Mahometan Architecture" he endeavours to explain how it happened that while MAHOMET sought only extreme simplicity, his followers, wherever they went, erected mosques which still are admired for their beauty. He examines in detail the decorative features, viz. the entrance porch, the minaret, the open loggia and the dome. Describing the great porch at Fatehpur Sikri, of which FERGUSSON gives an illustration, he says:—"It contains the first principles which should be observed in all monumental design, and with which architects of all periods have constantly been struggling—first, to obtain grandeur by the introduction of large features; secondly, to give scale to these features by subordinate ones."

Another interesting subject is treated in "Sassanian Architecture." The dynasty of SASSAN, although lovers of art, made war almost on the scale of that now raging in the East, for at one great battle 100,000 Persians were slain. Several of the monarchs sought renown through architecture, and remains exist in which we see more than one influence. Although the Romans were defeated their conquerors appear to have taken instruction from them in the arts. On the other hand, Eastern inspiration appears to be no less evident. Mr. SPIERS believes that Sassanian work forms "a connecting link between Assyrian and Babylonian architecture on the one hand and Byzantine work on the other." The vaulting is curious from the preference given to elliptical contours which required little expense for centring. In the palace at Ctesiphon an arch has a width of 85 feet at the base, it is 105 feet high and the hall it covers is 163 feet in length. The ornament is generally of a florid kind, and the vine seems to have been a favourite pattern. Susa was one of the capitals of Persia, and was therefore under Sassanian rule. M. DIEULAFOY explored the site of the palace and there found the remarkable examples of decoration in pottery which are now to be seen in the Louvre. Mr. SPIERS objects to the explorer's restorations as shown in the engravings of his book. One important error is the introduction of antæ, for which there appears to be no surviving example in any remains of Persian architecture.

A paper which was read in 1893, on the influence of Byzantine Art in Italy from the fifth to the twelfth century, has also been reprinted. The information is derived mainly from DE DARTEIN'S and CATTANEO'S books.

* *Architecture, East and West.* A Collection of Essays written at various times during the last sixteen years. By R. PHENÈ SPIERS, F.S.A., F.R.I.B.A. Now first brought together and issued with further illustrations as part of a testimonial to the author. (Published for the Committee of the Spiers Testimonial by B. T. Batsford.)

The reason given by the author for preferring Italy to Byzantium is thus stated:—"For our immediate purpose as revivalists of principle in architectural design the unconscious adaptation by a nation of a foreign style may possibly teach us lessons which the study of the originals would at first fail to impart to us." But throughout the essay there is reference to the differences between the originals and the adaptations, as in the following extract:—

In the Byzantine capital animals or birds are rarely carved; the eagle, the lion, the lamb and the ram's head occasionally take the place of the volute, and support the angles of the abacus, but are probably not found in more examples than from 3 to 5 per cent. In the Italo-Byzantine capital it is almost the reverse. Animals and monsters and figures of all kinds decorate their capitals, relieved with interlaced work of various patterns. Though bold and vigorous, the carving of these animals is very barbaric, and it is only when they reproduce those animals or bird forms which occur occasionally in Byzantine capitals that the treatment is properly conventionalised and good. In fact, the finest capitals of the eleventh and twelfth centuries are those in which the artists have felt the influence of Eastern work and tried to reproduce it.

The church of St. Front, Perigueux, is a building which is always likely to receive attention in proportion to the care given to the study of architectural history. Apparently no document which can be relied on has been discovered which gives the date of the foundation of the building. It is therefore impossible to say whether the church was built in imitation of St. Mark's in Venice, and whether it is not the oldest church of its class in the South of France. Mr. PHENÉ SPIERS relies on the character of the masonry, and especially the vaulting, as affording a clue to its origin. His conclusion is that the masonry is of a more perfect kind than is found in buildings erected in the twelfth century; that there is no Byzantine feeling in the capitals, which are of an advanced Romanesque character. Finally, although the plan and general design may recall St. Mark's, the domes are of a form that is peculiarly French. There is a short essay on Jerusalem churches, and one on the great mosque at Damascus which was partly destroyed by fire in 1893, but has been restored. Finally, there is an essay on the influence of Greek art on the Persian order.

The essays relate to a large part of the earth and to a long period of building. But if we take the dome as the leading principle, it will be found there is unity in the volume. Much of the information given in the pages is either derived from observation, or is tested by it. The essays are, therefore, supplemental to the histories generally used. But, apart from the information, they have interest as a memorial of Mr. PHENÉ SPIERS's long and consistent efforts to elevate architecture without any thought of his own interest. He is the one Englishman who is recognised by American, Colonial and foreign architects as the honorary representative of the art to whom they can have recourse whenever advice is needed. His book may also be considered as having an international character, for who is without interest in subjects connected with Greece, Italy, Egypt, India, Persia and France?

The Civil Service Estimates for the year ending March 31, 1906, show that under Class 4, "Education, Science and Art, United Kingdom, and England, Scotland and Ireland," there is a net increase of 533,409*l.*, the amount for 1905-6 being 16,328,947*l.* The details for the United Kingdom and England include:—British Museum, 170,501*l.*; National Gallery, 19,014*l.*; National Portrait Gallery, 5,619*l.*; Wallace Collection, 6,593*l.*; the National Gallery for Scotland, 5,405*l.*; and the Irish National Gallery, 3,096*l.* The Public Works and Buildings estimates require a grant of 2,697,710*l.*, of which amount 62,500*l.* is required for the royal palace, 105,400*l.* for the royal parks and pleasure gardens, 56,700*l.* for the Houses of Parliament, 633,700*l.* for revenue buildings, and 464,000*l.* for public buildings in Great Britain; 32,000*l.* is to be voted for Peterhead Harbour, and 59,632*l.* for railways in Ireland.

THE CATHEDRAL, BIRMINGHAM.

ON the 2nd inst. the Right Rev. Charles Gore was enthroned in the cathedral church of St. Philip and St. James, Birmingham. In the *Birmingham Daily Post* two large views of the building were given with a description, from which the following is taken:—

Standing on the highest eminence in the city, and surrounded by a picturesque churchyard, St. Philip's Church is admittedly a good example of the Italian style of architecture, has always been a place of interest to the sight-seeker and visitor to Birmingham. The church is built in stone, and is about 140 feet in extreme length and 75 feet in extreme breadth. At the western end, between the two entrances is a square projection. Above rises an elegant tower with Corinthian pilasters, carried upwards by a series of carved figures (now almost defaced), within which are enclosed the four dials of the clock. A well-proportioned dome, with lantern cupola and ball and vane, surmounts the tower. The picturesqueness of the building is enhanced by a number of urns which adorn the parapet. Large and well-proportioned windows are enclosed in a range of lofty Doric pilasters. The church was designed by Mr. Thomas Archer, who was one of the Commissioners appointed to superintend its erection. He was the son of the member for Warwick, and in the reign of Queen Anne was a Gentleman of the Bedchamber. Mr. Archer was a pupil of Sir John Vanbrugh, and as a young man was, it is generally thought, on friendly terms with Sir Christopher Wren, the designer of St. Paul's Cathedral. To the Wren churches St. Philip's has many points of resemblance. Hutton, the Birmingham historian, goes so far as to suggest that the steeple was erected after the model of St. Paul's, and the historian then adds:—"Though without its weight, it does honour to the age that raised it and to the place that contains it. Perhaps the eye of the critic cannot point out a fault which the hand of the artist can mend; perhaps, too, the attentive eye cannot survey this pile of building without communicating to the mind a small degree of pleasure. If the materials are not proof against time it is rather a misfortune to be lamented rather than an error to be complained of, the country producing no better."

Unfortunately the stone used in the erection of the church was of a flaky nature, and in the middle of the last century yielded so rapidly to the combined operations of time and weather as to threaten the speedy defacement, if not destruction, of every jutting angle or ornament of the exterior. The question of restoration had to be considered and in 1864 the south-west portion was generously rebuilt at the cost of a member of the congregation. A few years later the work of restoration was continued by the generosity of the members of the congregation and their friends. The last portion of the body of the church was finished in 1869. The tower remaining in its original condition, the impression might be given that the church belongs to two epochs. One historical writer aptly observes that to the casual visitor the curious problem will be presented as to how a structure so much older in appearance found its way to the top of a comparatively new-looking church. A range of fluted Doric columns runs along each side of the nave. They bear semicircular arches and support the galleries overhanging the side aisles. Seating accommodation was provided for about 1,100 persons. Rather more than twenty years ago effect was given to a further scheme of restoration. The chancel, which is one of the chief architectural beauties of the church, was added. The fine Corinthian columns and pilasters harmonise well with the other portions of the church. The chancel floor was laid with black and white marble, and new choir and clergy stalls were erected. On the appointment of the late Dr. Bowlby as the Suffragan Bishop of Coventry a bishop's seat was also added. The organ, with its fine oak case, which for many years stood in the west gallery, was removed to its present position in the north side of the chancel. The gallery was taken down and the space beneath the tower thrown open, forming a handsome baptistery. The roof of the church was also extensively renovated. Exclusive of the chancel the cost of the alterations and repairs carried out in 1883 and 1884 amounted to 5,000*l.* In July of the latter year the edifice was reopened by the then Bishop of Worcester.

One of the chief glories of St. Philip's is the beautiful stained-glass windows, designed by Sir Edward Burne-Jones, distinguished citizen and Old Edwardian, and executed by William Morris. They are four in number and depict (the three in the chancel) "The Nativity," "The Ascension," "The Crucifixion," and "The Last Judgment."

in the baptistery window—a fitting memorial to Bishop Bowlby, an esteemed former rector. All the windows are characteristic of Burne-Jones's most artistic religious work. The Bowlby memorial window, which was unveiled only eight years ago, is generally regarded as the most striking.

Although the work of building the edifice was commenced in 1711, evidence is not wanting to show that the designer had his plans prepared long before that date. It may be that the merit and beauty of his drawings influenced the movement. At any rate, it is recorded that on May ye 23rd, 1709, the Commissioners, sitting at the Old Swan Inn (a famous coaching-house then situate in High Street), decided to go on with all expedition with the building of ye church, and to lay ye foundation-stone this summer." At the same time the Commissioners also resolved "to contract with workmen, to lay in materials, and to appoint overseers of the borough to collect one-half of the money, such money to be paid into the hands of Mr. Christopher Vaughton." The Commissioners present at this particular meeting were William Lord Digby, Sir Charles Holt, Bart., Sir John Bridgeman, Bart., Cleobury Holt, Arden Adderley, William Dugdale, William Binckes, Doctor of Divinity, and Henry Holden, Doctor of Physic. Many of these names will be readily recognised by old Birmingham residents. The new chancellor of the Birmingham diocese (Mr. J. S. Dugdale, K.C.) is a descendant of Mr. Dugdale, one of the Commissioners, and the venerable Lord Norton, who is one of the vice chairmen of the bishopric committee, is the head of the Adderley family.

The site, the gift of Mr. and Mrs. Robert Phillips, who were connected with the Inge family, was at the time quite outside the town. It was formerly part of a farm belonging to the Augustinian Friars of Bull Street), and bore the name of the Horse Close, afterwards the Barley Close. The nearest buildings were those of Bull Street, and during the year of the consecration of the church a narrow passage was made to it from that thoroughfare. That was known first as "Tory Row," and subsequently by "Temple Row"—its name to-day. The immediate neighbourhood was agricultural land. There was a cherry orchard on the spot now occupied by Cherry Street. For many years afterwards corn flourished in Bennett's Hill; this circumstance was within the recollection of the parents of many citizens of to-day. It strikingly demonstrates the extraordinary modernity of the city. At the time the site of the church was valued at rather more than 100*l.*, and there is a minute in the book of the Commissioners which states that on "July 18, 1709, Mr. Christopher Vaughton was to pay Mrs. Phillips 2*l.* 10*s.* for a half-year's rent of the Horse Close." In 1798 the latter leased for 120 years three fields reaching to New Street, at a small agricultural rent. In dedicating the church to St. Philip (which took place in 1715, four years before the completion), Hutton points out that the memory of the donor was thus perpetuated by being put in partnership with that of a saint." Though this practice of perpetuating the surname is somewhat unusual, there is another instance of the practice in Birmingham—St. Mary's Church, Whittall Street, named in honour of Mary Weaman, who gave the site.

The church was built by subscriptions, a large part of the money being collected by the overseers. Substantial donations to the building fund were also received from many towns in the Midlands. The building work was entrusted to a number of small contractors. One of these contracts, which was signed by John Cash, Richard Pinley and John Willinger, reads thus:—"We do promise and agree with the said Commissioners, that having bricks delivered in the Horse Close at 8*s.* per 1,000, and sand gotten and water allowed, we will well and substantially lay ye said bricks, and find lime and all other materials belonging to a bricklayer, and build ye said church according to ye draft now agreed on by 3*l.* per rod; and that we have a hundred of boards to make mortar tubbes, and that ye work is begun to go on with all convenient speed we can."

The minutes of the various meetings of the Commissioners are brief and to the point. At the August meeting resolution reads, "That Mr. Charles Blackum do contract with Darby for forty fother of lead at ye best advantage he can for ye use of ye said church." A large quantity of the stone required for the edifice was obtained from the quarries at Rowington, near Stratford-on-Avon. The contractor was a William Shakspear, who gave the following undertaking:—"I, William Shakspear, of Rowington, in the county of Warwick, do promise and agree with ye Com-

missioners to deliver at ye pit in Rowington Quarry ready for loading two hundred loads of stone at 4*s.* a load, each load containing 20 feet broken according to scantlings of Mr. Smith." (He was the clerk of works.) The wording of many of the contracts, no doubt well understood by the Commissioners, is by no means clear. It is quite impossible to gather from the entries the exact extent of the work agreed upon, or, in some instances, even of its character. This will be seen from an agreement, typical of others, which reads as follows:—"I, Joseph Pedley, do promise and agree to do ye plain of ye stone-work for 2½*d.* per foot, and ye mouldings at 7*d.* per foot, but if ye Commissioners find 7*d.* per foot for moulding not enough they to give something more." The Commissioners appear to have been well disposed to all who assisted in any way in the building of the church, and although at the present time much is being said against the system of "tipping," some such practice seems to have been carried out in those days. For instance, there is one minute which orders that 5*l.* shall be paid to a workman for his "paines about ye new church," while there is another resolution which stipulates that on the great festival of May Day 1710, which at that time was one of the greatest pleasure festivals of the year, a gratuity of "ye sum of 4*l.* 10*s.* 9*d.* shall be distributed by ye Commissioners among the workmen and labourers at ye church as they in their discretion shall think fit." The man Joseph Pedley had evidently taken a prominent part in regard to the negotiations for the supply of stone required for the church, and he is awarded "six-and-thirty pounds in consideration of his hard bargain made for the Commissioners."

SPECIALISTS AND ARCHITECTS.*

IN attempting to discuss the relations of specialists to architects, a difficulty at once presents itself in the varying factors of the professional equipment of the architect, the personal qualifications of both the architect and the specialist, as well as in the particular work which the specialist is called upon to do.

An architect of large and constant practice can afford to have complete or approximately complete provisions in his own office for every department of work covered by his practice. This is necessarily an expensive service to maintain, but the conditions are ideal for the execution of the best work. In such a case the controlling head employs only such specialists as assistants as will do his bidding in their relatively subordinate places, or whose independent work can be relied upon to conform to the known traditions of the office. It is possible also that the designers in the more purely architectural departments should be given a general oversight of the allied departments. Offices of this importance, however, are extremely few.

There is a second and larger class of offices, in which the conditions of American practice warrant the maintenance of a construction department, equal to handling the special as well as ordinary problems of steel-skeleton construction and heavy building, in addition to the necessary departments of design. The constructive engineer is generally capable of dealing with the mechanical problems of heating and ventilation, power plants and electrical installations.

By far the largest class is obliged to have not only the problems of special construction and mechanical engineering solved by specialists employed temporarily, but, in common with the second class, also problems of sanitation, landscaping, interior decoration, models of ornament, and such other work as general practice implies. In this class, the smaller the practice, the greater is the difficulty of securing the assent of the client to the extra fee which the employment of the specialist necessitates, and, it may be added, the greater the difficulty of the architect in securing a satisfactory specialist.

With the growing importance of the specialist, the acknowledgment that he has come to be a necessity, emphasised by such statements as that in the "Schedule," which provides that his services are to be paid for "by the owner" in addition to the fee paid the architect, contains a germ of harm to the best interests of the architect, in so far as it encourages too great independence on the part of the specialist. For the prime requisite toward the ultimate success of any building is that the architect, either in person or by a responsible deputy, shall

* A paper by Mr. Edgar V. Seeler, read at the annual convention of the American Institute of Architects.

be in full control of every individual item which goes to make his building a complete whole.

It may be generally admitted that the engineering specialists are much more tractable as associates than those specialists whose work requires a more definite artistic sense. Capable engineers are numerous, and they have no sentiment of hurt pride in admitting that they know little of art.

It is also probably true, on the other hand, that the artist's distaste for engineering makes it easier for the engineer to accomplish his purpose, so that in designing, the architect is more willing to make concessions to the engineer, or to meet him half way, than if the engineer presumed beyond his true sphere. The architect comes to know after very little experience that heat-flues, steam-pipes, electric-conduits, plumbing lines, demand space for their proper operation, and he allows for them, even though vaguely.

Again, it must be remembered that the engineering expert, whatever his particular branch, is not always capable of determining just what is meant by plans, nor of seizing at once the particular object which the architect wishes to accomplish. If the engineer is lazy or set in his ways, he is prone not to devote any more time to such work than is actually necessary to accomplish his own results, irrespective of their artistic merits.

The architect, therefore (and it cannot be urged too strongly), must in self-defence exercise a close supervision over the work of the engineering expert. He will require tact and persistency, in order to get the most out of the ingenuity which the engineering expert frequently possesses. He must, in every case, have it definitely understood that no work in those departments is to be finally determined without reference to him for its ultimate effect in the sum total of his building.

The landscape architect, the interior decorator, the glass designer, being men in whom the artistic sense is indispensable, are perhaps the most difficult of all to control; the more so that their functions are in many ways as important as that of the architect himself. Fortunately, these experts are much less fractious now than they were ten years ago; but the lack in each is usually due to a misapprehension of the relation which his work should bear to the building of which it is an adjunct.

It is a pity to have to admit that many architects do not consider the setting of their buildings or the treatment of interiors as an integral part of their design. It is a greater pity that many architects are not qualified to determine such questions. For such architects little respect can be expected from the specialist. The architect is of no help to him and is not sensitive enough to appreciate the work of the specialist. The incentive to the best effort is absent.

On the other hand, where an architect has mastered, if only in a general way, the principles of good design, where he has a clear conception of his completed work, he should have no difficulty in modestly but firmly impressing his convictions upon the specialist.

The term "landscape architect" is an anomaly. The chief service of the landscape artist—since it seems to be the only term available—is to apply his knowledge of planting, of the growth, form and colour of vegetable life, to the details of the general scheme of grounds or setting which has been correlated to the building and developed in its architectural work by the architect himself. The landscape architect should not be called upon to determine whether gardens shall be sunken or raised; whether walls, balustrades, dials and such accessories shall be of one mass and design or another, of one material or another; whether the formal garden shall be on this axis or that, or off axis altogether: to determine these things is the duty of the architect. The service of the landscape architect should mean advice in the choice of plants, in the relative value of trees, shrubbery and vines, in the planting of lawns and hedges, and in those items which are the result of special nature study and intimate living with nature.

Regarding the interior decorator, there is no possible slaughter worse than that he can accomplish, and usually does accomplish, with an otherwise harmless if not entirely wholesome architectural interior. And with the interior decorator may almost be classed, in ruthless disregard of architectural principles, the artist of eminence to whom is entrusted the picture panels. Puvis de Chavannes is almost the only modern who has realised the dignity of his work, and it is an open question whether, in the one or two examples of his work which we have the good fortune to

possess in America, he would not have changed his colour scheme could he have seen its surroundings in advance.

Of designers in glass and mosaic, how many can be trusted undirected with a work of importance, without the risk of their introducing an irrelevant style or an inharmonious colour note?

The only guaranty of the perfect working out of the various parts in the make-up of a building lies, first, in the education of the architect, whereby he himself is competent to conceive, to express and to execute, or to select from around him those who can do so; and, second, in the untiring supervision of his executants.

An interesting side of all this is that the intelligent specialist, whatever his work, is usually willing and desirous that general lines shall be laid down for him. He knows that his work gains in dignity, grows more interesting in variety, and helps more in the accomplishment of a unified result than would be possible under any other circumstances.

There is no reason in the world, other than deficiency of some sort on the part of the architect, why the architect and the specialist should not work side by side in entire harmony under the acknowledged leadership of the architect and the willing acquiescence of the specialist.

INDIAN MONUMENTS.

THE beautiful palaces and tombs, the mosques, the temples and the forts which still adorn India, whether in their perfection or in their decay, are, says the *Times*, but the survivals from the successive waves of destruction which have broken over the country. Innumerable others have vanished, leaving gaps in the continuity of the historic record of twenty-two centuries, the comparatively short period which has elapsed since the erection of the oldest building at present known to us.

As Brahmanism regained its ascendancy over Buddhism in India, many of the architectural records of the disappearing religion were ruthlessly destroyed or left to decay, cities and temples were buried under heaps of rubbish, overgrown by forest. But if the Brahman destroyed neglected the relics of Buddhism, he at least filled the place by temples and palaces of his own. The Mogul, in turn wrought havoc amongst religious buildings which, to him, represented nothing but a hateful and wicked idolatry. The fanaticism of a religion still in its early fervour urged him to iconoclasm, just as Cromwell's soldiers were impelled to mutilate and destroy what, to them, represented the survival of idolatry. The Mogul conqueror ruthlessly destroyed the palaces and buildings of the conquered; yet, like the Brahman, he atoned to some extent for his vandalism by works as beautiful as those which he demolished, working in harmonising with his own religious and artistic ideas. He built into his mosques or his palaces the materials of buildings which his fury, or his frenzy, had impelled him to raze. So again, Ranjit Sing adorned his Golden Temple at Amritsar with the spoil of mosque and tomb. In some cases, the caprices or the jealousies of successive rulers resulted in destruction or abandonment of the works of their predecessors even of the same dynasty, witness the ruins or incomplete buildings of Delhi and Fatehpur Sikri. Of all the invaders earlier than the British, the Maharrattas and Nadir Shah were among the few whose mission was solely destructive. The Moguls marched as a complete nation to seek a new home, bringing with them, besides their armies, their culture and that architecture which reached its highest development in the Alhambra and the mosque at Cordova in the west, in the Taj and the palaces of Agra and Delhi in the east.

With the English it was different, for they came at first as peaceful traders, though the force of circumstances compelled their development into soldiers and empire builders. No fanaticism urged them to destroy the monuments of the great religions which they encountered. They were tolerant by inclination as by policy; they had no wish to efface the memory of their predecessors. But if they were not active destroyers, they were equally not constructors of beautiful buildings. They brought no artists or architects. When they found a building suitable to their purpose they occupied it, or adapted it by alterations or additions in which harmony and beauty were alike sacrificed to convenience and utility. When they had to construct new buildings the same considerations prevailed. Private houses, public offices, churches, all bore the mark of men who built for utility not for beauty. They even added terrors to death by

expressible hideousness of the monuments which are to be found in every old Anglo-Indian cemetery, even almost under the shadow of the most perfect examples of Mahomedan tombs. As for the relics of the past, the East India Company had neither money, nor leisure, nor inclination for their preservation or repair. It recognised its duty in this respect. How could it be expected to do so when it was only after many years that it even awoke to its obligations in the making of roads and the construction of public works? As time went on a few exceptional men drew attention to the interest of the history of the past as recorded in the ancient languages and inscriptions of the country. It was not till nearly the middle of last century that Fergusson and Cunningham gave an impulse to the study of Indian architecture as an art or as a record of history. To them is due the rise of a continuous effort to preserve the monuments of the past. Here and there Governors-General had ordered a few repairs or researches, but their spasmodic efforts were more than neutralised by the vandalism of men who contemplated the sale of the Mahal for the value of its materials, or actually put up at auction Shah Jehan's marble bath, torn from his palace at Agra.

At last, Lord Canning, in 1860, showed his recognition of the duty incumbent on Government to preserve and study the monuments of the past by constituting the Archaeological Survey of Northern India under General Cunningham. The Viceroy saw that such work could not be left in India to private persons or local bodies. His views spread but slowly through the official hierarchy. Local administrations had more urgent demands on their limited resources; it was only governors of the stamp of John Strachey who saw their way to real work in the preservation or restoration of the magnificent remains in their charge. Now and again a district officer of taste and culture would do something in the way of conservation, or would seek generally in vain to inspire his local engineer with some rudimentary æsthetic sentiment. Elsewhere there were misguided men who prided themselves on having persuaded the custodians of a tomb or a mosque to decorate it with a coating of whitewash. Others could regard with indifference the intrusion into an emperor's marble audience hall of a soldiers' canteen or of brick partitions and glazed doors.

Lord Northbrook followed in Lord Canning's footsteps. Lord Lytton, a man of artistic tastes and Imperial ideas, gave liberal grants for repairs, and proposed the appointment of a Curator of Ancient Monuments, an office which was worthily filled for a few years by Major Cole, who did some good work. But, to speak generally, archæological work gained little popularity beyond the limits of the department. When Dr. Burgess, the successor of General Cunningham, retired in 1889 from the directorship of the Archaeological Survey, the appointment was allowed, on grounds of economy, to fall into abeyance. Provincial surveyors were left, but they had no controlling adviser and little progress was made. In 1898 Lord Elgin once more took up the question of reorganisation of the department, which Lord Curzon completed. India, including Burma, was divided into five circles, each under its own surveyor. Over them a trained archæologist, Mr. J. H. Marshall, was appointed to supervise operations, to initiate plans of repair or restoration, to prepare lists of existing monuments, to advise generally, and to carry out himself all works of great urgency. Local administrations have been urged to spare whatever is possible for the work, and have been helped by grants in aid from a central fund when local resources were overtaken.

The first report drawn up by Mr. Marshall shows at once the difficulties he has had to contend against, and how much he has already done in organising and in preparing a well-considered programme. Much material for records has already been collected, but not yet published. Until this has been worked up, this branch of work must give place to the more urgent calls of repairs and restoration, and to the checking of vandalism or the disastrous interference of uninstructed persons, which are still far from common; vulgar sightseers continue to disfigure walls with their signatures, wealthy custodians of a temple are anxious to cover its inscriptions with whitewash. The beautiful Tower of Fame at Chitor was rescued, only just in time, from demolition preparatory to rebuilding. The work had already been begun, under the advice of a railway engineer, when a timely report enabled the Viceroy to stop what was certainly an unnecessary, probably fatal operation.

It is affirmed that very substantial progress has been made in conservation, for which thanks are due to local administrations for funds provided, as well as for increased interest displayed. But, above all, success is mainly due to the interest of the Viceroy in the operations, and to his unstinted support of the Director-General of Archaeology. When, in the course of his tours, Lord Curzon's sense of artistic propriety is offended by the profanations of local officials or of the engineer's paint-pot and bricks, he refuses to rest till he is satisfied that the scandal has been removed. Where the Viceroy leads others will follow. Already there are signs of the passing of the age of neglect, and grounds for hope that English official buildings of the future, even outside the Presidency towns, will no longer be the eyesores they have hitherto been to every lover of the beautiful.

BRITISH EMBASSY, PARIS.

THE fine building of the British Embassy in the Faubourg St. Honoré, at Paris, which during the past six months has been in the hands of workmen engaged on the important work of repairs and restoration under the direction of Mr. Arthur Vye-Parminster, the official architect at Paris, is nearly ready for re-occupation, the house being now in the hands of the upholsterers. The history of this building is interesting on account of the many illustrious persons who have dwelt within its walls, and the rich interior decoration reminiscent of the various styles from Louis XIV. to the later days of Louis Philippe and the tastes of the guests of each epoch. The "hôtel" was built towards 1717 for the Duc de Charost, and its exterior architecture is of the style of Louis XIV. Franklin inhabited the building for some time, and it is stated that he installed on the roof of this house the first lightning-rod seen in France. The interior decoration underwent considerable modification and improvement under the influence of Pauline Bonaparte Borghese, sister of Napoleon, who occupied the building under the Empire and lavishly added to the decoration of the fine and lofty rooms in the rich but severe style of that epoch. A more personal souvenir of her sojourn remains in the beautiful Empire furniture, decorated with finely chiselled bronze, which filled her bed-chamber, and was purchased by the British Government with the house and property in 1816. This furniture and bronze is being restored by specialists in the chiselled bronze of that epoch. The decoration also underwent some modification and additions under Louis Philippe, when the fine ball-room was richly redecorated. All the drawing-rooms of the ground and first-floor suites look out over the beautiful garden, which extends as far as the Champs-Élysées. The new decoration of the fine *escalier d'honneur* is in an appropriately severe Louis XIV. style, with large moulded stone wall-panels, relieved by many high marble pilasters. The fine old Louis XIV. wrought-iron balustrade has been repaired and regilt. A convenient lift has been installed near the grand staircase for access to the first and second floors on a hydraulic principle controlled by compressed air. The electric lighting has been improved and added to, and some new lanterns and electroliers of suitable style added to the old and valuable ones existing. The sanitary arrangements have been entirely overhauled and renovated, and the kitchen and servants' annexe on the courtyard and street front improved and connected more conveniently with the main building. The private dining-room, which is being decorated with carved oak panels of Louis XIV. style, forming a suitable framework for several large old tapestries by Leynier, after Teniers, which have been carefully restored by the Manufacture des Gobelins, will form an interesting feature of the first-floor suite and a charming change from the severe white and gold or silk-hung walls of the reception-rooms. The British Embassy when complete will be one of the finest of foreign embassy houses at Paris. The present work will cost about 23,000*l*.

Jewish Architects.—The list of Jewish architects who have designed synagogues and other communal institutions, taken from the *Jewish Chronicle*, did not include the name of Mr. Percy L. Marks, as he does not come within this category. But Mr. Marks holds high position as an architect, both from the practising and the literary standpoint. His contributions to architectural literature are well known and appreciated. Recently there has been issued a second edition of Mr. Marks's work, "The Principles of Planning," the first edition of which was sold out in what may be considered as record time for a book of its class.

NOTES AND COMMENTS.

THE thirty-third annual meeting of the London Master Builders' Association was held under the presidency of Mr. JAMES CARMICHAEL. The report of the executive council, the accounts and balance-sheet for the past year were adopted. The general meeting gave instructions and powers to the Council to confer with the trade unions with a view to improve the present working hours arrangements. A warm vote of thanks was given to Mr. J. CARMICHAEL for the able and successful manner in which he discharged his presidential duties during the past year. The following officers were elected:—President, Mr. FREDK. HIGGS (Messrs. F. & H. F. HIGGS); senior vice-president, Mr. J. W. LORDEN (Messrs. W. H. LORDEN & SON); junior vice-president, Mr. WM. HIGGS (Messrs. HIGGS & HILL, LTD.); treasurer, Mr. F. L. DOVE (Messrs. DOVE BROTHERS); hon. auditor, Mr. A. B. H. COLLS (Messrs. COLLS & SONS). Executive Council.—The following were re-elected:—Messrs. C. ANSELL, G. APPLETON, F. S. BYWATERS, G. BIRD GODSON, F. MAITLAND MAY, HOWELL J. WILLIAMS, L.C.C., A. W. TURNBULL. The following were elected:—Messrs. F. P. RIDER, F. RUDDLE, H. J. SHELBOURNE.

OUT of England there is no part of the world in which SHAKESPEARE'S works secure so much attention as in Germany. Plays which are never produced on the English stage are performed in the theatres, and it is sometimes possible in the course of a week to see half a dozen of them in one of the great cities. There are several translations, and so great is the popularity the publishers have found it advantageous to bring out editions which cost not more than one penny a play. Indeed, it might be inferred after reading the books of some of the commentators that SHAKESPEARE was a German who accidentally was born in an English town. Owing to the general interest in him it is easy to understand the indignation which now prevails at Weimar because of an insult to his memory. Last year a Shakespeare Memorial was erected in that cultured little capital, where the plays were often performed under the direction of GOETHE and SCHILLER. A few days back a miscreant threw black acid on the work which quickly disfigured it. The authorities have offered a reward for his detection. Some suppose the act was done as a testimony to the belief that the memorial was unworthy of SHAKESPEARE. But condemnation could easily be expressed in another way.

THEODOR MOMMSEN, the historian, died in 1903, and there was no man of the nineteenth century who was better acquainted with ancient Rome and its institutions. He was a man of great independence, and at one time lost his professorship on account of his political opinions. But it would be very difficult to assign his position among the German parties. It has at length been decided that about 3,000*l.* is to be expended upon a statue of MOMMSEN, which is to be placed in the garden of Berlin University. The committee have arranged that the great scholar is to be represented as seated, and that no subordinate allegoric figures are to be introduced. It has been decided that seven of the most prominent German sculptors are to be invited to take part in the competition. Each of them will receive a fee of 1,800 marks. The height of the figure as modelled will be half a metre apart from the pedestal. The models are to be sent in by July 1. No special jury will be appointed, as the committee consider they are capable of selecting the most eligible model.

IRELAND is commonly supposed to have a more abundant rainfall than either England or Scotland. The reservoir at Roundwood, which contains the supply on which Dublin depends, is, however, found to be between 2 and 3 feet below the average depth; that indicates a water famine unless there is a long period

of constant rain. Rathmines, a suburb of Dublin, which at one time was expected to rely on the city for its supply, contrived to obtain possession of an independent source, and in a similar emergency offered a copious supply of pure filtered water. But it was proved that the generosity could not be long continued. At the present time, therefore, Dublin is without a neighbor that could help. It is said that the reservoir in December last contained 600,000,000 gallons less than at the present time, but owing to a bounteous fall of rain the difficulty was got over. The Corporation acquired 500 acres of land to enable a new reservoir to be constructed, but the city was not in a condition to undertake an expense of about 70,000*l.* Whatever the cost, the work will now have to be entered upon.

ILLUSTRATIONS.

WESTMINSTER CATHEDRAL.—ALTAR IN CHAPEL OF SS. GREGORY AND AUGUSTINE.

MOUNT STUART, ISLE OF BUTE, N.B.—THE CHAPEL, WEST END.
NEW CENTRAL HALL PREMISES, DONCASTER.

ST. PETER'S CHURCH, HORNSEY.

THE first portion of this church, consisting of nave and aisles, was erected in 1897 at a cost of about 6,000*l.* The work now in hand comprises the chancel, chapel, organ chamber and vestries. It has been found necessary in this portion of the work to modify the original design to a considerable extent so that the funds available should not be exceeded. The church when completed will accommodate 900. The walls are of red brick with dressings of Ancaster stone outside. In the interior the masonry is of Monk's Park stone. The roofs are covered with small green slates. The cost of the present work is 4,000*l.* The contractor is Mr. W. PARMENTER, of Braintree. The architects are Messrs. JAS. BROOKS, SON & GODSELL.

A CORNER IN LISIEUX.

ALTHOUGH much modernised, Lisieux still retains many of those quaint old half-timbered houses which seem to threaten to tumble on your head at every moment, and yet are likely to add a century or two more to an existence which has already lasted several hundred years. These houses were put together at a time when the speculating builder was as yet of unknown power, or at any rate when the men could devote more time and care to the selection of materials and to construction, unhampered by social and sanitary laws as we understand them. Much there is in the half-timbered houses of Normandy which we may consider somewhat rude, especially as regards the figure subjects; but however ill-proportioned and coarse the figures may be when seen near, at a little distance they are effective, and moreover greatly redeemed by the excellent carving of architectural forms. The subject of the accompanying sketch Mr. HAIG has been somewhat altered from time to time, and retains here and there some ornamental features, but is in this respect much behind some other houses in the town, especially one in the Rue aux Fèvres and some others—so much worn, however, that it requires close scrutiny to become aware of the almost complete covering of the timberwork with ornament which a hundred years ago must have given a very rich appearance to these houses. Lisieux is especially rich in good dormer windows of bold projection, so that the skyline of almost every street or view of houses is anything but tame. It is a tempting place for both painter and architect.

CHATEAU D'AZAY-LE-RIDEAU, INDRE-ET-LOIRE.

WE publish this week one view of the chateau attached to the small town of Azay-le-Rideau which is considered to be one of the most characteristic examples of its class in France. It dates from the time of FRANCIS I., and was erected for GILLES BERTHELOT. The sculpture is supposed to have been executed by JEAN GOUJON. The river Indre almost surrounds the chateau.

BRITISH ART AT THE ST. LOUIS EXHIBITION.*

THE walls of the United States Galleries were decorated with red or pale green jute, while the friezes by Charles S. Holloway, representing seated female figures with garlands of flowers containing the names of the prominent American artists, harmonised with the decoration of the walls.

The French Section contained the largest collection of pictures and sculpture that has ever been sent from that country, and was fairly representative, although it appeared that many of the most distinguished artists were not represented by their best works.

The scheme of colouring dominating their section was a neutral red, and the frieze was from a design by Besnard, consisted of a conventional figure closely repeated; the colours employed being a deep golden brown, blues and red.

The large space allotted to Germany was chiefly occupied with enormous historical canvases from the public galleries that had been painted by Imperial order. They are said to have been interesting historically, but from the artistic standpoint of less importance than many works that might have been included with greater advantage.

The chief gallery assigned to German art exhibits, as in Paris, was decorated with a somewhat monumental treatment of the walls, but the general effect is said to have been dignified and serious.

Holland sent a good collection of works by her best artists, and the decoration of her section was made up of broken greens and greys, with a frieze in which dull purple and dark green harmonised well with the walls.

The scheme of colouring in the rooms of the Belgian section was of russet and gold, and in their frieze the names of the great masters of the Flemish school were introduced. Belgium's art exhibit, I understand, was stronger in sculpture than in painting.

The Italian Section was again disappointing. It is unfortunate that Italy has failed to make a favourable impression in modern art at recent international exhibitions. The decoration of their walls and their frieze, however, were good and original, and were embroidered in harmonious colours.

Japan had a large exhibit of noted examples of their old school of art, as well as paintings by younger artists in the European style. She also sent a large collection of sculpture in ivory, wood and bronze which greatly enhanced the success of her section. The decoration of the Japanese rooms consisted of a general scheme of colours of positive reds, green and blue predominating, and the frieze was by Japanese artists, who worked it direct on to the walls.

And now I will ask you to accompany me through our galleries, following them in their order on the plan. The first room approached from the German Section is No. 70, which was devoted exclusively to black-and-white work—drawings in pen, pencil and chalk, etchings and engravings, many I fear to show to advantage in the limited space; we were anxious to have the collection as complete as possible, and few, if any, of our most important men were absent. Not only were our etchings both good and representative, but we had no reason to be ashamed of the examples of our characteristically English art of mezzotint played. Here we were able to show upwards of twenty fine drawings by Burne-Jones, a dozen by Leighton, several by Sir Seymour Haden, and ninety other eminent artists exhibited in this section.

Room 71 is the first of those devoted to oil-paintings. In the centre is Orchardson's portrait of "Sir David Watt, late Provost of Aberdeen." Without in any way diminishing the work, I ought to tell you that this superb picture produced an immense impression at St. Louis. On the right are:—(1) "The Pilot," by Napier Hemy, A.R.A.; (2) "The Portrait of Professor Kennedy," by Hugh Hemy; and (3) "Evening's Twilight," by J. E. Grace, A.R.A. Above is John Lorimer's "Idyll Autumn." On the left—(1) "Wet Sands," by William McTaggart, R.S.A.; (2) "Portrait of Admiral Fisher," by A. S. Cope, A.R.A.; (3) Ernest Parton's "In the Tangled Wild Wood." Above is Fred Appleyard's "Easter Time." The room contained many other well-known pictures—"Brown and Blue," by Alfred Parsons, A.R.A. The picture was painted on the upper Thames above the point where its junction with the Severn Canal makes the river navigable

From the paper by Mr. Isidore Spielmann, F.S.A., read at the Society of Arts on March 1.

for barges. "God rest ye, merry gentlemen," by Seymour Lucas, R.A., one of those delightful Christmas carols of the seventeenth century; "Portrait of Mrs. Reynolds and Daughter," by Luke Fildes, R.A.; "The Flowing Tide," by Moffat Lindner, N.E.A.C.; "The Storm," by Julius Olsson; "The Fracture," by William Orpen, N.E.A.C. A point of great interest in this picture is that the room represented is that in which Thackeray lived in Soho and wrote "The Newcomes." The artist's intention is an exercise in the rendering of light. "La Belle Dame sans Merci," by Frank Dicksee, R.A. The idea is taken from Keats's ballad, and depicts the passage:—

I set her on my pacing steed,
And nothing else saw all day long,
For sidelong would she bend and sing
A faery's song.

La Belle Dame, in a gown of rose-colour and silver; her red floating hair shadows the knight as she bends over him. He is held by the magic of her thrall; an ecstasy of wonder and devotion possesses him. Under this spell he is taken to her grotto to be lulled asleep, to dream dreams and to meet the fate awaiting him.

Room 72 contained a large number of important works, many by Scottish artists. In the centre was Sir John Millais's "Chill October," one of his best-known and finest works, lent by Lord Armstrong, which you will see again presently; above it, "On the Threshold," by Ernest Normand. On the right—(1) Millais's "Portrait of Cardinal Newman;" (2) the President's picture, "The Catapult;" (3) "The Lilypond," by G. D. Leslie, R.A.; (4) "Scene from Enoch Arden," by J. Sant, R.A. On the left—(1) Sir John Millais's "Portrait of Sir James Paget;" (2) the President's "Greek Dance;" (3) a sea-piece by J. C. Hook, R.A. In this room were also Lord Leighton's "Perseus and Pegasus with the head of Medusa;" "Portrait of Cardinal Manning," by W. Oules, R.A.; "The Dream of Launcelot," by Burne-Jones; "Portrait of Lord Charles Beresford," by Charles Furse, A.R.A.; and pictures by Peter Graham, R.A.; W. F. Yeames, R.A.; Briton Riviere, R.A.; the late Val Prinsep, R.A.; Ogilvie Reid, R.S.A.; Byam Shaw, and T. B. Kennington; and the "Portrait of Sir Walter Gilbey" and "The Borgia," by W. Q. Orchardson, R.A.

"Chill October," by the late Sir J. E. Millais, R.A. Pasted on the stretcher at the back of this picture is a sheet of paper, on which the painter has written the following note:—

"Chill October' was painted from a back-water of the Tay just below Kinfauns, near Perth. The scene, simple as it is, had impressed me years before I painted it. The traveller between Perth and Dundee passes the spot where I stood. Danger on either side—the tide which once carried away my platform and the trains which threatened to blow my work into the river. I chose the subject for the sentiment it always conveyed to my mind, and I am happy to think that the transcript touched the public in a like manner, although many of my friends at the time were at a loss to understand what I saw to paint in such a scene. I made no sketch for it, but painted every touch from nature, on the canvas itself, under irritating trials of wind and rain."

"Fantasie en Folie," by Robert Brough, A.R.S.A., the able young artist whose life was so sadly cut off by the terrible accident which recently occurred on the Midland Railway. This picture attracted great attention when it was exhibited at the Royal Academy, and still more at St. Louis. It represents a lady in black, seated in profile, contemplating a Chinese idol.

"The Portrait of J. C. Hook, R.A.," by Sir John Millais, is generally considered, with the possible exception of his "Sir Gilbert Greenall," the finest and most brilliant portrait he ever painted of a man.

One can hardly look at a fine portrait like this without recalling Ruskin's famous saying that, "The highest thing that art can do is to set before you the true image of the presence of a noble human being. It has never done more than this and it might not do less."

"The Avenue," by D. Y. Cameron. This picture was greatly appreciated at St. Louis, quite as much as at the Brussels Exhibition, and was considered a good typical example of the Scottish school. The prevailing notes of colour are rich olive, brown, gold and rose.

"The Auld House," by J. Macaulay Stevenson, is a picture which in feeling, of course, reminds one of Corot. The house is really a very inconsiderable item. The lake and its reflections of trees with undergrowth and atmosphere charged with moisture are characteristic of the painter's work.

"Portrait of W. W. Robertson, Esq., Master of the Merchant Company of Edinburgh," is considered an excellent specimen of the work of Sir George Reid, late president of the Royal Scottish Academy. Sir George also sent a "Portrait of Tom Morris," the celebrated golfer.

"The Borgia," by W. Q. Orchardson, R.A. Cæsar Borgia is best remembered for the remorselessness with which he rid himself of those who stood in his way. He generally did so by inviting his intended victim to a banquet, at which he would challenge him to drink wine, served to the doomed man in a poisoned cup, the other guests stealing away, for "to drink with the Borgia" was an honour which became synonymous with death. Mr. Orchardson's other works at St. Louis were his portraits of Sir Walter Gilbey and Sir David Stewart.

In Room 72, "The Image Finder," bronze statue by W. R. Colton, A.R.A. A work of much originality and strength and interesting in motive.

"A Wounded Leopard"—in bronze, by J. M. Swan, A.R.A. This bronze is a fine specimen of casting by the *cire perdue* process. It represents an East African leopard pierced through the shoulder and fore-arm by an arrow; the head of the arrow is bitten off and fallen, and the animal is biting and tearing at the remainder. It is a life-size work about 3 feet square at base and 3 feet high, and was begun and executed for Mr. George Jay Gould, of New York, by whom it was lent. The finished bronze has never been exhibited here, only an early sketch of the work in plaster.

Room 73 contained Mouat Loudon's "Alas! that Spring should vanish with the Rose;" David Murray's "Braes of Yarrow;" J. Young Hunter's "Forest Lovers;" Sir Wyke Bayliss's "The Sanctuary in the Certosa, Pavia;" Leighton's "Clytemnestra;" W. Hatherell's "River Picnic;" Perugini's "The World Forgetting."

On the opposite walls were, amongst others, Solomon J. Solomon's "Portrait of Mr. J. H. Levy;" Marcus Stone's "Soldier's Return;" John Collier's "Prodigal Daughter;" Arthur Hacker's "Leaf Drift;" and H. von Herkomer's well-known and widely exhibited picture, "Makers of My House," which represents his father and his two uncles. "The Doll's House," by William Rothenstein, N.E.A.C. When I asked the artist to describe this picture he replied that he had wanted to paint a man and a woman suggesting something of a mystery which underlies all life, and something of the dramatic possibilities of every situation. The title was only thought of when the picture was first exhibited in Paris. It was suggested partly by the room and partly because there seemed to be something akin to the lack of finality in Ibsen's semi-tragic plays. The only pieces of sculpture in this room were "Robert Burns," a statuette, by W. Hampton, and "Cock and Snake," bronze group, by J. H. Furse.

In Room 74 was Leighton's "Perseus and Andromeda;" Henry Moore, R.A., the greatest marine painter of his day, "Storm Brewing" and "St. Alban's Race;" Arthur Nowell's "Portraits of his Sons;" "The Sawing Horse" and "Tucking the Rick," by H. H. La Thangue, A.R.A.; J. E. Christie's "Pied Piper of Hamelin;" "The Duck Pond," by Fred Hall.

In the same room were "Washing the Beggars' Feet," by Sir James Linton, R.I., and works by Edward Stott and George Haité, and three by Sir Laurence Alma-Tadema, R.A. The well-known "Shrine of Venus" is one of the three Sir Laurence sent to St. Louis. It represents a hair-dresser's shop, classically imagined. The shop is in the middle plane, through which the clients have to pass. On entering the inner room they deposit a small offering, lay the usual marigold or a rose on the table before the shrine, in which is a statue of Venus. This picture now finds a home in America, where so many works by this artist now are. It changed hands during the Exhibition. "The Rainbow," by P. Wilson Steer, N.E.A.C., was painted at Bridgnorth, near the town through which the river Severn flows. It was the object of the artist, like so often that of Constable, to give the sparkle on foliage while a shower is falling, the effect being late afternoon towards autumn. "Cave of the Storm Nymphs," by Sir E. J. Poynter, P.R.A. The picture is intended to suggest the indifference of nature to destruction, and the worthlessness of the prizes of life in the face of the elements. In the presence of the artist it could hardly be becoming in me to dilate upon its beauties. "The Quartette," by the late Albert Moore, one of the most charming of that artist's works. It is quite remarkable for the grace of its artistic drapery and its exquisite colouring.

"Hylas and the Nymphs," by J. W. Waterhouse, R.A. The story, you will recollect, is that Hylas, a Greek youth who was sent to fetch water from a certain pond situated

amongst some hills, was carried down by the water nymphs. This is one of Mr. Waterhouse's best pictures, and was kindly lent by the Corporation of Manchester. "The Ricard Yard," by George Clausen, A.R.A., was also in this room, but this picture, like so many others, would not photograph well.

In Room 75 the centres were occupied by—(1) "The End of a Glorious Reign: the Funeral of Queen Victoria," by John Charlton; (2) "The Homage-giving, Westminster Abbey: Coronation of Edward VII.," by J. H. Bacon, A.R.A.; (3) "Washington's Farewell to the Army," by A. C. Gow, R.A. We also had in this room:—"The Dressing Room," by Mrs. Stanhope Forbes, A.R.W.S.; "Bolton Abbey," by David Murray, R.A.; "Alpine Scenery," by J. MacWhirter, R.A.; "A Sea Maiden," by Herbert Draper, R.A.; and "Warkworth Castle," by Sir Ernest Waterlow, R.A., the ancient stronghold of the Percys in Northumberland. It is picturesquely situated two miles from the sea, and was painted in Sir Ernest's happiest and most dignified manner.

Room 76.—Here we had "Shrimpers," by R. McGregor, R.S.A.; "A Highland Solitude," by A. K. Brown, A.R.S.A.; "Portrait of Tom Morris, the Golf Player," by Sir George Reid, R.S.A.; "Drowsie Cronies," by R. Alexander, R.S.A.; "In the Highlands," by Peter Graham, R.A.; "Serenade," by T. B. Kennington; "Across the Snow they Travel," by Joseph Farquharson, A.R.A. On the other wall, "British Wild Cattle," by H. W. B. Davis, R.A., and a "Portrait of Mrs. Denny," by W. W. Oules, R.A. I regret that a few of these and many others besides did not photograph sufficiently well to allow of slides being made of them.

"Boulter's Lock," by E. J. Gregory, R.A. This picture represents the most characteristically crowded part of the Londoner's playground. The time is about 5 o'clock on a Sunday afternoon, rather late in the season, when the dew is on the grass, and the lock with its struggling occupants is full to the brim with shadow, but still girt by a sunlit landscape, into which the children strive to emerge. The artist is himself afloat, in two different boats. When this picture was shown at the Brussels Exhibition, there was, in the French Section, another rendering of the same subject; it was curious to compare Mr. Gregory's version seemed to wipe the Frenchman's of artistic existence.

Room 76.—"King Edward I.," bronze equestrian statue by Hamo Thornycroft, R.A. It represents the great monarch and law-giver mounted on horseback, with a Plantagenet shield slung at his back, and holding in his right hand the famous statute of Winchester. This was originally designed for the great competition for the decoration of Blackfriars Bridge twenty years ago. Having got this fine model from Mr. Thornycroft, the sewers committee of the City of London took fright and decided not to venture any further action—beyond the consideration of its sewers. At least nothing has since been done.

"Castles in the Air," a statuette and pedestal in marble and inlays, by W. Reynold-Stephens. This is an attempt to embody a child's profound realisation of a wonder-story. A little girl of about two years leans back in a chair of enchantment, which stands upon a pedestal, the design of which is based upon fairy-castle forms. Flowers and fancy decorate the chair, which is capped by a woman's castle in mother of pearl.

Here in Room 77 we had "Surrey's Pleasant Hills," by B. W. Leader, R.A.; "The Return from the Ride," by the late Charles Furse, A.R.A., N.E.A.C. The portraits are by Mr. and Mrs. Aubrey Waterhouse—then Miss Lena Gordon. This was one of the most noted pictures in the Royal Academy in 1903, and was praised by all the critics as being finely designed, ably drawn, good and original in colour, and altogether a strong and remarkable achievement. Unhappily, as you know, Charles Furse died last year. "Shrimpers off the Coast of Brittany," by R. McGregor, R.S.A. The exquisite golden tone of the sunburnt faces and hands against the silvery grey of the sea and sky was the artist's chief motive in painting this picture. On the opposite wall were:—"Portrait of Lady Hickman," by A. Cope, A.R.A.; John R. Reid's "Rival Grandfathers," an old picture; the late M. Ridley Corbet's "Sunrise."

"The Cider Press," by Frank Brangwyn, A.R.A. which we have one of those compositions, founded apparently on a simple natural scene, which yet contains so much more than we ever realise at one time. Though the "Cider Press" gives the title to the picture, we feel that the artist's mind has been occupied with the enduring conditions of natural human labour, perhaps even more with the perennial beauty of sunlight, and, above all, of noble design.

"Venus and Anchises," by Sir William Richmond, R.A., deals with a theme as old as human nature—the association of love with the renewed life in springtime: This is one of Sir William's most successful pictures, and was lent by the Walker Art Gallery at Liverpool.

"The Edge of the Somme," by Alfred East, A.R.A., is a decorative picture. Its colour scheme consists of a series of yellow greys and ivory white. The sentiment it expresses is the quiet of an early morning. It was painted in London from sketches and studies made in the beautiful valley of Flanders. In the immediate foreground, the cool white colour of the swans forms a pleasing note in relation to the warm white of the sky.

Room 80.—This room was devoted to small oil-paintings and to water-colour drawings, but they are on too small a scale for you to see much of them. Here were "The Javelin," bronze statue by W. R. Colton, A.R.A., representing a girl playing with the water that trickles over the rock. It attracted great admiration among the visitors. "The Habit does not Make the Monk," a small oil-painting by the late G. F. Watts, R.A., is one of that playful character which Mr. Watts affected more and more as age came on him. The "May Morning on Magdalen Tower, Oxford," by W. Holman Hunt, is the finished study for the large picture. On the 1st of May at sunrise, for many generations, the choristers of St. Mary Magdalen College, Oxford, ascend with a band of music to the top of the tower belonging to their seminary and sing the Hymnus Eucharisticus. "St. Theophilus and the Angel" is an important water-colour by the late Sir E. Burne-Jones. After the death of Dorothea, as St. Theophilus was returning to the courts of Law, there met him on the threshold an angel bringing a basket of fruit and flowers, who, saying, "My dear Dorothea sends these to thee from the place where she now is," vanished. Theophilus, pondering all this, came at last to the true belief, and in it died. "The Princess's Tale," also by Sir E. Burne-Jones. This, as you will remember, was the last work completed by the artist.

We now come to the water-colours. To them Room 81 is devoted exclusively. This collection came under close observation and criticism, in view of our claim that water-colour painting is our national art. "The Battle of the Standard," by the late Sir John Gilbert, P.R.W.S., so-called the remarkable standard which was set up by the English at Northallerton during the war between King Stephen and King David I. of Scotland in 1138, an exceedingly powerful drawing. "Cumberland Moors," by the late John Collier, R.I., is an excellent example of his admirable work. Tom Collier was essentially a water-colour painter of the first rank, and by his untimely death in 1891 English landscape art lost an artist whose work rivalled that of J. M. W. Turner in quality. "The Battle of Flowers," by R. B. Bell, R.W.S., shows a silvery grey hall, in which a furious battle is going on between two parties of girls in flowing garments. Everything is in movement, for movement is the *motif* of the drawing, the wide loose masses swirling out from the girls, or here and there pressed close to their form, as the action varies. In "Andromeda," by Arthur Rackham, A.R.W.S., the subject chosen is a moment when the great sea-monster is approaching to devour his victim. He is grey-scaled and slimy like a fish, with webbed feet, and comes from the gloom of a cavern, crawling over the rock at the foot of which is Andromeda chained. The colour is rather grey and subdued; the drawing of the monster, wonderful. Mr. Rackham is a specialist in dragons. "Melisande," by Mrs. Adrian Stokes. Melisande is seated on a rock in a weird forest, gazing dreamily in the water where her crown lies. The story does not tell what crown it is, or where Melisande came from, but she hates the crown and does not wish ever to wear it again. There is no other note in the picture than black or white. "The Thorny Path of Knowledge," by Walter West, R.W.S.—a dainty little picture of a Quaker mother teaching her child to read—is a small work by one of the most brilliant of the younger associates of the R.W.S. "A Valkyrie," by Edward R. Hughes, R.W.S. This Valkyrie leaves her Valhalla, is soaring above a city formerly the scene of peace and heroism, but now at rest from warfare and sleep in the moonlight. The artist intends her to seem passing into the depths from the back of her winged horse, as though she had a great longing to live with the gods in their beautiful city, through whose heart flows a life-giving river. Sir Francis Powell, P.R.S.W., Fulleylove, R.I., the late Charles Green, R.I., Dudley, R.I., and Yeend King, V.P.R.I., as well as the presi-

dents of the water-colour societies, were all represented in this room.

The sculpture exhibited here included:—"Hymn to Demeter," in bronze, by Horace Montford, representing a girl marching in procession as she sings her hymn. She fits her steps to the music, the measure ever varying, her body bending and swaying to the same rhythm. "Love and the Mermaid," a bronze group by Charles J. Allen, is supposed to represent Cupid, love-god of the earth and air, who has wandered on to an outlying ledge of rock, and encountered a rival power in the witchery and charms of a Mermaid instinct with love and the sea. He stands bewildered and fascinated, and likely to fall a half-willing prey to the wiles of the fair captor. "Boy with Top," a bronze by E. Roscoe Mullins, is a fine rendering of nature.

Gallery J and K was devoted to architecture. Here 200 works represented seventy of our leading architects. It is impossible to read so long a list of names, but I think I can safely say that very few eminent men in that profession were unrepresented. British architecture, as is universally admitted, has made great headway of late, and the carefully selected works sent to America for this section must have convinced the public that we have able architects as well as painters and sculptors.

Room 79 connected the Fine Art with the Arts and Crafts Section, which you see through the columns. The pictures here:—"The Brook," by Leslie Thomson, R.I.; "Saving the Colours by the Guards at Inkermann," by Robert Gibb, R.S.A.

Room 79A.—The main collection of sculpture, although small, was representative, only one or two eminent sculptors being absent. Many of the busts and groups were placed round the walls of Gallery 79, where they showed to great advantage and added largely to the general effect. Some of the smaller bronzes, as you have seen, were grouped upon pedestals in Gallery 72 and round the Water-colour Gallery 81.

The short passage leading from Gallery 79 to Galleries 73 and 75 was well lighted from the side, and afforded good positions for a few bas-reliefs. The following were among the chief sculpture exhibits:—"Eve," a bronze statuette by Thomas Brock, R.A., represents the Universal Mother standing with her head bent forward, her left hand on her breast and her long hair falling down her back and over her shoulders; the serpent coils round the base, which is circular in general form on a square plinth. "The Sluggard," a masterpiece, if not the masterpiece, in sculpture by the late Lord Leighton is too well known and appreciated to need praise. The sluggard presses a laurel wreath under the heel of his right foot, a touch of morality, unlike Leighton's usual practice, being introduced. "Teucer," in bronze, by Hamo Thornycroft, R.A., was, you will remember, the Homeric bowman famous at the Siege of Troy. "The Kiss," by A. G. Walker, is a work which was carved direct in the marble; no preliminary clay model having been made, but merely a shaded drawing on the marble slab. "Snowdrift," by the late E. Onslow Ford, R.A., is a recumbent female nude figure in white marble on a plinth of Mexican onyx. This charming statue is one of the artist's last works, and was exhibited in the Royal Academy in 1902. It is about 4 feet long. "Mother and Child," the beautiful bronze bust by George Frampton, R.A., includes the portraits of Mrs. Frampton and the artist's son; the group is life-size. "The Spirit of Contemplation," a life-size bronze figure of a girl reclining in a neo-classic seat decorated with small figures of Courage, Philosophy, Life, Love, and the like. The work is by Albert Toft. "Psyche," bronze ideal head, by F. Lynn Jenkins. In it the sculptor, who is perhaps best known as a decorative worker, has aimed not merely at reproducing beautiful form from nature, but also at expressing the less tangible beauty of the soul underlying. "Age of Innocence," bronze bust by Alfred Drury, A.R.A. An ideal bust of a child, in which the sculptor endeavoured to portray the innocence, simplicity and *naïveté*, and, above all, the young flesh of childhood. "The Breton Peasant," by Professor Lanteri. The original of this bust in bronze is at the Musée de Luxembourg, and also at the Tate Gallery (each claims to have it). It was modelled as a practical demonstration before some French sculpture students in the North of France. "The Last Song," by H. Pegram, A.R.A. The idea is that of an old soldier dying, to whom a maiden comes and sings of his past deeds and future reward.

Room 83, with the two small rooms, 78 and 82, contained our arts and crafts exhibits, or, as the Americans termed them, original objects of art workmanship. For the

first time in the history of international exhibitions these were shown on a large scale side by side with the fine arts. A similar course was attempted at Chicago, but the response was then but meagre. Our American friends decided that at St. Louis the line which has hitherto separated applied art from the fine arts should be obliterated, and that, under the broader classification, any work, whether on canvas or in marble, plaster, wood, metal, glass, or in textiles, is equally deserving of recognition from the standpoint of conception and technique. The unity of art, therefore, which lay at the root of William Morris's teaching, was fully recognised at St. Louis. As you are probably aware, these artists, or groups of artists, work co-operatively, and both design and execute the works they produce. The United States exhibited nearly 1,000 original objects of art workmanship. Great Britain came next with over 400—the largest collection of its kind we have ever contributed to any exhibition. France followed with nearly 200 objects, and the other countries were far behind. In the selection of their exhibits, the arts and crafts sub-committee, presided over by Mr. Walter Crane, R.W.S., had a completely free hand, and Mr. Halsey Ricardo went to St. Louis to arrange them.

Room 83A.—Testimony should here be borne to the very great beauty of the bookbindings that were sent, besides the artistic pottery, dainty and elegant glass, refined jewellery, brilliant enamels and illuminations, which completed this interesting collection, and I am only sorry that time does not permit of my selecting individual objects for your closer inspection.

These were some of the chief features of this display of British art which has now been dispersed; but I must repeat that amongst the remainder were numerous works of equal interest. Some of them I hope to include in the illustrated souvenir which I am preparing for the Royal Commission.

It is a matter of some interest that our section was the first to be dismantled and packed up, and that we were the first to get away. In this we were not assisted by the United States Customs and other administrations, and we found that it is even more difficult to get things out of the country than into it. They evidently parted with us with great reluctance.

The United States duty upon paintings in oil and water-colour is 20 per cent. *ad valorem*, upon black-and-white drawings it is 25 per cent. *ad valorem*, whilst the duty upon pictures imported into the United States from France, Germany, Italy, &c., is but 15 per cent. It is difficult to suggest a reason for this preferential tariff in favour of non-British countries, but the cause is probably to be sought in the fact that they are able to offer some corresponding advantage to the United States. The artists of Great Britain are selected as the victims—though not the only victims of the open door which Great Britain throws wide to all comers—and they are consequently compelled to pay considerably higher duty than their foreign rivals. The duty upon bronzes is 45 per cent. A picture, as I have said, has to pay 20 per cent. of its value, but the duty upon its frame is 35 per cent. of its value, and 45 per cent. if covered with gold leaf. The duty upon groups made from composite materials may be anything from 20 per cent. to 60 per cent., according to the predominating material of which it is composed, and this is left to the Customs' officials to determine. All these are restrictions to business, but it is nevertheless gratifying to note that the sales from the British Art Section were considerably larger than those effected in any other foreign section. This, no doubt, was entirely due to the excellence of our section, and had it not been for the heavy duty a larger number of sales might have been completed. It is to be hoped that the claims of British artists to fair treatment will not be overlooked, if, as is alleged, modifications in the United States tariff are now in contemplation.

With reference to sales, there is something I would like to say with respect to the amounts which some of our artists ask for their works in comparison with those asked by artists competing in the other sections. From my experience gained at several international exhibitions, I cannot help thinking that many of them stand in their own light by fixing prices which are unlikely to encourage purchasers. Foreign artists of the first rank fix the values of their pictures at these exhibitions at prices which more readily command sales. Their failure at St. Louis is quite an exceptional experience for them. Following the example of France we also withheld our art section from competition for awards, and in this decision we had the hearty support of the arts and crafts committee. I may add that other

sections of the Royal Commission, notably the education section, also withheld their exhibits from competition.

A loss to the British art section was the absence of the works of many eminent artists who were prevented from exhibiting with this country by virtue of their American nationality, and many of them sent their works to the American Section. The list includes John S. Sargeant, R.A.; E. A. Abbey, R.A.; the late G. H. Boughton, R.A.; J. J. Shannon, A.R.A.; George Wetherbee, R.S.; McClure Hamilton; Daniel Wehrschmidt; Mark Fisher; F. Derwent Wood; W. J. Hennessey; and F. D. Miller.

The question is often asked whether these vast international exhibitions can really be successful, and whether the results they achieve are commensurate with the expenditure of time and money which they entail, and whether they are even appreciated as they should be. Those who ask whether the St. Louis Exhibition has been successful I would reply that you cannot gauge the success of any exhibition merely by the amount of money taken at the turnstiles. Its success can only be measured later, at all. The new reputations made, the number of orders booked, the fresh business opened up, the money brought into the country, and, above all, the new seed that has been sown, and the lessons that have been taught and learnt, these are factors that have to be taken into account.

There are many reasons why British artists should participate in these international exhibitions, quite apart from the question of the sale of their works. International exhibitions are international competitions. It is a matter of country *versus* country. The success of any one section adds prestige to the country it represents, and this is every patriotic Englishman should endeavour to assist in scoring a success at such exhibitions for the honour of the country. Apart from this, the names of artists who elude to be represented are kept alive, whilst those whose names are not to be found in the catalogue place themselves at a disadvantage in the public recollection and in the record of history.

The impression produced by our section was distinctly favourable, and the Press both of this country and of the United States was alike cordial and just in its appreciation of it.

In a still more official manner was our success brought to the notice of the public by the letter of our Ambassador to the United States, Sir Mortimer Durand, who thus wrote to the Foreign Office from Washington on November 18:

"The British Art Section is generally regarded as containing the best collection of pictures in the Exposition."

For this satisfactory result thanks are due to the private owners, societies and provincial corporations who came forward and lent their valuable works for the honour of the nation. The co-operation of our artists must be included in our tribute, for their zeal did much to insure our success.

Our work will have served its purpose if it has raised the prestige of British art abroad and helped to encourage our artists at home.

OPTICAL REFINEMENTS IN MEDIAEVAL BUILDINGS.

THE Museum of the Brooklyn Institute of Arts and Sciences has been invited by the Architects' Society of Rome to make an exhibit in Rome, under the auspices of the Society, of the photographs of Mediaeval architectural refinements which represent the observations of William H. Goodyear, curator of fine arts in the Brooklyn Museum. One hundred and fifty feet of linear hanging space have been assigned for this Roman exhibition, which will open on March 15 and continue until April 15. An invitation has been accepted, and duplicates have accordingly been made of sixty-eight of the large photographs which are on public exhibition in the Brooklyn Museum. The photographs were shipped from Boston on February 1 by the White star steamer *Canopic*. Forty-four of the pictures have a dimension of 2 feet by 3 feet (margins included), and twenty-four have a dimension of 18 by 12 inches.

Forty of the subjects represent Italian Mediaeval cathedrals, including fourteen for St. Mark's at Venice and eight for the Pisa Cathedral. Five subjects represent Eastern Byzantine churches at Constantinople and twenty-two subjects represent French Gothic cathedrals, including one for Notre-Dame at Paris. Fifty-six of the negative originals of these pictures were personally made by Mr. William Goodyear and the remaining twelve were taken under

rection. The exhibit also includes photographs of eight plans and elevations of the Pisa Cathedral in the original form of the cartoons of survey (some 36 inches in length), which were made under Mr. Goodyear's directions in 1895. Aside from an exhibition which was made by the Brooklyn Institute at the Liverpool meeting of the British Science Association in 1896, this will be the first occasion on which photographs of architectural refinements have ever been shown in Europe. The Boston public library made an exhibit last April of the Brooklyn museum series of the French cathedrals.

WORDSWORTH'S HOUSE AT PENRITH.

THE public who care for architecture, and believe that it is the duty of municipal bodies and private people to preserve for the use of future generations as much of local history, will be troubled beyond measure, says a correspondent of the *Manchester Guardian*, to hear that the Urban District Council of Penrith, into whose hands a few months ago there came a rare example of Robert Adam's work, have determined, against all argument, to proceed with the work of destruction, and to replace the interesting façade of Wordsworth's house and its loveliness of proportion with a brand-new elevation which has been prepared for them by their sanitary surveyor and engineer, and which is entirely out of keeping with Robert Adam's architecture. Nothing could well have been more short-sighted. The ratepayers are called upon to pay £100 to destroy hopelessly what was one of the most interesting buildings in their town and of its kind in the county of Cumberland—a building which would have, as years went by, been more and more sought as an example of the work of a master architect. The Urban Council, by a decision of eight votes to five, have not only decided to run in opposition to the wishes of many of the inhabitants of the town, but have virtually gone right in the face of all educated public opinion throughout the land. The city fathers have done this with their eyes open. It was not known a few weeks ago that any attempt would be made to replace the façade of Wordsworth's house, although it was known that it was intended to alter the interior of the building for municipal purposes. As soon, however, as it was found that the contract for alteration included the abolition of the façade, townsmen wrote protesting. The Society for the Protection of Ancient Buildings, the National Trust, and Professor Baldwin Brown, of Edinburgh University, took the matter up, and urged that for the sake of preserving so interesting an example of Robert Adam's work for future ages the Urban Council should pause. It was due that the contract was let, the scaffolding was already on the staircases had been cut down in the interior, and a large portion of the exterior cornice had been removed, but the Council determined to wait pending a conference with a local representative of the National Trust, and after this conference they decided to send the plans to the Society for the Protection of Ancient Buildings, and to ask their advice.

Their advice was lucidly given. They strongly urged that, if possible, all the interior of the house should be retained, but, failing this, they were unanimous in their opinion that the present façade should remain absolutely untouched, with the exception of forming a doorway, and they believed that the architect could retain the whole of the present building with the least possible alteration, and could find no difficulty in adapting it and retaining both the interior stairways.

Meanwhile the people in the town petitioned in the same direction, and Professor Baldwin Brown's letter and letters both from the National Trust and the Society for the Protection of Ancient Buildings were published in the Press. But, deaf to all entreaties, the urban authority by a majority vote determined to proceed, and though they gave a fair name of Penrith for ever in the dust by such an act of vandalism as only Philistia could be glad of, they set to work with a will to improve the work of Robert Adam, the master architect of his century, from off the face of the earth and to replace this invaluable specimen of eighteenth-century architecture by the modern and more pretentious work of their sanitary engineer.

Of course it is only fair to say that it is probable that if the city fathers had known the worth to the town of having a specimen of Robert Adam's work and the distinction that would have accrued to themselves from being able to show on municipal work in a building by him they would

never have attempted so ruthlessly to destroy a work of art in their midst. It is only just to realise that, having blundered into the alteration and let the contracts, they were in a very difficult position. But had they been firm when they found out their mistake, and determined to adapt the interior to their purposes and left the façade alone, they would have earned the congratulations of all thoughtful men of to-day and the thanks of all posterity in their native town.

LADY STAIR'S HOUSE, EDINBURGH.

DOWN one of the closes on the north side of the Lawnmarket of Edinburgh is the old mansion known as Lady Stair's House, which, by permission of the proprietor, Lord Rosebery, is to be occupied by the new University Settlement. Lady Stair, after whom the close is known, was Lord Rosebery's collateral ancestress, Viscountess Primrose, to whom occurred the event recorded in the story of "Aunt Margaret's Mirror," by Sir Walter Scott.

As may be seen from monograms on the entrance door lintel, the house was erected in 1622 by Sir William Gray of Pittendrum and his wife, daughter of Provost Sir John Smith of Groat Hall, an estate about two miles north-west of Edinburgh. The monograms are accompanied by one of the Scripture texts with the quaint spelling so common on old Edinburgh houses—"Feare the Lord, and Depart from Evil."

Some time after the year 1727 four rooms were added to the house by taking in part of a wing in James Court, to the west. It was in James Court that Lord Monboddo lived, and the house to which Boswell welcomed Dr. Johnson on his visit to Edinburgh adjoins two of the four rooms referred to.

In the course of its history the old mansion has been occupied by many people of high degree, but in the beginning of the nineteenth century it was tenanted by a firm of brushmakers, who carried on business in a shop on the north side of the house, which faced a street leading to the Earthen Mound, a thoroughfare begun as an approach to the New Town in 1782.

The door with the inscribed lintel enters on to a turnpike stair, which gives access to three floors above and one floor below, the close sloping down from the house northwards. Two tall windows on the east front light a two-storeyed hall, which has a gallery round two sides of it. A screen separates this hall from an ante-room to the north, which has its windows illustrated by heraldic glass relating to Lord Rosebery's ancestry. The two ancient stone jambs of the large hall mantel were happily *in situ*, and the fireplace has been completed by surrounding them with a stone-hooded lintel.

The house, which has been restored so that it might be a fitting town residence for his Lordship, has, besides the hall and ante-room referred to, a drawing-room and library and eight bedrooms, with the usual accessories of a modern mansion.

Two original narrow stairs which had been destroyed in later years have been reinstated, and three excellent "Adam" mantelpieces replaced after having their accumulated coats of paint removed. One of them is a very fine specimen of solid carved pear or lime-tree wood. Dutch tiles from a Lawnmarket house have been introduced into some of the fireplaces with advantage.

On the east side of the house had been affixed a lead tablet issued by the "Friendly Insurance Society of Edinburgh," established in 1720, and the first Scottish insurance office. It had the number 10 upon it, which must have indicated the policy as the tenth in order of issue. This tablet suggested a device, which has been executed in stone on the south front, of clasped hands uniting the dates of erection and restoration—1622 and 1896. On the east side is a panel with the Rosebery and Stair arms carved thereon.

The architect for the restoration was Mr. G. S. Aitken, Edinburgh.

The Brighton Education Committee have adopted a scheme for the extension and co-ordination of art teaching in the town and more complete organisation on the lines of Birmingham, Leicester and other towns, of the work of the various schools under the control of the education committee. A director of art studies is to be appointed, charged with the supervision of art teaching in the whole of the schools under the education committee, but to keep this position distinct from that of headmaster of the Municipal School of Art.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting was held on Monday last, Mr. T. E. Collcutt, vice-president, being in the chair. The Chairman, having announced that the meeting was convened pursuant to by-law for the purpose of electing the Royal Gold Medallist for the current year, moved, in accordance with notice, that Sir Aston Webb, R.A., be elected for the honour. Whereupon it was resolved, *nem. con.*, that, subject to His Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be awarded this year to Sir Aston Webb, R.A., for his executed works as an architect.

The following candidates were elected:—

As Fellows (16).—Frederick Edward Fellows Bailey, Harold Bailey, William Bevan (Pretoria), Charles Belfield Bone, M.A. Oxon, John Campbell (Wellington, N.Z.), William Edward Vernon Crompton, Charles Burrows Flockton, John Francis Groves, Arthur Jessop Hardwick, Arthur George Leighton, Henry Hill McConnell, Temple Moore, Archibald Neill (Leeds), Edward Turner Powell, William Gilmour Wilson, Edmund Walter Wimperis.

As Associates (31).—Thomas Ford Amery, Douglas Anderson, Edwin George Goodson Bax, William Somerville Beaumont, Martin Shaw Briggs, John Sydney Brocklesby, Charles Fry Callow, Charles Pitwood Carter, George Rowland Ellis, John Alfred Fletcher, Horace Charles Fread, Willie Josiah Freeman, Charles Lovett Gill, Herbert Haylock Golding, Percy Archibald Hinchliffe, Percy Aspden Horrocks, Arthur Benison Hubback, David Barnes Jenkinson, George Alfred Johnson, James Miller, Charles Nicholas, Herbert Luck North, B.A. Cantab, Claude Paterson, Albert Reginald Powys, Edgar Quiggin, Gerald Sanville Salomons, Henry Richard George Strong Smallman, Neil Campbell Smith, Ernest George William Souster, Charles Joseph Thompson, John Norman Randall Vining.

A paper was read on the "Exhibition Building, St. Louis," by Mr. Herbert Phillips Fletcher, of which an abstract will appear next week.

SCOTTISH PARISH CHURCHES.

AN address was recently given by the Rev. Professor Cooper, of Glasgow, to the members of the Edinburgh Architectural Association, entitled "A Minister's Thoughts in regard to the Arrangement and Furnishing of a Scottish Parish Church." Dr. Cooper acknowledged the achievements of other churches, but said he could advise only as to what might be admitted in his own, though he added that the time had come for the National Church to think of more than parish churches, and to consider how to make full use of the restored cathedrals which were being given to her. Adverting to the prospect of a restoration of Kirkwall Cathedral, he said it did not follow that the whole of the large sum of money now happily available for that should be spent at once, and he looked to the Association he had the honour to address to study that venerable minster and then come forward and tell the public, with the emphasis of real knowledge, what was needful to be done and what must on no account be done. Dr. Cooper proceeded to speak of the orientation of churches, the value of the spire, the church porch, the chancel, the side chapel for worship on week days, the vestry and the halls, which, he thought, in these days were receiving rather disproportionate attention. He praised a committee for the building of a new church in a northern town who had told the architects selected to compete for it that what they chiefly wanted was a fine interior. That showed a great advance upon the time, not long past, when it was outside elegance only that was thought of. He proceeded to denounce side galleries and sloping floors, and said that the worst place possible for the organ was the chancel. The danger most to be dreaded was the creating of a notion that the object of church music was not the praise of God but the people's pleasure. This was a thing at all points to be combated, not pandered to. He recommended a return to the pulpit canopy, advised that the chancel should not be too deep, yet spacious and unencumbered, and spoke of what was appropriate to the font and the Holy Table. The lecturer concluded by expressing the hope that the Scottish Universities would soon, like their English sisters at Manchester and Liverpool, be supplied with chairs of architecture, and that side by side with a thorough teaching of the classical orders there would be an exposition of those heaven-born thoughts and longings which were embodied in the sanctuaries of Christian worship.

Mr. Hippolyte J. Blanc, in proposing a vote of thanks to

Dr. Cooper, said he wished to correct a misapprehension which seemed to exist in the mind of the public as to sum that was at disposal for the Kirkwall Cathedral restoration. The sum was not so large as had been represented. He had made inquiries in England as to how much money had been spent in the restoration of various cathedrals, and he found that the sum that was available for Kirkwall Cathedral was only one-sixth of the amount considered necessary for some of the leading cathedrals there. He was a Conservative, and he hoped he should not ask one penny to be spent on Kirkwall Cathedral unless it proved to be absolutely necessary. He would have a sacred regard for every stone in that cathedral before he touched it.

The services of the chairman, Mr. H. O. Tarbolton, president of the Association, were also acknowledged.

TESSERÆ.

Ancient Liverpool.

THE earliest building in the neighbourhood of Liverpool of which there is any record is the castle or manor house built by Edward the Confessor in West Derby, not far from Croxteth Hall, which is alluded to in Domesday Book and of which the memory is still kept up in the Castle of Liverpool. Of its style and construction we know nothing. In Liverpool proper the castle built by King John was the cause and cause of the town, the *fons et origo* of all its future greatness. It was well placed for defence according to the strategies of the day, and admirably suited for the protection of the intercourse with Ireland. The plan of the enclosure of the building was well preserved in the irregular open space around St. George's Church. What were the original features of the building is not known, but from view of the town taken at a later period it consisted of a curtain wall with semicircular towers or bastions at intervals, an entrance gateway, towers and drawbridge fronting Church Street, resembling on a smaller scale the Edwardian castles in North Wales, such as Conway Castle. Another fortified stone building called the Tower was constructed by Sir John Stanley at the foot of Water Street at the beginning of the fifteenth century, which survived through all the changing fortunes of the port, and was finally removed in 1819. Liverpool for an ancient commercial port is singularly destitute of ecclesiastical buildings. Most of the other ports at an early period distinguished themselves by the magnificence of their churches. Hull, Yarmouth, King's Lynn, Newcastle-on-Tyne, Bristol, with many others, possess Mediaeval churches on a grand scale, which testify to the liberality, taste and piety of the mercantile classes; but in Liverpool no church at all existed until the end of the fourteenth century, and then it was a chapel-of-ease to the mother parish of Walton. It was a humble structure, built in three aisles with a square end tower. It remained until 1776, when the body of the church was taken down.

The Four Bars of York.

The four bars of York have much in common. A rectangular in plan, with superstructures of two or three stages, a central passage and a barbican. Each gate retains a central part or core which is evidently Norman and represents the original gatehouse of the eleventh century early in the twelfth century. It is square, has a round-headed arch at each end or face, and the passage between, but little wider than the arch, had a flat cover of timber. There was no portcullis and no intermediate rebate, as at Sherborne, but there were two doors which opened inwards from either face. No doubt there was an upper floor, as at Tickhill, where is a Norman gate, but little altered. During the Decorated period, probably in the reign of Edward I., the old gatehouses were replaced by exterior arches were added and grooves worked for a portcullis. The walls were also cased, and the upper part replaced by a far more elaborate structure of two stories battlemented and with round tourelles or bartizans, one at each end of the front angles, corbelled out from the first and second floor. Part of these additions, however, were removed. The chamber above the portal contained still in one case does contain, the portcullis winch, and a communication on either side with the city walls, directly or by means of a passage within the rear wall of the structure. At Monk Bar the entrance portal is vaulted but the other gates retain the original flat timber roof. In front of each bar was an oblong pen or enclosure contained within four walls, and projected longways across the street. This was the barbican. The wall was about 15 feet

had battlements front and rear, and had a gateway in outer end, and flanking this gateway two dwarf barchans corbelled out over the two angles. The rampart was entered by two small shoulder-headed doorways in the portcullis chamber. This structure rose out of the hill, usually having lateral openings through which flowed water. The passage was planked, and there was a drawbridge in front of the inner gate.

The Pyramids and Railways.

We may wander on the banks of the Nile and marvel at the remains on all sides of civilisation and of art, but we are not likely to imitate either. Take, for example, the Great Pyramid of Gizeh. As a permanent monument it is perfect, but a monument of what?—of mechanical monotony, of weary waste of labour. There would be no difficulty in building another pyramid to surpass this one, and it is not surprising that some worshipper of the past has not done upon such a task. So much is often said of the chief of machinery that we may, perhaps, sometimes console ourselves if there is not such a thing as profligate waste of manual labour; and to such a question the Pyramids cannot supply an answer. No doubt a pyramid is a wonderful work, and illustrates the stage of civilisation at which builders had arrived. A great railway is a work at least as wonderful; and if we look at it in the light of a specimen of present-day enterprise, it will not compare disadvantageously with the Pyramids. Considering the circumstances of the time, the mechanical difficulties attending the erection of the latter will appear to many more formidable than in the modern case; but in the case of the railway, the triumph of intellect is immeasurably more apparent, and if we compare the results of both we find that one ministers at best to morbid ostentation while the other serves the wants of ministers to the convenience of millions.

The Connection of the Arts.

Although the connection between each of the arts is different, yet the precise nature of the bond of union is different in the case of one art to what it is in that of another; and, on the other hand, in certain instances where the material of the art varies most extensively, the mental resemblance between them is frequently very close. Thus, in regards painting and gardening, the material employed is different as possible, but the principles of design and composition applicable to each are identical. So also with respect to music and eloquence. Indeed, there is this important point as regards the connection between the arts which is deserving of such consideration, and although at first sight it may appear somewhat paradoxical, yet its truth will be evinced when the matter has been fully considered, and that is, that the greater the difference in the material availed of as the vehicle for any particular arts, the more in essence and spirit do they in reality very often coincide. For while the difference in material causes them to appear wider apart, and indeed altogether distinct and unconnected, it is the circumstance of their being so fully and so indissolubly united in soul and spirit, if we may so term it, which alone serves to preserve the connection between them, and which is also alone the essential of their connection. The first of these mutual points of coincidence is the common origin which all the arts acknowledge. They coincide with one another in their germ in the mind, in the capacities and powers described, as also as to the mode of their invention. They further agree in each being either the ornamental or the means of calling forth the refined ideas and emotions. As originating alike in nature, in the representation of her, although in different modes and under different conditions, they all further coincide. Each of the arts, more or less, is the product of all nations and all times, and is found among barbarous as well as civilised people. The same taste in the mind which originates beauty in nature, produces that in arts the most remote from this, as in music and in costume. The same emotions which are called forth by grandeur in form are called forth also by this in sound.

Mediæval Monuments.

Monuments of Christians of an earlier date are stone coffins, the top formed prism-shaped, like the sloping roof of a house, for the purpose of allowing wet to run off; for they were always placed in the open air. Very ancient monuments are without inscriptions, the form being the only guide to their probable date. It appeared that it was not till 1160 A.D. that these stone coffins with their roofs began to be ornamented. From that period

carvings, chiefly of a grotesque character, but occasionally of armorial bearings (adopted at the beginning of the twelfth century), appear on them. These are the earliest specimens of sculpture, but they rise in excellence, completeness and beauty, as the dates advance. The sloping roofs gradually disappear with the progress of sculptured emblems. Not content with merely carving the cover of the monument itself, figures were cut separate therefrom, and the roof flattened for them to be laid on it. This state of art seems not to have been arrived at till the thirteenth century, so that the spectator may be sure that a monument with a flat top is not of greater antiquity than that period, whether supporting an effigy or not. Of figures there are various kinds. Those which have their hands laid on their breasts, with chalices in them, denote that the person commemorated was a priest. Prelates are always represented with their insignia—pontificals, crosiers or mitres. Knights, again, are to be known by their armour. Most of them are lying flat on their backs, and several with their legs crossed. In this case they have been either crusaders or married men; beside the latter a statue of the wife is sometimes laid. The various descriptions of armour by which the effigies of ancient military men are covered are sure guides to the era of their existence. Warlike figures of the earliest date are found in tegulated or scale armour, like that of William Longespée, Earl of Salisbury (son of Henry II. by Fair Rosamond), in Salisbury Cathedral, who died in 1227. Chain armour, or mail composed of small iron rings, is seen on figures of later date, extending from the reigns of Richard Cœur de Lion to that of Henry III. A specimen of this kind of armour may be observed in Hitchendon Church, Buckinghamshire. Plate armour seldom appears on knightly effigies more ancient than the latter reign. Female figures adorned with a mantle and a large ring, though they afford no clue to a date, denote that the deceased had taken the vow of chastity. Armorial quarterings of arms annexed to tombs show them to have been raised subsequently to the fourteenth century, while supporters were not adopted till Richard II.'s time. At a later period, arches were raised over sepulchres to protect them from the weather, but gradually sepulchral monuments were removed within doors and built in churches. In process of time it was found that these arched monuments took up too much room even in the most spacious cathedral. To lessen this evil a plan was devised which gave rise to the practice of annexing chapels to the churches expressly for containing such mausoleums. These chapels are in many instances only separated from the main body of the building by iron rails, and are entered by doors from the side aisles. This practice was not commenced till the fifteenth century.

Tudor Hearths.

The windows had curtains, and were glazed in the manner described by Erasmus; but in inferior dwellings, such as those of copyholders and the like, the light-holes were filled with linen, or with a shutter. The hearth-recess was generally wide, high and deep, and had a large flue. The hearth, usually raised a few inches above the floor, had sometimes a halpas or dais made before it, as in the king's and queen's chambers in the Tower. Before the hearth-recess, or on the halpas, when there was one, a piece of green cloth or tapestry was spread, as a substitute for the rushes that covered the lower part of the floor. On this were placed a very high-backed chair or two, and footstools, that sometimes had cushions, and, above all, high-backed forms and screens—both most admirable inventions for neutralising draughts of cold air in these dank and chilling apartments. Andirons, fire-forks, fire-pans and tongs were the implements to supply and arrange the fuel. Hearth-recesses with flues were common in the principal chambers of houses of persons of condition; and were superseding what Aubrey calls flues, like louvre holes, in the habitations of all classes. The adage that "one good fire heats the whole house" was found true only in the humbler dwellings; for in palace and mansion, though great fires blazed in the presence chamber, or hall, or parlour, the domestics were literally famishing with cold. This discomfort did not, however, proceed from selfish or stingy housekeeping, but rather from an affectation of hardihood, particularly among the lower classes, when effeminacy was reckoned a reproach. Besides, few could know what comfort really was; but those who did valued it highly. Sanders relates that Henry VIII. gave the revenues of a convent, which he had confiscated, to a person who placed a chair for him commodiously before the fire and out of all draughts.

Jewish Architects.

SIR,—May I be allowed to point out that in the article on "Jewish Architects" which you cite from the *Jewish Chronicle* there is an important omission? Before the statement, "Every metropolitan synagogue of importance erected in the last half-century has been built by Jewish members of the profession," certain exceptions are pointed out. One of these is the new West End Synagogue (in St. Petersburg Place, close to Orme Square, W.), which is by Mr. Audsley, and practically the counterpart of his synagogue at Liverpool; and the other is the Great St. Helen's Synagogue, now to be reckoned among the more ancient places of worship.—Your obedient servant,

M. H. SPIELMANN.

21 Cadogan Gardens, S.W. :
March 4, 1905.

GENERAL.

Mr. S. J. Thacker, architect, died on Tuesday in his seventy-third year.

The Royal Scottish Academy at a meeting last week resolved to elect to the rank of Associate a member of each branch of art, viz. one painter, one sculptor and one architect. The resolution will have to be confirmed at a second assembly before the election takes place on the 15th inst.

The Dean Hole Memorial executive committee have instructed Mr. F. W. Pomeroy to execute a recumbent figure of the late Dean in marble, and in conjunction with Mr. C. Hodgson Fowler, architect to the Dean and Chapter of Rochester, to design an altar tomb or base for the figure. The work is to be completed within eighteen months. A site for the memorial will be selected in Rochester Cathedral.

Mr. Alfred Griffin, architect, has entered into partnership with Mr. Benjamin Woollard. The practice will be carried on under the style of Griffin & Woollard.

The United States Senate have passed a Bill authorising the appropriation of 1,250,000 dols. for the enlargement of the Metropolitan Museum of Art, New York. It is proposed to add a wing to the Fifth Avenue side 350 in length.

Pius X. has issued a brief to the members of the committee interested in the restoration of the abbey church of the Benedictine Monastery of Monte Cassino authorising them to undertake the work.

The Executive Committee appointed for the purpose of carrying out the memorial at Eton of Old Etonians who fell in the South African war have received a report from the committee of taste and design upon the question of the plans for the memorial buildings. The plans have been recommended and approved and are the work of Mr. L. R. Hall, to whom the first premium was adjudged in the competition open to Etonian architects last summer.

The London Corporation have decided not to hold a special loan exhibition this year in the Guildhall Art Gallery.

The Architectural Section of the Royal Philosophical Society of Glasgow elected on Monday the following Council for next session:—President, Mr. R. D. Sandilands; vice-presidents, Mr. Alexander Gardner and Mr. Isaac Low; hon. secretary, Mr. Robert Miller; hon. treasurer, Mr. Alexander Davie.

A Report is to be prepared by the city architect of Manchester, showing how the site of the Royal Infirmary can be arranged for an art gallery, reference library and other buildings.

The Rev. R. M. Sergeantson has discovered a volume of churchwardens' accounts in Burton Latimer Church, which has for binding several sheets of parchment which were taken from a fourteenth-century illuminated missal.

The Spring Picture Exhibition at the Whitechapel Art Gallery will be open from March 23 to May 3 (12 noon to 10 P.M. daily). The aim of the exhibition is to illustrate "British Art Fifty Years Ago," the year 1855 being taken

as a central date and a period of about fifteen years before that date and after it included.

The London Topographical Society will hold a convention at Drapers' Hall, Throgmorton Street, on Thursday next, the 16th inst.

The Norman Priory Church of St. Bartholomew Great, West Smithfield, will be shown and its history explained on Saturdays, March 18 and 25, at 3 P.M. crypt and other parts of the building will be thrown open without fee, but a collection will be made for the restoration of the cloister.

The Council of the University of Leeds invite applications for the appointment of a lecturer in civil engineering vacant owing to the death of Dr. George Wilson. The salary is £300 a year. The lecturer will be free to take up consulting work, provided it does not interfere with university duties. The appointment will date either from April 1 or from October 1, to suit the convenience of the selected candidate. Applications will be received until March 25.

A Collection of garden ornaments was sold by auction in London last week. A stone sun-dial brought 105 guineas; a pair of terminal figures in marble, Pan and Satyr, 140 guineas; a pair of marble vases, 89*l.*; a marble pedestal with back, 78*l.*; an Old English fountain, 55*l.*; a pair of lead vases, 54*l.*; a pair of marble lions, 46 guineas; an 8-inch square sun-dial, 51*l.*; a lead fountain, 42*l.*; a lead figure of a shepherd, 41 guineas.

The Late Fernand Duval, the French painter, has bequeathed his property to the Archbishop of Paris for the benefit of the poor of the city.

Mr. James Casey, who was on the executive committee of the Thames barrage scheme, and was understood to be the originator of the proposal, has died in St. James' Hospital, Paddington, from jaundice and syncope at the age of sixty-five.

The Housing of the Working Classes Committee of the London County Council were on Tuesday instructed to report whether the Government should be asked to pass legislation for the amendment of the Housing of the Working Classes Act, 1903, so as to extend to the owners of private estates the obligation which, by section 3 of the Act, rests upon local authorities, companies or persons to provide house accommodation for working-class persons displaced through the operation of land under statutory powers.

On Tuesday, before Mr. Justice Warrington, in the Chancery Division, the Attorney-General, Sir Robert Phillimore, mentioned the case of *Lever v. The Corporation of Liverpool*, which was in his Lordship's Chancery list, and asked that a date should be fixed for the trial, as it was a very important action with serious issues. His Lordship fixed the trial for April 6 and 7.

An Antiquarian Discovery has been made on the site of a house owned by Mr. Thomas Given, Markstown, Cullyboe, co. Antrim. Workmen were engaged in making excavations, when two large cavities were disclosed. The said to be subterranean dwellings, which were in existence before the introduction of Christianity, and formed a series of chambers or places of refuge for the ancient Irish. The entrances were built of unhewn stones, and their entrances were of such narrow dimensions as to protect effectively the inhabitants from any danger of invasion. There were a number of chambers, each measuring about 20 feet long and 10 feet high, all being perfectly formed. It was the habit of the makers of these habitations to construct them near to the water, well covered with bracken, and they were so ingeniously and so craftily concealed that the popping into them was quick and so mysteriously is presumed to have originated the belief in the existence of fairies.

Lord Ashton in November last presented the Liverpool Town Council with a sum of 30,000*l.* for the purchase and erecting an ornamental structure in Williamson Park. The proposed erection—for which plans have been prepared by Mr. J. Belcher, A.R.A.—consists of a two-story building, approached by a double staircase. In front of the latter there will be a lake with ornamental fountain in the centre. The building itself will comprise two lofty towers surmounted by an octagonal dome, and three open loggias encircle the building, the top one being at the base of the dome. From the latter position a panorama extending over 60 miles, of the Irish Sea and coast of Lancashire, from Blackcombe (Cumberland) to below Southport will be obtained. Lord Ashton has given an additional 6,000*l.* devoted to improving Williamson Park.

The Architect.

THE WEEK.

It is remarkable that in the course of a few weeks France should have lost three prominent sculptors. BARRIAS was followed by GUILLAUME, and now JULES THOMAS has passed away in his eightieth year. He was a pupil of DUMONT, and always retained the style of the master. He might also be compared with M. BOUGEREAU, for the two artists appeared to be confident to undertake any form of work in their respective arts, and to do it successfully. Each, however, excited the desire in a spectator that an attempt was not made to go further and to produce a masterpiece. JULES THOMAS won the Grand Prix in 1848 by his *Philoctetes Departing for Troy*, and on his return he gained some success by a bas-relief representing a Spartan mother receiving the body of her son who was slain in battle. It was suggested by the legend of a woman saying, "Come back, my son, either with your shield or on it." To a bust of a boy which he also produced in Rome he gave the name of ATTILA. The young Hun showed the spirit he possessed by one day trying to stab the sculptor with his knife, and his efforts to slay brought him to the galleys when he was thirteen. M. THOMAS also produced some figures for churches as well as some of the groups for the Opera House. The *Architecture* in the Musée Galliera is also by him. When it was decided to place a memorial of CHARLES GARNIER outside the Opera House JULES THOMAS produced the two figures which flank the bust; they have been recently added. For several years he was professor in the École des Beaux-Arts, and he had the privilege of occupying BARYE's chair in the Institut.

ARE there too many houses in existence in this country, or are owners become more speculative and will not make the inquiries or seek the references which a few years ago were customary before houses were let to tenants? A man and his wife were tried at the Armagh Assizes on Saturday who had a uniform system of occupying expensive houses without payment. An Irish mansion was taken at a rent of 200*l.* a year. It was decorated and furnished in a most expensive way. But neither the landlord nor the tradespeople were paid. Ireland was not the only sufferer. In Glasgow the prisoners obtained a fine house in the Nithsdale Road; at Harrogate a like course was followed, but in the latter case the house was to be bought, for the lady said, "I have never been used to pay rent." The name of the house was to be changed to "Tremont," after the Boston temple in which the Rev. HUGH PRICE HUGHES once preached. The Judge sentenced the male prisoner to eighteen months' imprisonment and the female to twelve months. The owners of the houses could probably say that investment in house property is foolish. But if people accept tenants because they give a glowing account of themselves and their wealth, they cannot expect to derive a large revenue from rents.

THE proposal for the removal of the Society of Arts from the Adelphi will be received with incredulity by many people. It is almost equivalent to the destruction of the Adelphi, for among all the buildings in that part of London the house for the Society of Arts was the best known. The Society was founded in 1754, after a project by a drawing-master. It originally occupied a house opposite Beaufort Buildings in the Strand, but the premises in the Adelphi were taken in 1774. The site was not, however, purchased, and as the lease of the renewals have expired there is now only a yearly tenancy of the premises. It would be difficult to estimate the extent of the excellent work which has

been done by the Society in its Adelphi house. But larger premises appear to be required, and it is proposed to obtain them through amalgamation with the London Institution. The latter body was incorporated in 1807, and the building in Finsbury Circus was erected at a cost of 31,124*l.* It is believed that the premises would now realise 150,000*l.* With that money and the funds accumulated by the Society of Arts and the London Institution it is believed that about 200,000*l.* could be expended. It is proposed to obtain a site from the County Council at Kingsway, and there to erect a suitable building at a cost of from 100,000*l.* to 150,000*l.* There will be general regret at the departure from the historic house in John Street; but a history no less important is sure to be created in whatever premises the Society of Arts may occupy.

THE Exhibition of Process Engraving in the Indian Department of the South Kensington Museum is of undoubted interest. But if justice were done to modern methods of reproduction the whole museum would have to be filled. Hereafter photography, if judged by its results, will have to be considered as one of the most useful arts, and the credit for it can be claimed by the nineteenth century, for although WEDGWOOD and some other amateurs in chemistry made sun-pictures, they were not like those of NIEPCE, DAGUERRE and FOSTALBOT. The art developed, but at the expense of other arts which did not rely upon chemistry. Engraving and wood-cutting are almost unknown arts. On the other hand, marvellous fidelity to an original is obtained, and when there is artistic manipulation to supplement the sun-picture a satisfactory plate can be obtained. In England hand-work is not so much appreciated by manufacturers of prints as abroad, and on that account purchasers give the preference to foreign plates. The collection at South Kensington is varied, and will be interesting to those who are engaged in the business of reproduction.

IN SHAKESPEARE'S time it was customary to prepare models of buildings. But few examples have survived. The custom was of older date, for one of St. Peter's at Rome still exists, although very few travellers have seen it. There is also a model of WREN'S favourite design for St. Paul's. But only recently has it become an example which could be seen without payment. Of late years there has been a revival of the old practice, and some excellent specimens have been seen at the Royal Academy. Supposing the production of models were to become more general the question should be asked, "What is to be done with them?" The Germans are now endeavouring to meet a difficulty of the kind. They like to deliberate over projects, and when public buildings, bridges and various other classes of works are contemplated models are prepared which are supposed to be better adapted for the comprehension of laymen than the preparation of plans and elevations. A great many examples have accumulated in the course of years, and their storage causes much inconvenience. There is satisfaction among officials whenever it is arranged to represent German construction in exhibitions, for then many models can be cleared away. But the relief is only temporary. The latest occasion was the St. Louis Exhibition, and the collection of models becomes once more an incubus which it would be an offence against the State to destroy. Accordingly it has been proposed to vote 20,000*l.* towards providing some kind of store-house in which the models could be placed, and where they might be examined by anyone interested. It would be regarded as extravagance to erect a store-house of a superior class. It has, therefore, been proposed to utilise some of the buildings of the Hamburg station in Berlin. The position is a little remote, but that is not considered a disadvantage.

LOADS ON FLOORS.

ACCORDING to physiologists, human beings alter in the course of time, and there is a difference between the present generation and that which preceded it, as there will be between the present and the succeeding generation. In considering such subjects it is necessary to assume that men can be taken *en gros*, and an average afterwards struck. The science of statistics depends on operations of that kind. Man became a subject for calculations, and extraordinary results were ascertained by QUETELET. Among his investigations were some concerning the weights of different races. He found that there was no uniformity among the inhabitants of the various countries of Europe, and according to him Irishmen were the heaviest of all those who submitted themselves to his tests. Professor FORBES took up a similar inquiry with the aid of the students of the University of Edinburgh, who might be considered as fairly representative specimens. He came to the same conclusion as QUETELET.

It might be supposed that when calculating the loads which can come upon the floor of a room, hall, bridge or other place where men assemble, all that would be necessary would be to take FORBES'S or QUETELET'S figures, and from them to arrive at the weight which had to be borne per square foot of surface. There are no doubt such averages to be found in most table books relating to construction. But the figures differ, and in important cases special experiments are made, and it rarely happens there is exact correspondence between the results and the established data. The cause of this difference is easily understood. Sometimes the men whose weights are taken are selected and are probably the heaviest to be found. At other times there is no selection and the men weighed are chance-comers. Then again if an effort is made to obtain not only the weight of individuals standing apart, but of a crowd of them, the arrangements for embodying them may be different. Sometimes the men have been placed within a hoop in order that the density of several in contact could be ascertained.

The first English experimenter who endeavoured to discover what is the greatest load which it is possible to put upon a floor was TREDGOLD. According to him, 120 lbs. per square foot should be taken as the weight of an assembly of human beings. When JOHN NASH was engaged on Buckingham Palace he made experiments on a large scale, but he could only attain a load which corresponded to TREDGOLD'S figures. That load was accordingly adopted as the standard during several years. When civil engineers arose they were not disposed to adopt information which they considered old-fashioned, and new investigations became necessary when designing footbridges, platforms and other structures. French engineers calculated that from 60 to 70 lbs. per square foot was adequate. But they were thought to be too venturesome, and to have derived their information from the weights of their small-sized countrymen. Accordingly, when the late Sir JOHN HAWKSHAW was constructing the Charing Cross Bridge, part of which was to be opened to foot-passengers, he resolved to make more elaborate experiments than had been hitherto attempted. He took the rivetters, fitters and other working engineers engaged on the works as being at least equal in weight to the ordinary people who would use the bridge. They were, in fact, of a more robust type. He found that when placed close together the weight of the men was not more than 70 lbs. per square foot. But in opposition to that experience Mr. COWPER, who at the time was a well-known consulting engineer, said he was able to arrange a crowd which weighed 140 lbs. a square foot. An Irish case was also mentioned in which labourers brought the weight to 146 lbs. per square foot.

The subject has recently been discussed in the American Society of Civil Engineers. Mr. C. C.

SCHNEIDER read a paper in which he said that "a uniform load of 40 lbs. per square foot will scarcely ever be exceeded by a crowd of people." That was considered by some of the members to be too low an estimate. Mr. L. J. JOHNSON stated that he made experiments with his pupils, "and found that 156 lbs. per square foot was attainable, without any attempt at selecting the men or crowding them to any painful degree of personal discomfort." One of his experiments was recorded by means of photographs. Sixty packed students in a box 6 feet square, the sides being 5 feet 9 inches high. They were arranged in various ways, such as distributed or placed along the sides. It was found that the result reached 154.2 lbs. Some of the men were very short, and if taller men were substituted the weight would possibly reach 160 lbs. Mr. JOHNSON remarks that a crowd of 80 lbs. per square foot can easily make way so as not to afford serious obstruction to the progress of a person who wishes to go through it, and a little persistence will enable a man to make his way through a willing crowd weighing 120 lbs. per square foot. But a closely packed crowd is not likely to be in a mood to take calmly any undue deflection or appearance of weakness in the floor, and the result of such seeming insecurity is not pleasant to contemplate. Another member referred to an office measuring 13 feet by 16 feet, in which, with pamphlets and a safe, the total load was at least 200 lbs. per square foot of floor. Mr. G. J. BLAKELY said that in American offices, especially on bargain days and during the holidays, the people weighed at least 80 lbs. per square foot. Mr. CLERMONT considered that 40 lbs. per square foot were to be taken as a standard; it would be a step in the wrong direction, and with few exceptions public buildings should be equal to a live load of not less than 100 lbs. per square foot. Mr. LOWINSON said that in country houses it was his practice to design the first floor for a live load of not less than 100 lbs.; for theatres and assembly-rooms the load should be considered as not less than 125 lbs.

The building laws in American cities often define the live load per square foot of floor. For dwellings it is in New York 60 lbs.; Chicago and St. Louis, 70 lbs. Boston, 50 lbs.; while in Buffalo and Denver it is 40 lbs. But in buildings for public assembly Boston imposes a strength equal to 150 lbs.; St. Louis 120 lbs.; Buffalo, 100 lbs.; New York, 90 lbs.; Denver 80 lbs.; and Chicago, 70 lbs. Messrs. BLACKALL and EVERETT, of Boston, found that in over 200 offices the average live load was between 16 lbs. and 17 lbs., while in the larger offices it was only about 33 lbs. From 40 to 60 lbs. is considered a high average by some designers of tall buildings.

The diversity between the figures is remarkable, and men like QUETELET would consider that the reason for it must be traced to the difference of the races who were employed as weights. It is not easy to devise a uniform system for such cases, for even with inanimate pig-iron there is risk in piling. England, as usual, endeavours to minimise the risks by adopting a high figure, and 150 lbs. per square foot is preferable to TREDGOLD'S 120 lbs. Economical construction obtains more attention in the United States than in England, and that may explain why so low a weight as 40 lbs. per square foot is approved. Considered merely as a question of weighing, the subject deserves wider attention than it has received.

There is less certainty about the weights on floors which are not used for residences. Safes with their contents form a concentrated load which should be taken into account. Books are also a dead weight falling upon a small area. In Boston the load for office buildings is taken at 100 lbs., while in New York 150 lbs. is the weight on the first floor and 75 lbs. elsewhere; in other towns the weight is taken at 70 lbs. Stores and warehouses are not classed with office buildings, for in Boston the minimum load is 250 lbs. per square foot. The difference between

various classes of goods in respect of weight is sometimes remarkable. Mr. BLAKELY, an American engineer, says that wool and dress goods in cases side by side, and not piled, produce a load of 84 lbs. per square foot. Cotton prints, under similar circumstances, produce a load of 93 lbs., and flannels in cases 4 feet high, 100 lbs. But with inanimate things it is not difficult to ascertain the exact weight, and if it is excessive provision can be made for sustaining any contingent load.

ANCIENT LIGHTS.

It was decided in *COLLS v. The Home and Colonial Stores* that, in order to be actionable, an obstruction of ancient lights must be of such a nature that it causes a substantial diminution of the light. The premises having the right to light must be rendered uncomfortable, or, in the case of business premises, unfit for the proper conduct of business. That case did not, however, decide the question whether the right to an extraordinary amount of light could be acquired by twenty years user. Lord DAVEY expressly reserved his opinion upon this point. This question has been decided in the case of *AMBLER v. GORDON*. In that case the parties had submitted their case to arbitration. The arbitrator had found as a fact that the part of the premises in question, which were occupied by the plaintiff AMBLER, who was an architect, had sufficient light for ordinary purposes, but not sufficient light for the purposes of his business, which required an extraordinary amount of light. BRAY, J., decided that the question whether for the purposes of any business an extraordinary amount of light was required was a question of fact, which it was within the competence of the arbitrator to decide upon the evidence. The arbitrator having found that an extraordinary amount of light was required, and such extraordinary amount of light having been enjoyed for twenty years, the question then arose whether user for twenty years of this extraordinary amount of light gave a right to the continual enjoyment of that amount of light; whether, in other words, the easement of the owner of the dominant tenement was enlarged, and the burden upon the owner of the servient tenement increased by twenty years user. The learned Judge answered this question in the negative. The decision in *COLLS v. The Home and Colonial Stores* is fully amounted to this—the test of whether or no an obstruction to light is actionable is, Does it amount to a nuisance? Now when the question is whether any set of acts amount to a nuisance, the law looks to see whether they could be considered to be a nuisance to a person of ordinary health and strength. The fact that the plaintiff is a delicate person, so that what would not be a nuisance to the ordinary man is a nuisance to him, cannot be regarded. So, if we regard an action for the obstruction to light as an action for nuisance, we must consider whether the light is so obstructed as to be a nuisance to the person who is using his house for ordinary purposes and in an ordinary way. To allow twenty years user of an extraordinary amount of light to give a right to that amount of light would be to allow the owner of the dominant tenement to acquire a right by acts done by himself, wholly without the knowledge of the owner of the servient tenement. The owner of the servient tenement would never know the extent of his obligations. As the learned Judge said, "The introduction of the quantum of user would work inconvenience and introduce uncertainty." Under the law as established by the two cases the owner of premises commanded by his people's windows knows his exact position. He knows how high he can raise his walls without obstructing his neighbours' lights. He knows therefore whether it is worth while to take measures to prevent his neighbours from acquiring a right to light. To decide that for twenty years of an extraordinary amount of light

could give a right to all that extraordinary amount of light would mean that the owner of such premises would never know the extent of the liability to which his omission to take measures to block his neighbours' windows would expose him. As the law at present stands the acquisition of a right to light means only that a right is acquired to the amount of light which is necessary for the ordinary purposes of social or business life. Neither the user which the owner of the dominant tenement makes of his premises nor the peculiar construction of those premises can add to the burden of the servient owner. If the servient owner's buildings allow an access of light sufficient to light an ordinary room used for ordinary purposes, all legal obligations have been fulfilled.

ARCHITECTURAL MEMORIALS IN YORK.*

THE city of York has held so important a position in the history of England, the question must often arise why it did not become the capital. Whenever it is referred to, it is as the scene of some great transaction affecting the whole State. We think of it now as if it attained prosperity as a centre of railway traffic (and it deserves to be known that GEORGE HUDSON, the railway king, was three times Lord Mayor of York), and as having no special characteristics. In the eighth century it was described as "a common emporium on land and sea." We may conclude from what is related that it was connected with traffic from the time of the Romans. They called it Eboracum, but that was only an adaptation of a still earlier name, Eborac, which probably was conferred on it by some primitive dwellers. Whether it was derived from the name of a tribe or the name of a river cannot be determined.

We must suppose that primitive settlers were attracted by the natural advantages of the site. York stood in a fertile country, possessing rivers, forests and other features prized by men who were mainly hunters. The Romans approved of what had been done by earlier possessors, and they fought desperately with the Brigantes to capture the settlement. AGRICOLA was in the North about A.D. 78, and there is a memorial of a standard-bearer of the Ninth Legion who is presumed to have been one of his officers. York still retains evidence of the Roman occupation. One mural inscription, having finely cut letters, was found in 1854 in the excavations for a drain in King's Square. It is believed to be the earliest example of its class in England. There are also remains of walling, gates and towers. Mr. COOPER says of the masonry:—

The walls are not of solid masonry throughout, but are constructed of concrete or rubble, faced with cut stones laid in regular courses. About half-way up the wall were placed five courses of bricks or tiles, to strengthen and bind together the ashlar and rubble walling. The bricks are flush with the face of the masonry but do not extend through the wall, although they are seen at the same height on both sides. The ashlar, both on the exterior and the interior face of the wall, is similarly worked.

As yet no trace has been discovered of the Imperial palace which must have existed in York, as it was the most important centre in the Roman dominion.

In the centuries which followed the departure of the Romans, York was unquestionably a coveted place and various tribes fought for its possession. There is nothing to show that Picts, Angles or Danes were among the builders of the city. The Danes were traders, and it is believed metalwork and other crafts were exercised by them in York. The city did not accept the sovereignty of WILLIAM, and in consequence there was a siege, and he succeeded. Afterwards there was an attack by Danes. WILLIAM came to its rescue, but there was really no city remaining, and his army had to encamp outside the walls. THOMAS OF

* *York: the Story of its Walls, Bars and Castles.* By T. P. Cooper. (London: Elliot Stock.)

BAYEUX, who was the first of the Norman archbishops, erected a cathedral which was afterwards altered from time to time.

Mr. COOPER gives extracts from Domesday Book which well suggest the character of York at that period. One item records that "LANDRIC, the carpenter, has ten mansions and a half which the sheriff made over to him." On which Mr. COOPER remarks:—

At this date castles were chiefly constructed of timber; the look-out tower upon the conical mounds, and the protecting stockades, placed on the earthen ramparts of the baileys, and their counterscarps were of this material. It would appear that Landricus Carpentarius was not merely a carpenter or workman, but a person of authority—perhaps the master-carpenter or engineer who directed this class of work when the castles of York were erected. This overseership, an office of consequence, probably entitled him to be acknowledged as a king's thane. At the time of the Survey, a Landric had property in Badthorpe (?) and Acaster; and a person of the same name was holding lands which the jurors said were William Malet's. These references may be to one man, Landric the carpenter, as Malet, the sheriff of Yorkshire, had charge of the castle works at York, under whom Landric would plan, prepare and superintend the fixing of the defensive timber erections.

At a later time timber was insufficient by itself for defence. York, from its importance, was often attacked, and the Plantagenet kings insisted on large sums being expended on the fortifications of the city. York was probably at that time the best fortified place in England. The remains which exist and which impart so much interest to the city are proofs of the skill exercised by the builders. It is to be regretted that many examples were destroyed because they were supposed to stand in the way of public improvements. Here are some of the acts of vandalism which were perpetrated in the early part of the nineteenth century. "In 1808 Skeldergate Postern was demolished; in 1825 the barbican of Monk Bar was taken down; in the succeeding year Castlegate Postern was removed, and the barbican of Micklegate Bar was also considered of no historic value and carted away. Layerthorpe Postern Tower shared a similar fate in 1829; Bootham Bar was deprived of its barbican in 1831, and a most lamentable breach in the city wall was made for the formation of St. Leonard's Place at that time." WALTER SCOTT expressed his readiness to walk from Edinburgh to York if the journey would induce the Corporation to preserve the Micklegate Barbican. It was likely that still greater destruction would have followed if an Association had not been formed for the purpose of protecting the remains. The interest which the walls can excite may be judged from WILKIE COLLINS's "No Name"—a book which owes much to the author's residence in York.

Mr. COOPER collects everything for his book which he considers will cast a light on the manner of building in the past. The following relating to masons' marks will show that York still possesses many of those geometrical records which, unlike ogham inscriptions, fail to be deciphered, for we cannot know the names of any one of the men who formed the angular lines:—

In the olden days, when a building of magnitude was completed, the workmen dispersed, exercising their art here and there, leaving their marks in various places, far and near. The early masons formed themselves into societies, similar to other trade guilds of the Middle Ages, and such a brotherhood anciently existed in York. Formerly members of masonic guilds registered their marks in the books of their respective societies, and some sixteenth-century lists are still extant. In the little, but beautiful, Early English church at Skelton, near York, there are the marks of thirty-five masons. It is singular that so many men should have been employed on so small a work, compared with the number engaged on other buildings of greater dimensions. From close observations we have come to the conclusion that Mediæval masons did not cut their marks to scale, or of any particular uniform size, but incised them by means of the chisel nearest to hand or last

used. Marks found on the exterior of buildings generally appear bolder and larger than those found on the inside walls. Commencing with the Early English period, many marks inscribed on interior masonry seem to have been simply scratched with a sharp-pointed tool known as a scriber. The size of the characters thus varies considerably. A series of the smallest, $1\frac{1}{2}$ inch long, may be seen on the interior walls of the church of St. Michael le Belfrey, York (Perpendicular, 1525); and of the largest, 7 inches long and deeply cut, figured on the boundary wall of St. Mary's Abbey, Bootham, York.

When we remember all the great men who have lived for a long or short time in York it is remarkable that there is no building in the city (with the exception of the cathedral) which is connected with any individual among them. The Roman wall, the bars and barbicans, the towers and posterns are all of too municipal a character to give a personal interest to the streets. It might be said that the architecture in York is historical rather than geographical, or general rather than particular. In that way York has a character that is almost unique. Nobody can visit it to see the houses which were erected by celebrities, but from the remains which are left to us we can realise the fears in which people lived of attacks from enemies, and, what is still more remarkable, from enemies who were inhabitants of the same island.

The peculiar character of York makes it difficult to write its history. Mr. COOPER, by using the antiquities as centres around which historical scenes moved, has been able to give a very clear account of the real character of the city. His book will be interesting to students of history in general, but for archæologists it will be a guide to a most interesting subject.

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the subscribers and donors was held on the 9th inst. at the rooms of the Royal Institute of British Architects in Conduit Street. Owing to the unavoidable absence of the president, Mr. J. Belcher, the chair was taken by Sir Aston Webb, who dilated upon the fact that the sum of 950*l.* had been expended during the year in the payment of pensions and in the relief of deserving cases, some of which were very sad ones. The income for that period had reached 937*l.*, and it was satisfactory to notice that 45*l.* had been obtained by income-tax rebate, but in spite of all there was a deficiency of about 47*l.* He made an urgent appeal, therefore, for additional subscriptions, and incidentally mentioned that only 5 per cent. of the members of the Institute were subscribers. He asked that architects generally would support the Benevolent Society, as they did not go outside for help. It was gratifying that Mr. W. Glover, a past president of the Northern Architectural Association, had handed to the Society a cheque for 300*l.*, and it was further announced that subscriptions of 25*l.* each would be given by Mr. Colcutt, Mr. Woodward and by himself (Sir Aston Webb). A like sum was also promised by Mr. E. Hall. The report of the Council having been duly received and adopted, a vote of thanks was accorded to the retiring members of the Council for the care and attention they had given to the affairs of the Society. The election then took place of new members for the Council during the present year, and afterwards a vote of thanks was accorded to Mr. W. Hilton Nash for his services as hon. treasurer. Votes of thanks were also given to Mr. Percivall Currey, the hon. secretary (who complimented Mr. R. Dircks for the assistance which he had rendered), and to the retiring auditors.

Mr. H. H. Collins moved that "By-law No. 43 amended by inserting the word 'vice-president' between the words 'president and Council,' and that further alterations be made where necessary to give effect to this resolution." This was carried, and the proceedings concluded with a vote of thanks to the Institute for the use of the rooms, and to the chairman (Sir Aston Webb), who suitably responded.

The Election of a Royal Academician to fill the seat made vacant by the death of Mr. G. H. Boughton, R.A., will take place on the evening of the 22nd inst.

THE BAY HOTEL, BIRCHINGTON-ON-SEA.

THIS building, of which our illustration shows the main elevation, has been erected from the designs and under the personal supervision of Messrs. Turner & Holditch, architects, of 160 Stoke Newington Road, London, N., for the Bay Hotel Company, the work having been carried out mainly by local labour, the resident clerk of works being Mr. B. H. Pearce, of Tottenham, N. The hotel occupies a bold and commanding position at the head of one of the many cliffs for which this part of the Isle of Thanet is noted, overlooking Minnis Bay in the centre of the estate now in course of development by the Birchington Bay Estate Company. The favourable position and the contour of the coast line, ably seconded by the designs of the architects, have been responsible for an ideal seaside hotel, for nearly every room commands a charming sea-view, the main entrance looking direct over the sea to the well-known Mediæval landmark "Reculvers." The elevation has been carried out in red brick obtained from the well-known local brickfields, the upper storeys being rendered in rough-cast, hand-dashed with shingle, giving the building an harmonious appearance in conformity with the other buildings in the vicinity.

Messrs. Cakebread, Robey & Co., Stoke Newington, N., are responsible for the ornamental ironwork verandah, so characteristic a feature in the "Isle of Bungalows." This firm also carried out the numerous windows in leaded lights with which the building is adorned. Other London firms

engaged upon the building were Messrs. Barclay Bros., of Devonshire Square, E.C., who supplied the whole of the joinery and turned work; Messrs. Partridge Bros., of Hackney Downs, the internal fittings and cabinet works; and Messrs. C. F. Day & Co., of Stoke Newington, N., who are represented by the mosaic tiling to hall and vestibule, all the internal tiling and the railing surrounding the hotel grounds. The kitchener, stoves and overmantels, as well as the heavy brass finger-plates and lock furniture, were supplied by Messrs. Pryor & Co., Ltd., Dalston Junction. The roof is covered with best Broseley tiles, supplied and fixed by Messrs. Roberts, Adlard & Co., of Bermondsey Wall, and the plumbing and sanitary work were carried out by Mr. C. Pindard, of Ilford.

We understand that the whole of the furnishing arrangements are in the hands of Messrs. Spillman & Co., of St. Martin's Lane, W.C., and that Mr. E. J. Smith, of Grosvenor Park, Camberwell, will supply all the blinds.

The Birchington Bay estate covers an area of about 70 acres, and possesses a sea-front extending over a mile and a quarter. There is an excellent sandy beach and capital bathing. The property is well advanced in development, many houses having already been built, and others are in course of erection. The estate also possesses a large pavilion, public gardens, &c., and the further advantage is attached of a first-rate water and gas supply. There are well-metalled roads, and the estate is within easy reach of Birchington railway station.

THE BAY, HOTEL, BIRCHINGTON-ON-SEA.

(Architects: Messrs. Turner & Holditch, 160 Stoke Newington Road, N.)

THE ST. LOUIS EXHIBITION.

AT the meeting of the Royal Institute of British Architects on the 6th inst. Mr. H. Phillips Fletcher read a paper which was entitled "Some Impressions of the St. Louis Exhibition, 1904," which he had visited as Godwin Bursar. Several lantern-slides were used to supplement the description.

Mr. Phillips said the arrangements for the exhibition began in 1898. The site selected was at the western

boundary of St. Louis. The general scheme of the plan was prepared by a committee of architects. It resembled an open fan. The centre, which corresponded to the handle, was the Festival Hall on the top of a hill. It was designed by Mr. Cass Gilbert and stood in front of his Arts Building. The latter did not correspond in colour with the other buildings, for it was constructed in buff brick, while they were of "staff" coloured white. Flanking the hall was a Colonnade of States. The preparation of the ground

required much engineering. The paving had an area of 5,800,000 square feet. Timber bridges were also constructed. The Main Exhibit Buildings were of timber, and it was calculated that the use of the material instead of steel saved from 30 to 50 per cent. The main walls had a double framing. Steel sheets were nailed to the timber and covered with fibrous plaster or "staff." The "Howe" truss was generally adopted for the roofing with timber columns. The Festival Hall was circular, having a diameter of 195 feet with a rectangular annexe. The auditorium was covered with a dome 90 feet in diameter. Externally the building was ornate, as became the focus of the Exhibition. The cost was about 53,000*l*. The United States Government Building was designed by Mr. Knox Taylor. It was neo-Classic in treatment. The approach was by one flight of steps 100 feet wide and two of 50 feet. The dome resembled that of the Pantheon, Rome; it was 93 feet in diameter and was surmounted by a quadriga. As this building, which measured 750 feet by 250 feet, had a roof with steel framing, there were no columns in the interior. The Main Exhibit Buildings were constructed by the Works Division, the façades alone being entrusted to the Commission of Architects. The arrangement appears to be gaining a foothold in the States. Mr. Theo Link designed the front of the Mines and Metallurgical Building. Obelisks flanked the entrances on the northern and western sides in order to suggest the success of the early Egyptians. Several styles were combined in the building which covered about nine acres. The Liberal Arts Building was similar in size, and for it the Louis XVI. style was adopted. The Education Building was amidst the lagoons and the internal court was covered to allow more space for exhibits. A break in the northern façade was overcome by having an entrance at the point and the colonnade on either side abutted against it. Messrs. Carrère & Hastings were the architects for the Manufactures Building, which cost about 144,000*l*. It stood on a stylobate of steps, and the arched entrances were each surmounted by a quadriga. The Louisiana Purchase Building was placed in an unsatisfactory position. One feature was a memorial having a shaft 125 feet high supporting a figure of Peace with emblematic figures of the Mississippi and Missouri at the base. In the Electricity Building the Corinthian order was used. The corner pavilions were formed as towers crowned with groups of sculpture. The Ionic order was adopted for the Varied Industries Building, which corresponded on plan with the Manufactures Building. The Machinery Building was distinguished by the height of its towers. The façades were treated as arcades, but there was a want of unity in the building when considered as a whole. The Transportation Building had an area of 15 acres. The style was an adaptation of the Louis XVI. period. Four miles of tracks were provided for locomotives and cars. The Agriculture Building was still larger, as the area was 20 acres. The roof was supported by 192 columns. The building was admired by exhibitors from its arrangement and lighting. The Horticulture Building was also simply and effectively treated. The Forestry, Fish and Game Building was also simply treated. The Administration Buildings were supposed to represent the Tudor style, and were built of red granite with limestone dressings. The Washington State Building was designed in such a way as to exemplify the character of the timber found in the district.

Japan contrived to secure the space allotted to Russia, and thus having 300,000 square feet was able to exemplify its arts and crafts worthily. The French Building was a replica of the Grand Trianon, but the charm was lost through badly painted columns. The Castle of Charlottenburg was imitated for the German Pavilion. The British Pavilion was a reproduction of the Orangery at Kensington, and was considered to be the best built. Mr. Fletcher in conclusion commented on the influence of French art on American architects. They could not escape from it even with temporary buildings. Although a new alphabet might not be required in the language of the art, there was no reason why thoughts should be expressed in the set style of one book.

The Restoration of Malmesbury Abbey has, since December 1898, been aided by contributions to the amount of 3,556*l*. 17*s*. 4*d*.; two bazaars have produced 1,045*l*. 13*s*. 1*d*., and bank interest 75*l*. 16*s*. 3*d*., making the total receipts 4,678*l*. 6*s*. 8*d*. Nearly the whole of that sum has been expended on the fabric.

TWO ROYAL EGYPTIAN TOMBS.

A CORRESPONDENT of the *Times* gives an account of a remarkable discovery by the American explorer, Mr. Theodore M. Davis, of two tombs which hitherto had escaped the notice of either plunderers or archaeologists:—

On Sunday, February 12, his workmen came across the descending steps of a tomb midway between the well-known sepulchres of Ramses IV. and Ramses XII. At the foot of the steps was a door cut in the rock and blocked with large stones. One or two of these having been removed, a boy was sent through the opening and quickly emerged with a gaily painted wand of office in one hand and the yoke of a chariot, thickly plated with gold, in the other. The opening was thereupon widened, and Mr. Davis himself stepped into the space beyond. There he found himself at the head of another flight of rock-cut steps, twenty in number, at the end of which was a second door, also blocked with stones. Here, however, the outer face of the stones was still plastered with the mud on which were impressions of a royal seal with rows of fettered captives, while on one of the lower steps the two basins of coarse red ware were lying, out of which the mud plaster had been taken. Higher up, on one of the steps, was a superb pectoral scarab, while on another step was a broken writing palette of alabaster. It was evident that the tomb had been entered by robbers shortly after its construction; that, having been surprised in their work of plunder, they had fled hastily, leaving some of the objects they had stolen in the vestibule, and that since that day it had never again been visited by man.

Professor Maspero, who happened to be at Luxor at the time, was at once communicated with, as well as other museum authorities, and although the next day was the beginning of the Baira holidays, Mr. Davis arranged to have the work of opening the tomb carried on to its completion. It was accordingly opened the following day, in the presence of the Duke of Connaught and his suite, and a marvellous sight met the eyes of the fortunate discoverer. The tomb itself was not large, and its walls had never been smoothed or decorated, but it was filled from one end to the other with the untouched and richest spoil of ancient Egypt. Mummy cases encrusted with gold, huge alabaster vases of exquisite form, chairs and boxes brilliant with paint and gilding, even a pleasure chariot with its six-spoked wheels still covered by their wooden tires, were lying piled one upon the other in bewildering profusion. It was some days before the band of explorers could even ascertain the full extent of the treasures which the tomb contained.

The sepulchral chamber is about 30 feet long and 15 feet wide, the height being no more than 8 feet. On the left-hand side of the entrance were the two great wooden sarcophagi, painted black and gold, within which the mummy-cases of the occupants of the tomb, a man and a woman, had been placed. The cases themselves were double, the outer case being completely plated with gold on the outside, except where the face of the mummy was realistically represented, while the inside was lined with silver. The second case was similarly plated with gold externally, but inside gold-leaf was used instead of silver. On one of the mummies a few objects were discovered such as were usually buried with the dead—a "heart-scarab" made to imitate lapis-lazuli, another scarab of black-painted wood, a gilded "dad," the model of a hoe and the like. Over a gilded mask, which must have belonged to one of the mummies, a veil of black muslin, or rather crape, was drawn. It is the first time that anything of the kind has been met with in Egypt.

The inscriptions on the cases, as well as on other objects found in the tomb, showed to whom it had belonged. It was the burial-place of Yua and Thua, the parents of the famous Queen Teie, the wife of Amon-hotep III. and the mother of the "heretic-king" Amon-hotep IV., of the eighteenth dynasty. It was to her teaching that the religious revolution attempted by her son seems to have been due, and since the discovery of the cuneiform tablets of Tel-el-Amarna the Assyriologists have believed that she was of Mesopotamian descent. This belief is confirmed by the inscriptions found in Mr. Davis's tomb. In these the names of her parents are written in various ways, indicating that there was no fixed spelling of them, and that the Egyptians of the eighteenth dynasty had the same difficulty in pronouncing and reproducing foreign names as their descendants have to-day.

No light, however, is thrown by the inscriptions upon the parentage of either Yua or his wife. Thua is merely

"the chantress of Amon," and it is clear that she and her husband were not of noble, much less of royal, birth. They must have lived, however, at Thebes with their daughter after her elevation to the position of "chief wife" of one of the greatest of the Egyptian Pharaohs, and here they died while Amon-hotep III. was still on the throne and the wealth and power of Egypt were still undiminished. Queen Teie, with all her influence, had been unable to overcome the jealousy of the Egyptian aristocracy and include her parents in its ranks, but she revenged herself at their death by giving them the honours of a royal funeral.

Beyond the coffins, at the western end of the tomb, the ground was covered with large sealed jars of wine or oil and shell-like boxes of black-painted wood, each of which contained a piece of cooked meat neatly wrapped in black muslin. Planted on the top of them was the chariot, broad enough to hold two persons, richly painted and encrusted with gold. The leather-work belonging to it is still as fresh as when it was first made. Here also were found the four canopic jars of alabaster in which the entrails of the deceased were deposited. It would be difficult to match them as regards either size or fineness of workmanship. The heads which form their covers are in the best style of Egyptian art, and on being lifted were found to have under them a second set of heads, the latter being of plaster coated with gold. At the eastern end of the tomb two other alabaster vases were discovered, each of them with handles and of exquisite workmanship.

This eastern end of the tomb contained a large number of small objects. There were among them seven pairs of sandals, most of them of papyrus, but one of them was of stamped yellow leather and another had been gilded. On the floor were numberless boxes, each of them occupied by an "ushebti" figure of considerable size. Many of the "ushebti" were of wood, but some were of alabaster, and there were two of gold and two of silver. Here, too, was a second wand of office, together with vases and boxes of gaily-painted wood. Among the boxes perhaps the most interesting is a large "clothes chest" of palmwood and papyrus; it is lined inside with papyrus, has two fastenings of string, and contains a second case or shelf with papyrus flaps. Apertures have been made in the sides for the sake of ventilation.

Some of the objects bore the names of Amon-hotep III. and his queen. This was the case, for instance, with a large vase of alabaster, as well as with a sort of box-stool, resplendent with gold and blue enamel, on the cover of which the king is represented as sitting on the hieroglyphic of "gold." On another box, which is fashioned like a small table with legs, the Pharaoh is depicted in the same attitude, yellow paint taking the place of gold on a third box of smaller size. Among minor objects, one of the most beautiful is a kohl-case of blue faience with the cartouches of the king. Near the latter the gilded handle of a mirror was picked up, together with a stone box, painted white and stuffed with cotton, the lid of which represented a recumbent mummy with a winged soul on the breast. In another part of the tomb were two large wigs.

At its eastern extremity there was also a small arm-chair, the back of which is formed by the figures of the god Bes and a monkey on either side of him. Two other arm-chairs were discovered in the western portion of the tomb. The largest of these, with its seat of interlaced palm-fibre, is profusely ornamented with figures in black and gold. At the back is a double representation of "the eldest daughter of the king, Amon-sit"; in each representation she is seated on a throne, with a winged solar disc above, and a female slave bringing her the offering of a golden collar, while under each arm of the chair are three other female slaves holding up their offerings of rings of gold. An inscription tells us that the gold had been brought from "the lands of the south." The legs of the chair are modelled after those of an ox, and above each of the front legs is a boss in the form of a human head. There is a second and rather smaller arm-chair which also belonged to Amon-sit, who was a daughter of Amon-hotep III. On the back of this the princess is represented sitting with a cat under her chair and a female attendant on either side, while under the arms of the chair is the figure of Bes between two monkeys. The picture of the princess and her attendants is lined on either side by the so-called Greek fret, an interesting illustration of the intercourse that existed at the time between Egypt and the Egean. The two chairs of Amon-sit might have been regarded as presents from the princess to the occupants of the tomb, were it not that three funeral biers, and not two

only, have been found in it. This seems to indicate that the tomb of Yua and Thua had already been the burial-place of a member of the royal family, and that when all the objects which now cover the floor can be removed and packed we may hope to discover a "well" or chamber in which the sarcophagus of its original occupant rests.

A pathetic relic of a dead world is a mat of palm-fibre on which the figure of Osiris was delineated in soft mould. Seeds were then sown in the mould, and in the green grass which sprung from them after the tomb had been closed and sealed the Egyptians saw an image and earnest of the Resurrection. A similar "bed of Osiris" had already been found in the tomb of Amon-hotep II.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

A PAPER on "Architectural Photography" was read at the meeting of the Leeds Society on the 9th inst., by Mr. E. C. Skill. A brief sketch was given of the struggles of the pioneers in the science of photography. Experiments and discoveries were made by Scheele in 1777 with the action of light on silver compounds, followed twenty years later with a further application of these primitive discoveries by Wedgwood and Davy, who obtained pictures of objects they wished to copy by throwing the shadow upon paper impregnated with the silver salts, thereby producing a white image upon a dark ground. The work of Daguerre and Niepce was mentioned, also the discoveries and patents taken out by Mr. Fox Talbot for his photo-lithographic process-work, &c., an illustration from one of his original results being shown. Mention was made of the discoveries and experiments with bichromate of potash, and of the carbon printing process patented by M. Pontevin in 1855. After comparing this later process with one in use at the present time, the lecturer dealt with the subject of the evening and proceeded to give a rough illustration, with description, of the camera best suited for architectural purposes. While not altogether condemning, he discountenanced the hand camera, as being unsuitable for this class of work. Suggestions were made as to the most suitable lens or form of lens to be chosen, and the names of some of the most noted makers, both English and foreign, were given.

The choice of time and proper illumination for buildings to be photographed was dealt with, the lecturer remarking that frequently what might have been good pictures suffered for want of a little care in this direction, especially by beginners. Slides illustrating this were shown. The choice of plates was next considered and comparisons made between backed and unbacked ones. A diagram was shown illustrating the cause of "halation," which was described. Examples of photos showing comparison between both kinds of plates were exhibited. The orthochromatic plates and screen were described by the aid of a diagram showing the action of a screen when interposed between the lens and plate. On this the two extreme rays of light, viz. violet and red, were delineated, and some idea of the controlling power of the screen upon the undulations of the violet ray was given. Two slides of exposures made through a set of coloured glasses in conjunction with white followed firstly on an ordinary plate, and other exposures on orthochromatic plates in conjunction with different screens were shown, after which some flower studies and views taken under similar conditions were exhibited illustrating the effect of colour under different treatment. Architectural work was again considered and a number of slides shown, with notes on the arrangement of perspective and the conditions under which operations frequently had to be carried out, also the best method of lighting or choosing light for subjects in relief. The lecturer concluded with a few remarks on the help of photography to the architectural student and its use in making valuable records of ancient buildings, &c.

A vote of thanks to the lecturer was proposed by Mr. Robert Hudson and seconded by Mr. Butler Wilson.

An Arrangement has been arrived at by the Corporation of London and the London County Council respecting the Escape from Fire Bill and the Building Acts Amendment Bill. Both Bills were read in the House of Commons on Tuesday, and the discussion of clauses will be heard by a committee. All the clauses in the Council's Bill except those relating to fire protection have been dropped.

NOTES AND COMMENTS.

DODWELL describes the entrance to the Treasury of ATREUS at Mycenæ as 9 feet 6 inches wide at the base, 7 feet 10 inches at the top, and about 19 feet in height. It might from the description be supposed to be an unobtrusive entrance to the treasury. But it is assumed that the wall was flanked with columns or semicircular pilasters which were wider above than below, and were probably decorated with spirals and other ornament. DODWELL describes a columnar pilaster of a soft green stone singularly enriched with spiral and zigzag ornaments of an Egyptian rather than of a Grecian character. The late M. CHIEPZ, in the restoration which appears in his volume on archaic Greece, has shown the pillars adorned somewhat after the manner that is represented in DODWELL'S book. He omitted, however, the spirals, which are an important feature. One of the columns is believed to have been obtained by the second Marquis of SLIGO, and has been lying at his house in Westport for about ninety years. The present Earl of ALTAMONT last year realised the importance of the relic, and after testing drawings and measurements which he made at Mycenæ, his father, the Marquis, has presented the column to the British Museum. It is proposed to add a capital, and a very beautiful base is shown by DODWELL. The gift will, therefore, be a valuable addition to the collection of Greek work in the British Museum.

THE directors of the tube railways in London have reason to congratulate themselves on the comparatively small sums which have had to be paid for injuries to buildings. It was believed that houses along the line would be dislocated, and that the compensation would be beyond precedent. The case which was tried before Mr. Justice LAWRENCE on Friday last is therefore ominous. It was claimed that during the works on the Great Northern and City Railway a house in Highbury Crescent, which was worth 120*l.* a year, had subsided, and that the restoration cost 1,111*l.* The leaseholder was put to an expense of 450*l.* in having to remove, and no higher rent than 90*l.* could be obtained for the house. The Act stated that the iron casing of the tunnel was to be properly grouted with cement, but it was admitted that lime was used instead, and that such grouting might contract when it cooled. All the injury might easily be compensated for. But the question arose, What damages would be claimed from the leaseholder by the landlord when the lease expired in 1909, especially as in the lease the strictest liability for repairs was agreed to? The jury found a verdict for 2,000*l.* damages, and the result is not unlikely to inspire the raising of other claims.

THOMAS TWOPENNY, F.S.A., who lived from 1797 to 1873, was, we imagine, a conveyancer of the type of Mr. HIRAM GREWGIOUS, of Staple Inn. He had a weakness for ancient work, and among his productions is a lithograph with the title "A Stack of Ancient Chimnies and a Stack of Modern Chimnies, respectfully offered to the notice of the British Architects of the 19th Century by an Amateur," which may have had some effect on later building. He was a careful draughtsman and the British Museum possesses a very large series of drawings by him representing architecture, furniture, woodwork and ironwork, all derived from English examples. MESSRS. ARCHIBALD CONSTABLE & Co. have produced copies of ninety-three of the drawings under the title "English Metalwork." There are examples of leadwork, cast-iron work and wrought-iron work. They are of a size which would enable a metal-worker to produce similar objects with all their detail. We may assume them to be made by English hands, and the greater number belong to the Gothic period. They are all admirable, and the book will be a valuable auxiliary to anyone who has to design metalwork in connection with building.

ILLUSTRATIONS.

CHATEAU D'AZAY-LE-RIDEAU, INDRE-ET-LOIRE.

TOURAIN, although rich in historical monuments, possesses few buildings which will be found worthier of close examination than this château. Not so much on account of its historical associations, for in this respect Plessis, Blois, Loché and others far surpass it, nor even because of any very striking picturesqueness, but for its quiet, unobtrusive elegance, the feeling of which grows upon you as you wander round the building, and which characterises the details no less than the whole. The river Indre here divides itself into two arms, which embrace the small island almost entirely occupied by the château, planned somewhat in the form of the letter L. The building, says Mr. HAIG, is an exceedingly well preserved example of the refined Renaissance of the first half of the sixteenth century, having been erected during the reign of FRANCIS I. by GILLES BERTHELOT, whose initials appear not only over the main entrance, but interlaced with foliage and scrollwork in some of the dormer gables. Over the entrance appears also FRANCIS'S emblem, the salamander, so often introduced in French work of this style and period, some niches, now empty, and much ornament carved in low relief, enriching a graceful composition of three orders terminating in a curvilinear gable. The enrichments, attributed to JEAN GOUJON, are most of them exquisitely carved. All the masonry is excellent, and the material is a very light cream coloured, nearly white stone, not perhaps sufficiently toned down by age to satisfy the sense of colour, but bearing an aspect of refinement. As this stone is easily carved, the ornaments are often very minute, and as it is also durable, it is only in the most exposed parts, such as the dormer gables, for instance, where any marked decay is to be observed. Lightly touched by time, the building has suffered but little at the hand of the restorer; and, fortunately, where any repair has been attempted it has been lovingly and reverently done, and in a true conservative spirit. The interior of the château has undergone scarcely any alterations. The staircase is admirable; the old portraits and the old furniture are interesting, and this monument from a picturesque period of art is well worthy of a visit, and deserves to be mentioned as one of the few dealt kindly with by the modern proprietors.

HALL, ST. JOHN'S GATE, CLERKENWELL.

MANY visitors to Clerkenwell when they see St. John's Gate imagine it a surviving representative of the old City gates. It is not very ancient, for it dates from A.D. 1504, and it served not as a public approach, but as the entrance to the Priory of St. John. The monastic buildings were demolished as a consequence of the Dissolution, and the materials were utilised for old Somerset House. The gateway was allowed to remain. In the eighteenth century it was used as the printing office of the *Gentleman's Magazine*, and Dr. JOHNSON said he "beheld it with reverence" when he first came near it. Afterwards he was the principal writer for that periodical, if not the editor. It is remarkable that afterwards JOHNSON'S name was more associated with the gateway than any other. The tenants of the tavern looked on his memory as a sort of chattel. Fortunately the structure reverted to uses which were more allied to those of the founder. The Order of St. JOHN of Jerusalem, which was introduced into England about A.D. 1100, was reincorporated in 1888. No more appropriate habitation could be found for the knights of justice, ladies of justice, knights of grace and other members than the room in the Clerkenwell gateway, which, as the illustration shows, is now in a condition that recalls the old glories of the Priory, when its superior ranked as the first baron of England.

CATHEDRAL SERIES.—ST. ASAPH: GENERAL EXTERIOR, NORTH SIDE.

ELDER LIBRARY, GOVAN, N.B.

ALLHALLOWS BARKING.

ALLHALLOWS BARKING was the subject of the second winter visit of the Upper Norwood Athenæum, under the guidance of Mr. Theophilus Pitt, F.C.S. It was arranged that the members and their friends should meet at St. Olave, Hart Street, and inspect that church, as many of the members had not seen it when visited by the Society in 1894. A brief outline of the principal features of the church was given, its dedication in honour of the Norwegian king and saint, Olaf, who came to London in the year 993 with ninety-four ships, and, fighting against the city, met with a stouter resistance than he had anticipated, so that he had to retire to the south coast, plundering as he went. King Canute acted with diplomatic instinct and sent a bishop and alderman after Olaf, offering him tribute and food if he would cease to plunder; the bishop and the alderman led him to the king at Andover, and a covenant was made and an *entente cordiale* established, which made Olaf a friend of the English, whom he afterwards assisted in defeating the Danes. In the year 1030 he was slain by his own people at Stiklestad, and afterwards sainted. Thus the "Anglo-

Misselbrook, whose care for the treasures under his charge, and Mr. Frank McDuell, whose excellent photographs of Barking Church and its brasses have been generously placed at the disposal of the Society, are entitled to cordial thanks.

The following address was delivered by Mr. Theophilus Pitt:—There are not many who remember that the site of the present wide street to the north of Allhallows Barking Church leading to Tower Hill was, within living memory, covered with houses. Yet a narrow street, called Barking Alley, ran parallel with the north aisle and led to Tower Hill, the side of the lane opposite the church being occupied by seventeenth and eighteenth-century houses with small shops. A ventilating shaft for the railway occupies the position of the centre of Barking Alley, while a skyscraper of massive proportions and glaring ugliness dominates the position at the east end of the church, and a warehouse is built right against it in the south-west corner. The houses which formerly stood on the north side were built on what must have been a portion of the churchyard, or cemetery as it was called, in which stood, about a hundred yards to the north, the chapel of Our Lady of Barking.

ALLHALLOWS BARKING.

axon Chronicle." Other churches in London were named after the great Northman, indicating his popularity in the city—St. Olave, Silver Street; St. Olave, Old Jewry; and St. Olave, Southwark; in the latter case the street in which the church was built became St. Olave's Street, now known to us by the contracted form of Tooley Street. Other churches are dedicated to St. Olaf in Exeter, Chichester, York and Chester, at Creeting in Suffolk, Poughill in Cornwall, and St. Olav's in Orkney and St. Olave's near Yarmouth serve to indicate the widespread reverence with which he was regarded. The association of Samuel Pepys with the church of St. Olave, Hart Street, the monument to his wife, the tablet to his own memory unveiled by Mr. Russell Powell, the interesting brasses to Sir John Haddon and John Orgone, the former having the words "Justifica nos" referred to in the paper, and the latter the woosack, merchant's mark and rhyming epitaph given in the *Record* 1894-5.

Berkyng Church by the Tower was then visited, and very detail carefully inspected by the members, who all expressed admiration at the beauty of the church and the wealth of its ecclesiological and historical traditions. Mr.

The Venerable Bede tells us how, about the year 675, Archbishop Theodore appointed Earconwald Bishop of the East Saxons, in the City of London, what time Sebba and Sighere were kings. Before he became bishop, Earconwald had built two monasteries which became famous, one for himself at Ceortesei (Chertsey), the other for his sister, Ethelburga, at Bercingum (Barking), and established them both in regular discipline of the best kind. It was Earconwald that built the gate at Bishopsgate, and it is interesting to note the proximity of a church dedicated in honour of his sister, Ethelburga. He was the first Bishop of London to be canonised, and his shrine in Old St. Paul's was the great treasure there; it disappeared with the tomb of King Sebba and an untold wealth of historical interest in the Great Fire of 1666.

"It is presumed," says Dr. Mason, "that the fifteen acres which constitute the parish of Allhallows belonged to St. Erkenwald, and that the manorial rights over them and the tithes were part of his endowment for the magnificent foundation (Barking Abbey). At any rate, so far back as the reign of Stephen, the parish is called Barking Church, and though at that time the advowson was in other hands—

those of the cathedral chapter of Rochester—it passed, or passed back at an early time, to the convent at Barking.”

The early history of Allhallows Barking is thus somewhat vague. The earliest church was, of course, Saxon; the nave of the present building has columns of the Norman period, “circular and massive, with capitals formed by a few simple mouldings.” The capitals of one or two piers and an arch at the west end of the nave have been left untouched by successive restorers; until recently these piers were enclosed within a screen which carefully guarded a supply of coals and the unconsidered trifles usually associated with church cleaning so dear to the nineteenth-century mind; a commodious choir vestry has replaced them all. Of this Norman church nothing more is known than can be seen with the eye. It would be interesting to know if the apsidal termination, the stilted horseshoe arches and the ambulatory, features common to St. John’s Chapel in the Tower close by and to St. Bartholomew-the-Great, also obtained in the Norman church of Allhallows Barking. The piers had been, up to the time of the recent restoration, thickly coated with white paint, the removal of which disclosed traces of colouring.

The nave arcades are formed of arches acutely pointed and plainly chamfered, without moulding, clearly suggesting an Early English origin. Of the Decorated period there is a piscina on the easternmost pier which has been recently disclosed. The east window had its tracery renewed in the restoration of 1814, probably on the lines of the former

still remains. The inscription, copied at the time, “Hic jacet cor Ricardi regis Anglorum,” is in characters indubitably of the period of Richard I., and we may reasonably be excused from believing that the heart of Richard Coeur de Lion rested at Barking, unless the Canons of Rouen lent the relic to the chapel of Our Lady of Barking for a time, a not unusual circumstance in the case of relics of saints in Mediæval times. The chantry chapel of St. Mary of Barking became famous; Edward I. placed a statue of the “Glorious Virgin” in it, and John Tiptot, or Tiptoft, created Earl of Worcester by Henry VI., when he was Constable of the Tower, founded in connection with the chapel a guild presided over by a warden, one of the first to fill the office being the Sir John Croke whose supposed tomb stands in the north aisle of the present church. Tiptot was the friend and patron of Caxton. Though beheaded on Tower Hill his body was not buried in the chantry chapel. The chapel was rebuilt by Richard III. who raised it to further dignity by appointing a dean and six canons; the first dean was Chaderton, then vicar of the parish. Finally the chantry was suppressed by Edward VI. and thereafter disappeared with all it contained.

The brasses in Allhallows Barking are more numerous than in other City churches; here there are sixteen, complete and incomplete. St. Helen’s contains eleven, including three from St. Martin Outwich; St. Olave, Hart Street, five, including two from All Hallows Staining; St. Andrew Undershaft, two; St. Dunstan-in-the-West, two; there is

ALLHALLOWS BARKING: NAVE ARCADE.

existing window, in which case the fourteenth century would have its representative in this window. The remaining portions of the structure are the chancel arches, of very late Perpendicular character, and the clerestory and aisle windows, probably the result of “making newe all the upper windowes and severall side windowes” in 1634, at a cost of over 1,400*l*.

King Richard I. founded the chantry on the north side of the church, and in a document of Edward I. prayer is especially enjoined on behalf of the soul of Richard I., “whose heart is buried beneath the high altar.” This statement is adopted by Stow, but whatever the ground for the statement may be, it does not coincide with the facts as we have them. Richard I., “cor-leonis dicti,” died April 6, 1199. He received his death-wound under the walls of the castle of Chaluz, in Limousin. He bequeathed his heart to the canons of Rouen, whom he had benefited during his lifetime, and his body to be interred at the foot of his father’s tomb at Fontevrault, and there are recumbent effigies of him at both these places. Investigations were made at Rouen in 1838, and the receptacle containing the heart was “discovered” in the choir. A detailed account of the subject may be seen in “Archæologia,” 1842 (vol. xxix. p. 202), from which it would appear that all reverent care was taken of the remains; but when in Rouen in 1899, the writer saw the leaden casket which contained the heart, empty, and in the museum of the cathedral on the north side of the nave, near the west doorway, where it presumably

one at St. Bartholomew-the-Less, one at St. Martin, Ludgate, and a palimpsest in the Guildhall Museum. Moreover, the earliest brass in the City is at Allhallows Barking. It is that of William Tonge (1389), and the date is known through the important fact that his will is preserved,

THE EARLIEST CITY BRASS (1389).

in which he left ten marks to Barking Church. The brass consists of a shield charged with a fleur-de-lis, and surrounded by the inscription:—“Pries p’ l’alme Willm. Tonge g’gyt ycy Ky Dieu de sonn alme eyt

Next in order of date is a brass to John Bacon and his wife (1437). Like John Orgone at St. Olave's, Hart Street, John Bacon is represented with a wooll sack, upon which his feet rest, for he was a citizen and woolman, as the inscription declares. Then an imperfect brass to Thomas Virby (1454), who was vicar of Allhallows Barking and was imprisoned for the perpetration of a pious crime. There is some doubt about this brass; the canopy is executed in distinctly Decorated style, which suggests that the inscription belongs to some other brass. John Croke (c. 1500) is generally supposed to be commemorated, by a large altar tomb in the north aisle from which the name of the date are missing, but the brass figures on the back of the tomb. Sir John Croke was an alderman and skinner, and one of the wardens of the Guild of St. Mary. The brass to Thomas Gilbert (1489) describes him as "civis et draper merc Staple Callis." This is fragmentary, and the inscription also commemorates "Agnes ux ejus." The

are above and the merchants' mark below the figures. The inscription at the foot has been mutilated, and the brass still retains traces of colour. The brass to William Thynne (1546), Clerk of the Green Cloth, Clerk of the Kitchen and afterwards Master of the Household to King Henry VIII., was relaid and restored by Waller in 1861 at the expense of the Marquis of Bath. He is represented with his wife, Anne, a daughter of William Bonde. He was the editor and publisher of the first complete edition of Chaucer's works. The brass is a palimpsest, "almost entirely made up of earlier pieces; on the reverse of the male effigy is part of a body in mantle, with cord, tassels and rich girdle (c. 1530); on the reverses of parts of the female effigy is a priest holding a chalice (c. 1510), and on the reverses of parts of the marginal inscriptions are portions of another inscription in English." On a pier in the south aisle is a quadrate plate, with male effigy, wife, three sons and two daughters, commemorating William Armer, Governor of

ALTAR TOMB OF SIR JOHN CROKE.

BRASS OF ANDREW EVYNGAR (1530).

ss to John Rusche (1498) has a dog at the feet of the, and Christopher Rawson (1518), with his two wives, represented by a brass in the south aisle, having a mutilated inscription and four scrolls. He also was a merchant of the Staple of Calais and a mercer. A scroll over the effigy reads, "O beata Trinitas," and over Rawson and his wives other scrolls appear, labelled respectively, "Justifica nos," "Libera nos," and "Salva nos." Rawson in his will ordered the words "Sanctifica nos" to be engraved on the brass, but it actually appears as "Justifica nos." The latter phrase occurs on the brass of Sir Richard Haddon in St. Olave, Hart Street. Christopher Rawson's brother, Richard Rawson, was rector of St. Olave's from 1510 to 1518, and it is probable that both inscriptions were from the same hand. Next in order of date is the brass to Andrew Evyngar (1535), his wife, son and daughters; this is a fine brass laid in a slab, the left side of which has been destroyed, together with the inscription it bore. The figures are, under a canopy of pointed arches, and in the center is a pieta, Our Lady of Pity. The arms of the Merchant Adventurers' Company and the Salters' Company

the Pages of Honour to Henry VIII., Edward VI., Mary and Elizabeth, who died in 1560. In the nave, between the choir stalls, Roger James (1591), a Lower Thames Street merchant of Dutch parentage; he came to England in the reign of Henry VIII., and was an ancestor of Lord Northbourne. Other late brasses are one to Margaret, wife of Arthur Bassano, and Camela, wife of Henry Whitton, in the south aisle (1620); one in the north aisle to George Snayth, Laud's steward (1651); and a late and undated representation of the Resurrection and a scroll, with male effigy, wife, three sons and four daughters. Two minor brasses consisting of shields charged with arms of various persons brings up the list to sixteen, a very goodly number.

The registers of Allhallows Barking date from 1558; had they commenced three years earlier we should probably have been able to see the entry recording the baptism of Lancelot Andrews, who, born in 1555, used to pray "for the church of Allhallows Barking, in which I was baptized." The communion table was given to the church by John Burnell in 1613, and the pulpit ordered in 1638 in these

terms, "take care that new pulpett hedde be made in regarde the old one is too small." It was made by a Mr. Lane at a cost of 19l, and the hexagonal sounding-board has the curious and unusual motto in a panel, "Xpm pdicam crucifixum." In 1649 the church was damaged by an explosion of gunpowder in a ship-chandler's shop in Great Tower Street; over fifty houses were destroyed and many lives lost; the following morning a female infant was found in her cradle on the leads of the church; she grew up "a proper maiden." The tower of red brick which was erected after the destruction of the former one in this explosion was one of the few ecclesiastical structures erected in the Commonwealth period; the church at Wrotham is one of these, built by Sir Harry Vane.

Amongst other entries in the registers is that of the baptism of William Penn on October 23, 1644. He became a Quaker and was thereupon disowned by his father, Sir William Penn, whose efforts in the Great Fire of 1666 to arrest the progress of the flames, which destroyed the parsonage house, appear to have been successful. Samuel Pepys mentions that his wife called him up at two in the morning to tell him that the fire had "come to Barking Church." Then there is the entry in the register:—"Died January 10th, buried 11th, William Laude, Archbishop of Canterbury, Beheaded," and a further word which was erased later. The body was removed to the chapel of St. John's College, Oxford, in 1663.

The sixth President of the United States of America, J. Quincy Adams, was married here July 26, 1797, to Louisa Catherine Johnson, of this parish. The present porch is the design of the late J. L. Pearson, R.A., who had charge of the recent restorations, not yet completed. On the porch are three statues by Nathaniel Hatch, the artist employed on the north transept of Westminster Abbey. The centre figure is that of the B.V.M., and on either side are St. Ethelburga and Bishop Andrews; the arms of the see of London and St. Erkenwald, of the Convent of Barking and St. Ethelburga, are added with appropriate purpose.

There was a time when the History of Allhallows Barking, by the Rev. Joseph Maskell (1864), was almost the only available source of information with regard to this interesting building. It required amplification and exposition. More recently Canon A. J. Mason (*Nineteenth Century*, May 1898) has written the "Romance of an Ancient City Church," the Rev. Dr. Biggs a booklet, "Berkynge Church by the Tower," and Mr. Philip Norman, F.S.A., read a paper in 1902 which will be found in the Transactions of the S.P.E.S.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of this Association took place on Friday last at the Royal Architectural Museum, Tufton Street, S.W., Mr. E. Guy Dawber, president, occupying the chair. Prior to the reading of the paper Mr. Guy Dawber announced that the students had organised a smoking concert to be held on March 28 at the Monico, Piccadilly. A hope was expressed that there would be an unusually large attendance, as any balance will be contributed to the new premises fund.

Mr. H. V. LANCHESTER then read the following paper on

Law Courts.

When you kindly invited me to read this paper I selected "Law Courts" as the subject, not so much in the hope of being able to contribute very much to the knowledge that most of you already possess, as because it seems to me that of the various problems in planning that the architect is called upon to solve this is one that involves the use of nearly all the expedients that are demanded, and is perhaps the most typical of the methods to be adopted in matters of arrangement, while at the same time there is considerable scope, in larger examples at all events, for the study of architectural expression.

In this matter of architectural expression the continental nations are noticeably our masters. Comparing most of our public buildings with those of equal importance abroad, while we find that at home they are too frequently pinched and ineffective, wedged into irregular sites between commercial premises, abroad we see a massive and imposing pile, its dignity enhanced by judicious isolation from all mean and unworthy surroundings, approached by a noble avenue or a spacious square. The rooms are lofty, the corridors wide, and everything is calculated to impress one with the importance of the building and its uses; but as far as ingenuity of arrangement goes, it is inferior to the cramped little concern familiar to us at home, and as

regards the specific provision for its purpose, very little study seems to have been expended; in many cases the outline plan would hardly inform one whether the building was municipal, legal, or residential in its intention, while a few modern plans in our own country would fail to show at a glance whether they were for town hall, law court, or palace. Lest we should feel inclined to congratulate ourselves unduly, it behoves us to consider whether we do attach too much importance to our clever little schemes specialising the routes and entrances in our designs, and whether the Englishman's mania for privacy is not carried beyond what is either essential or desirable. I certainly incline to this view myself, and think that we should occasionally make some concessions in minor points, if by such a course we can strengthen, if one may use the term, the dramatic force that a fine architectural treatment exercises. As an example of the importance attached abroad to worthily and suitably expressing the purpose of such a building, one need only cite the Law Courts at Brussels, where the intention of impressing the mind with the power and dignity of the law is so successfully fulfilled. The Courts at Paris, though most interesting in themselves, are less suitable as an example, for, in spite of Duc's masterpiece, they represent, as a whole, a gradual aggregation which cannot be regarded in the same light as a completed study from a hand.

While far from desiring to detract from the design of our own Courts of Justice, combining as it does remarkable grace of detail with vigorous composition, it must be admitted by all that the internal arrangements fail, both from a practical and an architectural point of view, the chief defects being the divorce of the great hall from the court, and the consequent meanness of the approaches to the latter. One of the most striking and typical examples of assize courts is that at Manchester, by Alfred Waterhouse, of which a plan is published in the *Transactions* of the Institute of June 12, 1865. If you refer to this you will note the skill with which the somewhat complex problem is met, and, taking into consideration the fact that the public galleries are practically on the same floor as the courts, the satisfactory separation of the officials, Bar and witness, with the consequent avoidance of awkward cross-currents.

You are doubtless familiar with the plan of the Birmingham courts, which are universally considered to be most admirably arranged. In this case the large hall is in daily use, as it serves both police and assize courts; in fact, the latter are very much used throughout the year, and the large hall is a great convenience.

In the case of the Old Bailey courts, the site was a somewhat limited one for the accommodation required, and of this account the problem is treated in a simpler manner. As you have most of you recently visited the building, it is hardly necessary to embark on a detailed description, and may suffice to mention that the courts are grouped in two adjacent pairs, separated by the main staircase and lighting area, while a corridor in front serves witnesses and Bar, and another behind the Bench; the judges' and juries', the barristers' rooms are on an upper floor, and a suite at the south end of the building is provided for the Lord Mayor and City authorities.

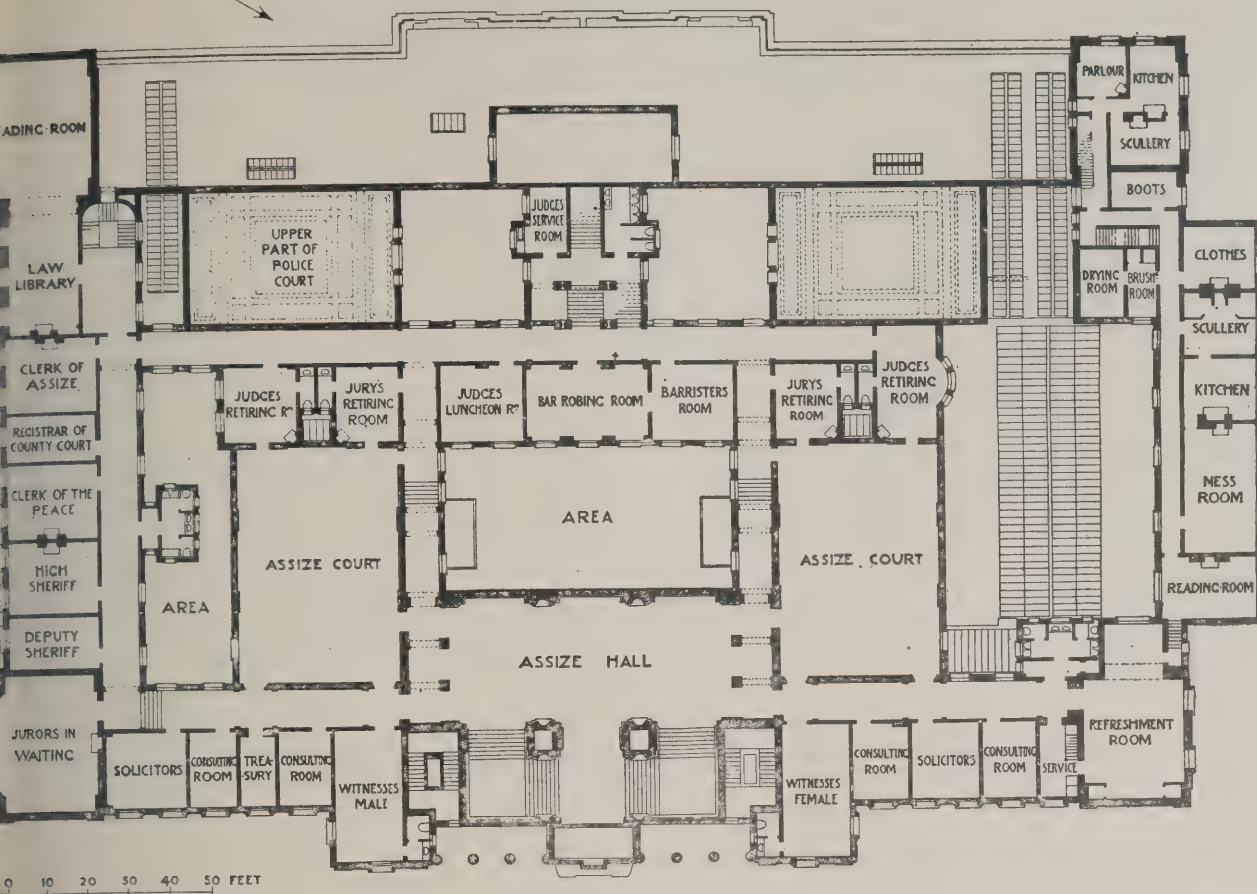

Very fortunately for us the site provided for our work at Cardiff is quite an exceptional one, and though not laid out with the skill that one sees exercised in France or Germany it is nevertheless of a noble spaciousness and liberality, so that the buildings stand four square, open on all sides, and the façades only broken by the surrounding trees. The design of the Cardiff courts was, to a great extent, governed by the relation of the building to the town hall on the east side, to which it corresponds in architectural details, and in its dimensions from north to south. This also suggested the arrangement of the assize courts and their adjuncts on an upper floor, though such a course is in this case justified on economic grounds alone.

The very general objection to the placing the courts on the first floor is to some extent met by the arrangement of the steps, those not external forming as it were part of the design of the assize hall or *salle des pas perdu*.

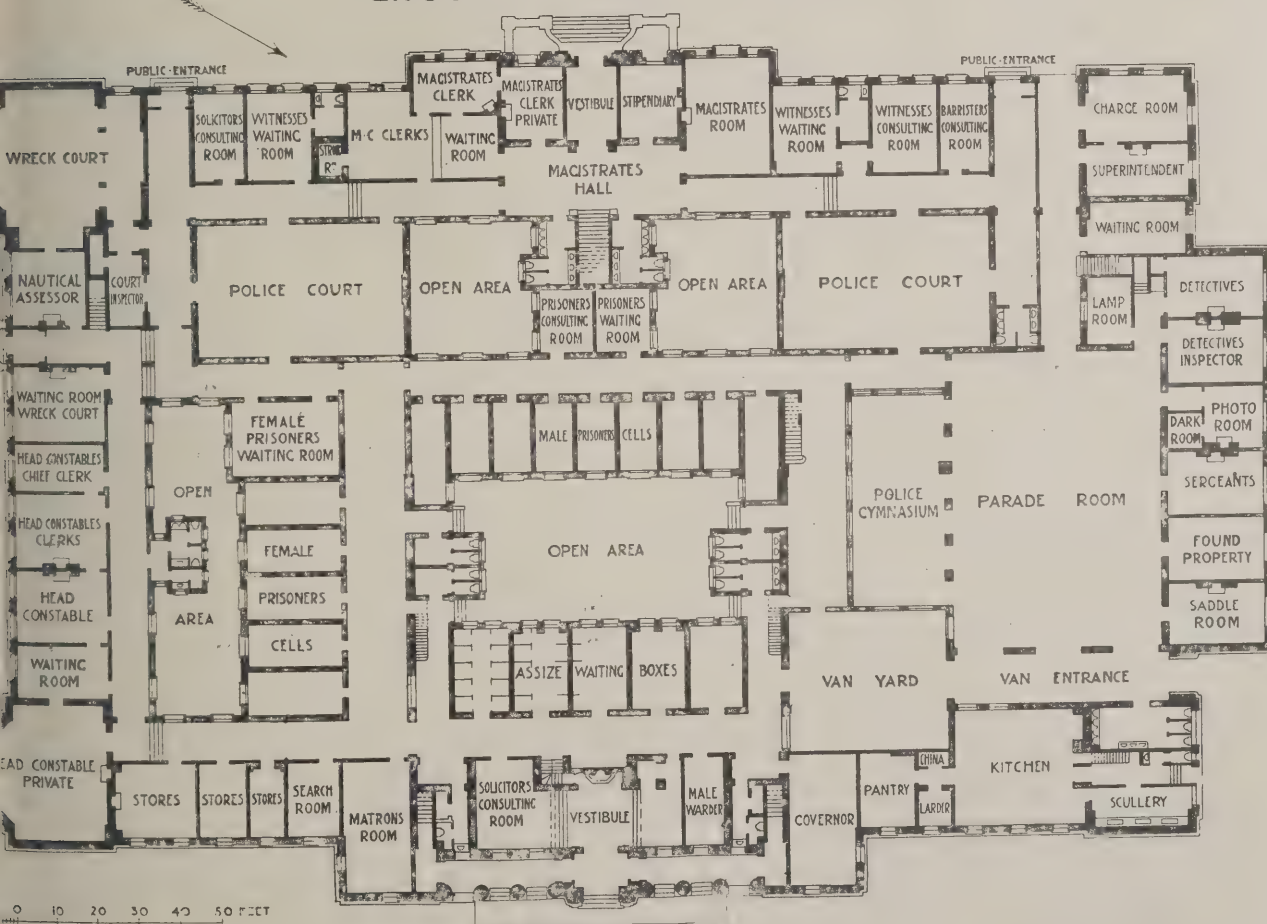

You will, I trust, understand that in illustrating my paper by means of these plans, it is not with any idea of their representing a standard type; as a matter of fact, the conditions themselves preclude such a supposition, but that such a course makes it easier for me to formulate the various points with which I ought to deal.

With the plan before us I should mention that the buildings include the following:—The assize courts, police and wreck courts, the A Division police station, the chief

• FIRST FLOOR PLAN •

• GROUND FLOOR PLAN •

constable's offices. Beyond pointing out on the plan the accommodation allotted to the two latter, I do not propose to refer to them, as they present but few variations from the usual practice. Basing our ideas on the examples quoted, it will be best to commence with the assize courts, and taking one of these and its surroundings in detail, the practical problems that I referred to at the commencement of this paper will become obvious.

We shall not then need to consider the lesser courts at the same length, as they will follow to a large extent the same principles. You have in those attending the court the following six main divisions:—(1) Judge; (2) jury; (3) Bar; (4) witnesses' solicitors (and litigants in civil cases); (5) prisoner and police; (6) public, each of which it is desirable to keep to some degree distinct, while the first two must be able to pass direct to their retiring-rooms without emerging into any of the general corridors.

You will see at once that it is practically impossible to secure this degree of subdivision on one floor, but the removal of the public to an upper gallery, and provision of steps from the dock to a lower floor for the prisoner simplifies things very much.

A corridor in front of the court will serve division 4, and also jurors in waiting and when discharged. Corridors on one or both sides will provide for the Bar and officials, while the judge enters through his private room, from suitable access provided at the back of the Bench. Thus we may mentally picture as the ideal arrangement a central block consisting of the court plus the judges' and jury retiring-rooms, surrounded by a corridor, outside which are suitably placed the various rooms for officials, Bar, witnesses, &c. Taking this as a starting-point, it will almost inevitably occur that exigencies of lighting, access, &c., will demand modifications; for instance, the courts may require to be grouped, as at Birmingham and the Old Bailey; the site may be too small to allow of all the rooms on one level, as

at the High Courts; or, again, the lighting of a lower floor may have to be considered, as is the case in our building at Cardiff. At the High Courts of Justice the officials' and barristers' rooms are very ingeniously dealt with on a mezzanine below the judges' rooms, &c., at the back of the Bench; the Bench being raised, these rooms are conveniently near the level of the court. On the other hand the jurors' retiring-rooms are not well managed, being in the basement, two floors below the court level. The witnesses' rooms are next in importance, and if it is difficult to place those in close proximity to the courts, an enclosed space may be provided at the back of the court for witnesses immediately wanted, though I think the more usual provision of a few seats in the court and a good room close at hand preferable.

The grand jury, an important factor in the conduct of our assizes, need not be in such close touch with the court as it only assembles there at the commencement of the session to receive the judge's charge and then withdraws to deal in a preliminary way with the cases. It hears sufficient evidence to decide whether a case should proceed or not, and its communications are handed in to the clerk in the form of a "true bill" or otherwise.

The grand jury, twenty-four in number, is drawn from the magistracy and more important residents in the circuit.

It is a general practice to put its rooms on an upper floor with an opening into the court by which the bills can be delivered on the usual "fishing-rod." The arrangement of our building enabled us to put a gallery in the court which would accommodate the grand jury while being charged, but it is very possible that judges will prefer to have them in the body of the court instead.

Before going into the arrangements of the courts themselves it is worth while to run through a short schedule of those for whom accommodation must be provided:—

(1) Assize Court (Criminal)	Sheriff Deputy Sheriff Judge Judge's Marshal " Clerk Assistant Clerk	Jury of Twelve Jurors in waiting	Bar	Witnesses and Solicitors Ushers Official Reporter Press	Prisoners Warders Police	Public
(2) Assize Court (Civil)	As above	As above	"	As above and Litigants	None	"
(3) Quarter Sessions (Appeals from police and petty sessions in minor cases; licensing cases)	Magistrates with Chairman of Bench or a Recorder Clerk	None	"	Applicants Witnesses and Solicitors	Prisoners and Police	"
(4) Petty Sessions (Country police court)	Magistrates or Stipendiary Clerk	None	"	Prosecutors Witnesses and Solicitors Press	Prisoners and Police	"
(5) Police Court	Magistrates or Stipendiary Clerk	None	"	Prosecutors Witnesses and Solicitors Press	Prisoners and Police	"
(6) Wreck Court	Stipendiary Nautical Assessor Clerk	None	"	Ship's Officers Witnesses and Solicitors Press	None	"
(7) Sheriff's Court (Compensation cases and assessment of damages)	Deputy Sheriff Clerk	Jury of Twelve	"	Plaintiff and Defendant Witnesses and Solicitors	"	"
(8) County Court	Judge Registrar Clerk	Jury of Five	"	Plaintiff and Defendant Witnesses and Solicitors	"	"
(9) Coroner's Court	Coroner	Jury of Twelve	" (Occasionally)	Witnesses	Occasionally prisoner under escort	"

We now come to the details of the court-room itself. Taking assize courts first, we find that the usual form of court is now a short oblong, with a width of 30 feet to 40 feet and a length of 40 feet to 60 feet; but at Gloucester the courts (erected some sixty years back) are semicircular in form, with the seating in concentric semicircles struck from the judge's throne. This arrangement seems a good

one, both practically and architecturally, and might, I should imagine, be more frequently employed where the site is suitable. We will assume, however, that the rectangular plan is adopted. After arranging for the Bench, which should be about 25 feet long by 6 feet or 7 feet of width, and raised 2 feet 6 inches to 3 feet above the floor in the court, the chief point on which any difficulty arises is

the position of the witness-box; this should not be less than 10 feet or more than 12 feet from the judge, and could again be within 12 feet or 14 feet of the examining barrister and the jury. If much further than this the witnesses' replies may not carry, and the facial expression, which is sometimes important, may escape observation. It is more usual to put the witness on the other side of the judge to that occupied by the jury, with the advantage that the witness practically faces the jury-box when under examination, but with the disadvantage that remarks audible to the barrister and judge may not reach the jury, who are generally less inclined to interfere in asking the witness to speak up. After consulting authorities of great experience we decided to place the witness-box on the jury side, pushing the latter slightly further down the court than usual, so that they get at least profile view of the witness. The witness-box should be 4 feet above the floor, and should have a small table-top for documents or other articles produced in evidence. In front of the Bench, and about a foot below it, are seats for the judge's clerk and officials assisting him, and in front of these on the floor of the court the tables and seats of solicitors, while on the opposite side to the jury-box are placed the official shorthand writer and the Press. Behind the solicitors sit the barristers, and behind them is the dock. In the court where civil cases are heard this dock is convertible into additional seats for the Bar, or for special witnesses, experts, &c., while the bank of seats at the back of the court provides for witnesses and jurors-in-waiting.

Police.—Police courts follow much the same general arrangement, with the exception that no jury-box is required, while the cases are usually disposed of much more rapidly. The public may either be in an upper gallery or on raised staging at the back of the court. The prisoners are usually brought into the dock by means of a staircase from below, but at Cardiff they come in on the level from the cells corridor which runs along the side of the courts; to our mind this is the more expeditious method. You will see that these courts are in our building approached from three sides, and that the grouping of the two avoids cross lines of traffic as far as possible in such a case.

The wreck court is presided over by the stipendiary and a nautical assessor, and deals with such cases as the name implies, those attending being chiefly engaged in the mercantile marine.

The buildings are heated by the atmospheric steam system, the steam being slightly below atmospheric pressure; the boilers are in the basement of the town hall, and pipes are brought through a subway connecting the two blocks; the courts and other rooms are supplied with fresh filtered air, driven by electric fans through steam-heating batteries, and carried by means of ducts and flues to suitable points. Extraction flues and ducts are carried to blowers in the two towers. It may interest you to hear, what I only knew myself a few days back, that this is practically the same system as was adopted in the court-rooms at Manchester over forty years ago; though, of course, many variations in detail have developed in the meantime. At all events, experience has proved that for rooms as much occupied as courts some form of mechanical ventilation is essential.

You have, I imagine, formed a fair general idea of the requirements in buildings of the class under consideration, and not wishing to extend these remarks unduly, I propose only to briefly refer to the general character which might be expressed architecturally in a building of this class.

A certain austerity should, without doubt, be the prevailing note, but this should be most emphasised in the justice-chamber itself, where the presence of ornament and useless accessories would be distinctly out of place.

The assize hall, however, presents an opportunity which is scarcely to be found in any other description of building. Severe in treatment though it should be, it is yet a link between the outer world and the solemnity of the tribunal. As it leads to the various departments, and has to provide for the freest perambulation, it includes more than one vista, and affords scope for the romantic treatment that art associates with an exchange or public loggia, where the learned might exercise the imagination and find inspiration in a sense of space and rhythmic form such as a well-designed apartment of this importance and character should suggest.

A feeling of the open air quite apart from the matter of ventilation should be imparted, and any sense of confinement would effectually mar the relief which such a hall affords those who have felt the tension of a hardly fought

case. Balconies to the open air, provided their outlook is not too exciting, would be valuable as adjuncts, and mysteries of light and shade might be sought for.

A considerable uniformity of material would seem to be desirable, such as could be secured by a vaulted room in stone with a stone floor tempered by the introduction of other materials, if they are used only in the broadest way.

Such a hall offers great opportunities of an almost purely architectural character, and the use of ornament and sculpture need not be excluded, though these adjuncts are capable of a freer treatment in the exterior of the building. It may be remembered that a palais de justice is not a prison, and that in the hands of an artist dignity and balance may achieve a result typifying the magnificence of the law, which is no terror to those who have no reason to fear it, and a palace of justice as a monument to a merciful institution might well have some elements of gaiety in its composition.

Mr. HOOPER said he rose with great pleasure to propose a very hearty vote of thanks to Mr. Lanchester for the most instructive paper that had just been read. The subject of law courts seemed to belong rather to the specialist. Mr. Lanchester was to be congratulated on the wonderful opportunity he and his partners have had in erecting the law courts at Cardiff. It might almost be said that in no other similar instance in Great Britain has the architect been subject to so few restrictions. The most notable instance in London of this class of work which has been so hampered is the Law Courts in Fleet Street. Mr. Street's design was cut down and meddled with in a most merciless manner. In consequence an amount of waste space was obtained which one cannot but wish had been devoted to building, and thereby to obtain the architectural effect which Mr. Street was so anxious to secure. In effective contrast to this cheeseparing policy one can turn to the law courts of Brussels, and marvel at the opportunity which M. Poelaert had afforded to him, and also at the brilliant manner with which it was seized. It used to be said that the building was a monument to Justice, but the King of the Belgians said it was rather a monument to Architecture. Such indeed it appears to the casual observer. Whether it fulfilled all the requirements for which it was erected he could not say. But externally, at any rate, it was a very expressive structure. The student of architecture cannot refrain from marvelling at the attention bestowed on the minutest detail. Even the fittings and furniture of the interior were carried out under the personal supervision of the architect, M. Poelaert. Paris has no law courts to compare with those at Brussels. Those in Rouen are of extreme interest, but being out of date are not within the purview of the paper under discussion.

Mr. E. A. RICKARDS, in seconding the vote of thanks, said he was grateful to Mr. Lanchester for having presented the subject under a new light to him.

Mr. GREIG said that he was struck very forcibly by the fact that Mr. Lanchester throughout the course of his paper referred to no point of historical interest. The whole question of law courts seems under its present aspect an eminently modern one. There was nothing to guide a designer as to what principles should be followed. This method of dealing with the subject was perhaps a surprise to anyone who had expected that Mr. Lanchester would include some remarks on the history of law courts and our methods of dispensing justice, and perhaps indicate the gradual development which culminated in the system of the present day, thereby affording us some guide as to how to carry on a tradition if there was such a thing in this branch of architecture. If the subject is accepted as an essentially modern one, the employment of modern materials is perhaps more completely justified than in any other kind of work. Mr. Lanchester did not enter either into a discussion as to the various materials best suited to the difficulties peculiar to this architectural problem.

Mr. E. GUY DAWBER in closing the discussion said that everyone must regret the very lax attendance on that evening, and that the paper had not provoked more discussion must be attributed to the very inclement weather. It seemed to him that the subject of law courts was beyond question one for the specialist. Mr. Lanchester and his partners have made it entirely their own, and Mr. Lanchester knows more about it than anyone in England. Messrs. Lanchester, Stewart & Rickards were to be congratulated on being able to put up two such magnificent buildings as the Cardiff town hall and law courts together. The short-sighted policy of local authorities in England when cramping the sites of municipal buildings must be a

cause of deep regret to all who could see a little ahead. This is borne out by a visit to any continental town. There the town halls were made the principal feature of the town and were enhanced by the dignity of their surroundings. The overwhelming sensation in looking at the law courts in the Strand is that they are restricted in area, for it is impossible to obtain a general view of the buildings from any point. At Cardiff, on the other hand, the buildings can happily be seen from all sides. In England, of course, it is sometimes exceedingly difficult to secure an open space for imparting the full effect to a design. But one must nevertheless regret such a fact. Mr. Dawber concluded by proposing a vote of thanks to Mr. Lanchester, which was passed with acclamation.

Mr. LANCHESTER in reply thanked the meeting for the very cordial way in which his paper had been received and for which he was very proud. He protested against the statements of two of the previous speakers when they said that law courts were for the specialist. He strongly objected to such a description, and doubted if there was such a being. If a man bestowed extra attention on a particular branch of his work he was not thereby constituted a specialist. Of course, he and his partners knew more about law courts than they did when they secured their first commission. But he declined to accept it as a compliment if he were labelled specialist, no matter of what kind. It had never occurred to him to deal with his subject from an historical point of view, and he hoped that this aspect would be separately treated at a meeting of the next session. His effort was to attentively study modern and contemporary work, and endeavour to carry it a step forward. Our modern arrangements were not like those of even so recent a period as fifty years ago. Mr. Dawber, in alluding to the cramping of the sites of public buildings, had told them by way of comfort that they could not expect free open spaces in old England. The argument was not altogether sound, for it must be conceded that most of the continental towns, where the opposite condition prevails, are quite as old, and usually much older, than English cities.

GENERAL.

Mr. LILIE FIELDS, R.A., has completed the State portrait of Queen Alexandra and has submitted it to the inspection of Her Majesty.

The Property left by Mr. George Henry Boughton, R.A., of West House, Camden Hill, London, W., who died recently at the age of seventy-one, has been valued at 24,916*l*.

The Public Works Department of the Cape of Good Hope will obtain a design for the new law courts to be erected in Cape Town by competition. The architects will be confined to those practising in South Africa.

A Joint Committee of admirers of the late Robert Brough, A.R.S.A., appeal for help in raising a fund for the following purposes, viz.:—(1) To acquire and place in the Art Gallery, Aberdeen (where the late artist received his artistic education), the fine portrait-bust of him by Mr. Derwent Wood, exhibited last season at the New Gallery; (2) to found an art scholarship in Aberdeen, to be called the "Robert Brough" scholarship.

Mr. Hippolyte J. Blanc, R.S.A., read a paper on Friday last before the Edinburgh Architectural Association entitled "The Arts of the Monastery." The numerous lantern slides included examples of his own work.

The Royal Scottish Academy rejected at a statutory meeting, by eleven votes to nine, the proposal to elect a painter, a sculptor and an architect to the rank of Associate.

The University of Oxford has renewed the annual grant of 100*l*. to the British School of Archaeology at Athens for three years.

The Ruislip District Council have decided to offer premiums of 50*l*., 30*l*., and 20*l*. for the designs submitted in the competition for the new public free library, towards which Mr. Carnegie has given 5,000*l*.

The Carpenters' Company have voted 25 guineas to the building fund of the Architectural Association.

The Royal Society of British Artists have elected the following members:—Mr. G. C. Collins, Mr. Walter Dexter, Mr. T. Hodgson Biddell, Mr. W. M. Palin, Mr. H. Lindley Richardson and Mr. D. Murray Smith.

The Annual Exhibition of the Royal Hibernian Academy was opened on Monday by the Countess of Dudley.

Mr. D. G. Hogarth is to have charge of the excavation the site of the "Artemision," which will be resumed at the end of the month.

Professor W. E. Dalby will deliver on Tuesday next the Royal Institution the first two lectures on "Vibrations and Problems in Engineering."

The Plans for the Liverpool County Hospital for Children have been passed by Wirral Rural District Council. The quantities are now in preparation. The central block will be first undertaken at a cost of about 25,000*l*.

An American Court of Appeal has decided that an engineer is not compelled to hand over to his successor books containing field notes made by him in surveying lots of individual owners upon their application, under the employment and at their expense, but such books are his private property.

The Bexhill Education Committee have decided to appoint an assessor in connection with a proposed competition for the design of a new school.

An Academy of Music is to be erected in Brooklyn, New York, at a cost of 1,000,000 dols. Several well-known architects will be selected and invited to submit plans in the competition held under the supervision of the professor of architecture at Pennsylvania University.

Mr. J. R. Bell, M.I.C.E., has removed his offices to 25 Victoria Street, Westminster, London, S.W.

The Ascoli Cope has been returned by Mr. Pierpoint Morgan to the Italian Government. The transference to Italy was effected through a secretary of the Italian Legation in London.

Mr. G. H. Willoughby, of Manchester, has been appointed assessor in the Nelson free library competition. It is believed 200 designs have been sent in.

An Office Building is to be erected in Chicago on which the total expenditure will amount to five million dollars. Half of this amount will be the cost of the site.

The Chailey Rural Council have received an account from their solicitors showing payments amounting to 267*l*. in connection with the proceedings against Sir W. Grantham. The clerk has in addition presented a bill for 68*l*. as out-of-pocket expenses.

The French Government has purchased a picture by Mr. Sickert representing Old Bedford Music Hall, Camden Town.

Clifford's Tower and Mound at York Castle will henceforth be upheld at the expense of the whole county of Yorkshire.

The Leeds City Council have accepted the resignation, on account of failing health, of Mr. Thomas Hewson, M.Inst.C.E., city engineer and surveyor and waterworks engineer. Mr. Hewson, who is now sixty-five years of age, came from Rochdale to Leeds in 1881.

Mr. Holbrook Gaskell will give 1,000*l*. towards the erection and complete furnishing of an operating theatre in connection with the Liverpool Country Hospital, which is about to be erected at Heswall, Cheshire.

Mr. T. G. Jackson, R.A., will on Thursday next, at five o'clock, deliver the first of his course of two lectures at the Royal Institution on "The Reasonableness of Architecture."

Mr. J. H. Mawson, garden architect, has taken an action against the Carnegie Dunfermline Trustees, claiming 3,101*l*. 11*s*. 2*d*. for services in connection with the improvement scheme. The trustees have offered 300*l*.

The Birmingham Association met on the 10th inst. to consider the question of registration. The following resolution was adopted:—"The Birmingham Architectural Association having listened with great interest to the addresses of Messrs. Cross and Hubbard upon the subject of 'The Statutory Qualification of Architects' hereby records its approval of the general principle they advocate, and wishes them every success in their endeavours to bring about, through the most appropriate channels, suitable legislation upon the subject."

Her Majesty's Theatre, Carlisle, which was destroyed by fire some months ago, is in process of reconstruction. The seating accommodation of the new theatre will be as follows:—Private boxes, 14 persons; dress circle, about 100; upper or back circle, 152; stalls, 132; pit, 560; gallery, 572—total, 1,530. The frontage of the old building, which was not damaged by the fire, will remain. It is expected that the theatre will be ready for opening in the autumn. Messrs. W. H. Bendle & William Hope, 33 Grainger Street West, Newcastle-on-Tyne, are the architects.

The Architect.

THE WEEK.

THE new Workmen's Compensation Bill, which will have to pass through the House of Lords before being submitted to the House of Commons, corresponds to a large extent with the report of the departmental committee issued last year. It was recommended that the limitations in respect of employment on or in or about any building, as regards height of building, use of scaffolding and employment of machinery, be repealed. In the Bill there is no longer a necessity for restricting accidents to those which occurred on, in or about any building which exceeds 30 feet in height, or on which scaffolding is employed or machinery used for the purposes of construction. Men engaged in preparing the ground or laying the foundations can claim compensation. Another recommendation was that the words "dock, wharf, quay, warehouse" should be inserted after the word "factory." That has been done, and the Act will also apply to tramways, workshops and laundries. An accident which occurs while a building is being decorated or altered in any way can also be made a subject for compensation. The committee furthermore considered that a workman should not be prevented from recovering compensation by reason only of the fact that the accident did not occur on, in or about a particular place. The Bill proposes to extend the obligation of the employer to cases where the accident happens to the workman while actually engaged on the duties of his employment although absent from the premises of the employer. The dependants who received compensation are such members of the workman's family as were wholly or partly dependent upon his earnings. In the Bill dependants include "wife or husband, father, mother, grandfather, grandmother, stepfather, stepmother, son, daughter, grandson, granddaughter, step-daughter, brother, sister, half-brother, half-sister."

VISITORS to the Paris International Exhibition will remember that in the Petit Palais a pleasing effect was achieved by covering the ironwork with mat gilding. Gilding on metal may be false in heraldry, but in decoration it is generally advisable. The palace now belongs to the City of Paris, and the Municipal Council have added it among the other structures which have to be devoted for the benefit of visitors in the summer. But though a penny-wise policy which is unworthy of the city instead of regilding the ironwork it is being covered with ordinary paint. It is not often such a lack of taste is exemplified in a public building in Paris, and the gain is so insignificant as not to be worth consideration.

ALTHOUGH the St. Louis Exhibition of 1904 has ended with financial losses to others besides the promoters, the exhibition must in many respects be considered successful. The buildings demonstrated American expedition both in the designing and the construction. Mr. ALFRED FLETCHER read an interesting paper before the Institute on the buildings. The book he has issued, of which Mr. BATSFORD is the publisher, gives more information than was possible in a paper, besides a great many photographs of the buildings and grounds. The information contained in the pages can be turned to account for other purposes. What must strike every architect on examining the plates is that Old World architecture has been employed throughout, and that the building is suggestive of an independent effort to employ novel forms. Mr. FLETCHER explains this by saying that "so thoroughly has the Beaux-Arts captured the imagination of American architects that none could get away from its influence even in erecting a temporary building." Evidently the American "Young American" has not yet appeared in architecture.

AN exhibition of paintings by HENRI LEYS and his nephew, HENRI DE BRACKELEER, will be held in the New Museum, Antwerp, from May 15 until June 15. LEYS, who lived from 1815 to 1869, was one of the great masters of the modern Belgian school. His style was imitated to some extent by his pupil, Sir ALMA-TADEMA, when he preferred Mediæval to Classical scenes. LEYS might be described as a Mediæval realist, and his paintings are very different to the masquerades of modern models in fancy dresses which are supposed to be historical paintings. If LEYS painted Mediæval buildings his style would seem from be in keeping with the architecture. But the severity of his manner is not always pleasing, and his pictures appear almost out of place in a modern gallery. HENRI DE BRACKELEER also loved the scenes of a past time, but he was not an archaist, and his colouring appeals to modern eyes as if it were superior to his master's. Both artists produced admirable works, and a sight of them will repay a voyage to Antwerp.

WE lately referred to RUDOLF VON ALT, the NESTOR of the Austrian painters. In spite of his age, he was so young and ardent in temperament that he was elected to be President of the Society of Secessionists, or the advanced painters who were in revolt against the old methods of the Austrian school. He died on the 12th inst., and, as he was born in 1812, he was in his ninety-third year. He was specially successful with landscapes and representations of Austrian buildings. His water-colour drawings were highly valued. He was a link between past and present, and it was remarkable to find so old a painter in the van of progress. No artist in Vienna was so popular with young aspirants as RUDOLF VON ALT.

THERE is no country in Europe where the French proverb "Aide-toi, le ciel t'aidera," deserves to be accepted and acted on as in Ireland. What can be done by self-help under adverse circumstances has been exemplified in the attempt to obtain examples of modern art for Dublin. In the first place the committee succeeded in obtaining for exhibition the collection of French and Dutch paintings which belonged to the late Mr. J. STAATS FORBES. They were better adapted than any discourses to convince the people that modernity in art has its importance. Energetic efforts were made to raise subscriptions for the purchase of some of the works. On Monday last the treasurer was able to announce that the money already promised amounted to within 840*l.* of the sum required to purchase fourteen examples of COROT and nine of CONSTABLE from the Forbes collection, and that various other pictures in the exhibition had been presented. It is difficult with such a collection to allow any part to leave Dublin, and the other works which are considered necessary will cost 5,800*l.* It is proposed that an attempt should be made to borrow that sum, at a reasonable rate of interest, on the security of the pictures and the names of certain members of the committee before the exhibition closes. Time to collect the money would be given by such an arrangement.

A PAPER was lately read in Bonn by Dr. SIEBOURG on an ornament for the dead which was obtained from an ancient Greek tomb. It is made of a very thin pale gold, and was used as a band for the head of a corpse. The inscription on it is to the following effect, "Be consoled, EUGENES, nobody is immortal," as if it were the last greeting from a relative or a friend. Similar inscriptions are found on steles and must have been of ancient origin. The name Taenia was applied to streamers on ships and to the string used for tying garlands; it was also applied to a band for the hair. Priests and priestesses wore one, and it was sometimes intertwined with the chaplets of olive and laurel for prophets and poets. It was not supposed to be employed for the dead.

BUILDINGS IN CHANCERY.

ACCORDING to JOHN SELDEN, there is no land in England which can be described as allodial, or held of nobody, for "all the land of England is held either immediately or mediately of the King." If we believe theorists, the greater part of the globe was once treated as collective property, but in course of time there was a change which in Western Europe was presented as feudalism, through which there was no land without a master. Afterwards in England the feudal tenants became freeholders and copyholders. Finally there was landlordism and tenancies of various kinds. In England it may be supposed that the holding of the land from the Sovereign is only a legal fiction, but in practice it is found to be of great importance, and is essential to the State.

One result of the principle or the fiction, whichever we like to call it, is that with us property has become sacred and inviolable. This state of things is so familiar that we look on it as if it were a law of nature. But philosophers in all ages have been doubtful about individual rights to property, and one of them, a Frenchman, wrote an elaborate treatise demonstrating that private property ought to be allowed to exist. Many political societies abroad take an opposite view, and will not believe in individual privileges. MIRABEAU suggested the opposition to the possession of land when he said:—"If every man that ever lived had a tomb, it would be necessary, in order to find land to till, to overthrow these monuments and to disturb the ashes of the dead in order to nourish the living."

One of the consequences of the belief in the seigniorial privileges or visionary proprietorship of the Sovereign with respect to the property held by his subjects was that the Court of Chancery, which was closely connected with him, became the guardian of property in various forms. Its powers are not easily defined. DICKENS described the Court as having decaying houses and blighted land in every shire, and, indeed, it might be said without exaggeration that there is not an acre of land in England which at one time or another did not come within the purview of the Court. The complaints raised about its arrears, which sometimes seemed to be fabulous in number, were evidence of the extent of its transactions. In CROMWELL's time the Parliament found there were 23,000 causes awaiting judgment from periods ranging from five to thirty years, and it was resolved to abolish the Court. There was, however, no change; we suppose it was found on reflection that the consequences would be more dangerous than the evils which then existed.

In dealing with property the Court, or as it is now called the Chancery Division, is not confined to large landed estates. It also takes cognisance of all buildings upon estates, whether mansions or cottages or farm buildings. Building in general would lose some of its importance if it were exempt from the control of the Chancery Division. That is only reasonable, for a fine estate would have a diminished value if a residence on it had fallen into ruins. The extent of the power of the Court over buildings was exemplified in a case heard before Mr. Justice SWINFEN EADY this week.

Lord KENSINGTON is the tenant for life of the St. Bride's estate, in the county of Pembroke. The rental value is about 7,000*l.* a year. But there is also property in the form of investments which yield over 11,000*l.* a year. The mansion-house is not, however, worthy either of the owner or of the estate. It is one of those castellated buildings having a tower and battlements which were in fashion about seventy years ago. It was built for show rather than for comfort. There was a large hall and a grand staircase and a gallery, but visitors were not expected to stay, for there were very few bedrooms to accommodate them. As was to be expected at that time in a great house which stood apart from the highway, the sanitary arrangements

were of a primitive and disagreeable kind. A cesspool received the drainage, and it was placed in such position that the odours from it filled the house. The water supply was scanty, and was only obtainable by hard work in pumping.

Existence under such conditions would not be allowed where sanitary Acts are enforced. Lord KENSINGTON therefore desired to have the house adapted to modern requirements and the dangers removed. An ordinary person would have no difficulty in doing so if he possessed the money which was required. But a tenant for life is not free to act as he pleases, and Lord KENSINGTON had therefore to apply to the Chancery Division to obtain such an allowance from the funds in the hands of the trustees of the estate as the law allowed. By the Settled Land Act one-half of the annual rental derived from the land can be applied towards rebuilding a mansion-house. But in the present case it was a question whether the works to be undertaken could be considered as rebuilding. In the schedule which was submitted to the Court the works were described as rebuilding, viz.:—(1) The rebuilding of the principal mansion-house at St. Bride's, 12,700*l.*, the principal works required therefor being as follows: (a) Removing attics and reconstructing roofs, (b) adding an additional storey to back building, (c) building three storey addition at back, (d) altering gun-room, adding two storeys to north-west side with additional sanitary accommodation, and providing hot-water system, (e) providing heating apparatus, (f) altering vents and building chimneys, (g) converting kitchens, &c., in dining-room, constructing oriel windows, rearranging corridor and providing two new sitting-rooms, (h) rearranging upper floors and carrying-up hall to roof a building tower and tower-room, (i) building laundry and washhouse for mansion-house, (j) electric light for mansion-house; (2) new drainage system for mansion-house, 300*l.*; (3) new water supply for mansion-house, 1,400*l.*—total, 14,400*l.*"

From the foregoing document it will be evident that a transformation was demanded. We are enabled from it to realise the imperfections of one of those mediaeval castles which were supposed to be adapted not only for the nobles and peers, but for those who aspired to that rank. The influence of the existing building would also appear to have dictated the character of the alterations. Instead of a complete clearance and the adoption of a modern common-sense style, some of the characteristics of the old building are to be preserved, although none of the walls may remain. It was argued that the house was not to be rebuilt, but to be altered and to be added to. The judges are sometimes in doubt about the difference between rebuilding and altering. Mr. Justice SWINFEN EADY at one time considered that what was contemplated was only alteration and addition, but on the last occasion he concluded there was to be a rebuilding. As guardian of the property he appeared to be satisfied that the new house would not be more expensive to keep up than its predecessor.

The question then arose how much money could be granted out of capital towards the expenses. Assuming that the net income was 17,000*l.*, his Lordship followed the Settled Land Act in granting 8,500*l.* Lord KENSINGTON has undertaken to carry out the other works included in the schedule. The estimated cost for a new water supply was also allowed for by the Act.

A case of the kind would appear strange to a foreign jurist. The Chancery Division has to take into account not only the present but the future. Throughout the discussion the interest of the tenant in tail, who is not yet a year old, received as much consideration as the interest of the present holder of the estate. That concern for another generation occasionally leads to remarkable results. The late Marquis of Bute was compelled to obtain a special Act in order that he should be repaid 1,000,000*l.* in return for the vast outlay on docks and other improvements at Cardiff. To the trustees his Lordship was merely one individual of

possibly numerous race, and his interests were therefore only of a fractional kind.

When cases arise which relate to architecture there could be an advantage if a Judge could be aided by the views of an architect or assessor. In Chancery there is always a respect for anything which is ancient in its origin. In consequence, styles of building which may be obsolete are respected. A few years ago trustees had to suffer because they built houses in Bedford Park in a form which was novel at the time. When it becomes a question of rebuilding and alteration an architect is likely to apprehend that the Court will only give sanction to a new building which is suggestive of the old. Then planning becomes cramped and there is a risk that convenience will not always be attained, and that future occupants will have to suffer through the reference which is given to forms and arrangements which have come from an earlier time. The principle, however, of the Court, which is opposed to HERBERT SPENCER's dictum that equity does not permit property in land, is so important for the continuance of Great Britain, we are bound to undervalue the slight inconvenience which may occasionally have to be endured by individuals.

COMPOSITION IN PAINTING.*

VISITORS to exhibitions of paintings in England are aware that the most admired works rarely consist of more than a few figures. This fact is also proved by the engravings or etchings which are published. MILLAIS is known by such dualities as the *Side of Lammormoor*, the *Black Brunswicker*, the *Princes in the Tower*, the *North-west Passage*, the *Described Royalist*, and the *Huguenot*. Occasionally there are three figures, as in the *Rosalind and Celia*, the *Order of Release*, and the *Rescue*, but as a rule the most admired works are confined to one or two figures. The practice was hardly less remarkable with WATTS. He was ambitious, and was eager to display his power in overcoming difficulties, but most of the paintings which were to be seen in the Winter Exhibition were as limited in figures as those of MILLAIS. Equally noteworthy was the practice of WHISTLER.

Whether this disregard of several figures is to be attributed to the love of portraiture which prevails in England or to the difficulty of grappling with composition we need not inquire. Few modern engravings have been more popular than those of GUSTAVE DORÉ, which are representations of crowds, and in a lesser degree the engravings from EDWIN LONG's *Babylonian Marriage Market*, *Egyptian Feast* and the *Spanish Dancing Girl*, in all of which many figures appear, have been successful. Certain paintings of State functions, of battle-scenes and the like have also been admired. But every exhibition it is demonstrated that the majority of painters believe that pictures with a few figures are more likely to be appreciated by the multitude than those in which a great many appear. The President of the Academy sets the example. He would, no doubt, prefer his *Israel in Egypt* and the *Queen of Sheba* are pictures by which his reputation is to be sustained, and in ordinary years he is satisfied with a nymph in a cave or a Roman lady looking out of her window. There are some critics who will say that the system is mainly owing to incompetence. Composition is supposed to be exceedingly difficult, and receives scant attention in the training of artists. But it should be understood that in the representation of a head some attention to composition must be given. It is only necessary to look through a collection of coins or of postage stamps in order to see how much effect is gained by the relations between a head or an emblem and the

boundaries of the space it occupies. Indeed, in all great pictures we find that the disposition has some connection with an imaginary geometrical outline. In a great many cases the relation may be too manifest, as was the case with many of the old "machinists." As FUSELI says:—"Composition, like all other parts of style, had a gradual progress; it began in monotony and opposition, emerged to centre and depth, established itself on harmony and masses, was debauched by contrast and grouping, and finally supplanted by machinery, commonplace and manner." But when the cone, the pyramid, the globe, the oval, the circle or the segment become too obtrusive, then the figures, however excellent, are undervalued, and the whole painting is supposed to be a mechanical production, mere "art by geometric rule." For that reason many authorities have set themselves against composition as it was understood by the Italian masters, and as it is still believed to be taught in academies.

Courage is therefore manifest in Mr. HATTON's endeavour to explain the rules of figure composition. His book on figure drawing contained much useful advice to students of art, and his new volume is an excellent supplement to it. But the subject being more difficult, what he says may not be manifest on the first reading, and it might be supposed that originally the pages formed only parts of lectures in which *viva voce* explanations were given. The author is sometimes inclined to be paradoxical, but it is only in the intention of impressing his rules on the student's mind. The first part relates to architecture in reference to decoration, for indeed we may presume that composition arose out of the necessity to have a correspondence between the groups and other parts of the picture and the space which it was to fill. Considering the number of mouldings, the pilasters, columns and other efforts to break up the monotony of surface which is found in Classic architecture, the following may be taken as expressing the views of a decorator:—

Classic architecture is a projected architecture, just as Gothic is recessed. We find this in numerous instances of the placing of architectural members, somewhat resembling complete little buildings, upon the wall and projecting before it. These projecting members are connected together by their mouldings being continued along the wall. This is, indeed, another way of describing the broken entablature and the broken plinth, which give projections without undue weight.

In an Italian church the so-called projected architecture became a necessity, for instead of having deep chapels with altars, as in Gothic buildings, only a slight recess was necessary and it was emphasised by columns and a pediment. Each of these altars afforded an opportunity for decoration. Sometimes fresco was used, sometimes easel pictures were employed, and in both there was subserviency to the architecture. When easel pictures were employed for secular adornment they were made to present some of the characteristics which were necessary when used for the decoration of large buildings. When an architectural setting is not obtainable, Mr. HATTON suggests that a substitute is to be found in "an adaptation of nature, and use of sky, trees, and all the accessories of existence, or we can arrange our figures among ornament." There is, however, no arrangement equal to architectural forms. We have only to imagine such a work as DELAROCHE's *Hémicycle*, with trees or ornaments instead of the colonnade, in order to realise how much the work would lose in effect. The same result would follow with LEIGHTON's two works in the South Kensington Museum if the architectural accessories were removed.

Mr. HATTON has some useful remarks about filling spaces. He explains the radial method, the oval method, the starlike, circular, and the crescent or moonshaped. An admirable illustration of the last is given, viz. the "King War-wolf," by the late FREDERICK SANDYS. The king is meeting his death in the burning boat used in many adventures. The poop is curved and the lines

*Figure Composition. By Richard G. Hatton. (London: Swan & Hall.)

of the flames are in keeping with it; the chain armour he wears, his hair and beard, the armorial bearings on the sail are all crescentic. The only drawback is the overcrowding of the detail in a limited space, and in consequence the ingenuity of the artist is likely to be overlooked. It is not, however, with northern heroes that the theory of art is generally concerned. Academicism still has a weakness for Greek and Roman mythology. An engraving is given after a picture by TINTORET, which bore an inscription to the effect that if the spectator wished to know the meaning of the picture it was *Mercury and the Graces*. On this Mr. HATTON offers the following remarks:—

The Classic figure is nothing more or less than the delineation of a body capable of easy and equal action—the form arising from the possibilities of action. It is a perfect body, without differentiation, without individualisation. No one who has made any study of Greek art will hesitate to say that the Greeks carried the treatment of the figure to the highest perfection. It cannot be claimed that they gave to their figures the expression of the soul, but so far as the rendering of the body with the greatest beauty and nobility went, they succeeded as none have, since. The explanation seems to me to be this. The Greeks separated man from man, according to his actions or his fortunes. Fortune and misfortune are the outside actions bearing upon the individual, and are consequently of the same nature as his own actions. It is true they granted men passions—Ajax is hot-tempered, recklessly bold, Ulysses is crafty or wise—but in each, as in all cases, the attitude towards life is the same. The healthy, well-developed man pursues the ordinary course, swayed by this or that, defending or opposing divinity, and battling with these, or taking advantage of those, accidental circumstances. It becomes, therefore, the exploit that makes the man, who is identified by the emblems appropriate to his several ventures. Otherwise all men are alike—a little heavier limb for Hercules, a slenderer form for Mercury, activity and strength for Mars, and so on. Now, whether this be true of the delineation of personages in Greek literature, it certainly is of their representation in art. It were idle to say there were no expression in Greek sculpture—in Scopas particularly; but is it expression after all when compared with the work of, say, Donatello or Rodin? It is not. At the best it is pure physical expression, not emotional, or even if we grant that, it is the expression of emotions common to all men, though the circumstances give some degree of special intensity—as in the Laocoon. All the gods, heroes and men of Greek art would act in the same way upon a given occasion, assuming that their distinguishing characteristics did not interfere, but in the art of more recent times the individuals would act differently even when all conditions were equal, for it seems a postulate of modern art that the characters shall be so drawn that they will appear of a temperament and nature different on all occasions from other men, while the postulate of Greek art seems to be that personages are the same, except for casual variations.

Mr. HATTON employs a large number of reproductions of old prints and etchings after famous paintings to reinforce his explanations. In some cases there is a transposition of the figures in order to suggest an improvement or the superiority of the original over any alteration. The reader is, however, made to feel that there can be no cast-iron system of composition, for even within specified limits imagination can assert itself. The book will be useful not only to students of art, but to visitors to exhibitions who wish to understand why a picture is admired or condemned.

Sir R. Melvill Beachcroft has given notice that at an early meeting of the London County Council he will move that Trafalgar Square stands much in need of improvement, and might, at very moderate cost, be made as attractive as a place of public resort occupying so important and central a position in London ought to be, and that it be referred to the parks and open spaces committee to consider and report what, if any, proposal can properly be made on the subject to the First Commissioner of His Majesty's Office of Works.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Belcher, A.R.A. president, in the chair.

Sir Wm. Richmond, K.C.B., R.A., Mr. Alfred East, A.R.A. and Mr. Solomon J. Solomon, A.R.A., read papers on

Decorative Painting.

Sir WM. RICHMOND, in his opening remarks, referred to the ties which united the arts of architecture, sculpture and painting. The votaries of architecture were builders who designed and erected, sculptors who designed and carved, painters who enlivened its severe spaces with the glory of colour, craftsmen who brought glitter and sunlight into its darkest nooks as rays of light into a cavern. Late in history architecture had wished to go alone. Hence arose the danger that ornament might be stereotyped and of trade manufacture, painting cease to be its magical charm, and sculpture be relegated to an independent and solitary mission. But a return to a healthy union of the arts was in progress—thanks in a large measure to the Institute which, more than any other artistic institution in Great Britain, was encouraging "fraternity" and taking more and more sculptors and painters into its confidence and within its ranks. Hence the Institute was becoming stronger, broader in view, larger in artistic enterprise, and the sculptors, painters and craftsmen whom the Institute had honoured by electing among them were gratified. The great traditions which bound the past architecture, sculpture and painting had been kept alive by a few serious workers who did not believe that a new art was possible, any more than that a new man could be created. The great principles which had made art to the highest factor in true civilisation would grow in usefulness as their exponents gathered together in closer bonds of sympathy. Union is strength. They had to educate an inert public to use their higher faculties, to cultivate the observation and enjoy in peace what was permanent and beautiful.

Coming to the special branch of the arts he was to discuss—viz. decoration, which included mosaic and mural decoration—the author said he feared that the delightful method of "buon fresco" was for the present an impossibility to pursue in London owing to the vitiated atmosphere produced by disintegrating acids which were destructive of lime; but in the country, where pure air was obtainable, "buon fresco" might be adopted for interiors with as much security as in Italy in times past. Provided there was no poison in the atmosphere, damp was the only enemy of fresco. The author gave particulars as to the preparation of the walls to be decorated, what materials to use and what to avoid, the method of applying the colour, &c. To be successful all preliminaries, studies and cartoons must be absolutely certain both in their relation to design, forms and colours, so that the painter when he paints has only to think of his difficult but most fascinating technique. Subdivision of the various stages of development must rigidly adhered to.

Mosaic is as adaptable to exterior as to interiors, but to be effective mosaic must be used lavishly, as in St. Mark's in Santa Sophia, and in many churches and chapels at Ravenna. But mosaic demands another kind of design and drawing from any other material for decoration. The translation of pictures into cubes is obviously absolute. Mosaic can do what no other method is capable of, but cannot imitate except inadequately. The design must be clear, the drawing severe, the accidents few, the light and shadow rare. An architect should build for mosaic decoration if he intends to use it. He should give plenty of domes, semi-domes, alcoves, because mosaic looks best upon curved surfaces, where it is least likely to come in competition with pictorial design. A building to receive mosaic should have few mouldings or frames; the framing of mosaic pictures should be executed in mosaic, and strict courses as well as mouldings should be so designed to be in harmony with the style which is essential to mosaic, and that is severe. If the architect decides to make a sumptuous piece of coloured decoration, he and other artist, his coadjutor, must work together, from the first initiative to the last point of completion, if the final result is to be severe and homogeneous. The architect must consider his decoration while he is initiating the plan for his enterprise as well as the elevation. In a well-built mosaic the construction is never hidden or the joints concealed. The mosaics that look best from a distance have a good wide joint between every cube.

The next best method for wall-decoration to "buon fresco" is tempera painting upon a dry wall of lime and marble dust. The tempera used is the yolk of egg only, not the white. When dry this becomes as hard as the hardest varnish. The yellow tint gives a very agreeable tone to the white lime. Almost all colours can be used with egg. Egg-painting has stood the test of time; many of the wall-paintings at Pompeii are alone in egg, and all the tempera pictures and wall-paintings in Italy which are not fresco or wax are painted with egg tempera.

Wax-painting is another method well suited to our climate. The method, technical details of which were given by the author, may be seen in the National Gallery exemplified by portraits on wood of the second century B.C., and in many of the wall-paintings at Pompeii and Herculaneum. The author said he had tested some Egyptian wall-paintings and found that they were executed in wax and spirit. Wax-painting is perfectly durable on a wall, but not on canvas. In England it would be advisable to burn the wax well into the wall with artificial heat.

Oil-painting should be entirely abjured in decoration.

All decoration should be done upon the wall where it is subjected to environment, and not be applied. Notwithstanding personal discomfort, painters should execute their works *in situ*, even in a dark corner, because that dark corner is the place of the picture, which, if painted in full light of a studio, will be quite disappointing when it is placed in an obscure light. The same law of fitness holds good as regards sculpture. A statue designed to be set in a niche should belong to it and to nowhere else; more, it not only belongs to its immediate but to its less immediate surroundings also, and is out of place away from there.

Treating of colour in architecture, the author said that, being unaccustomed to it in modern times, prejudice was strong. Some would doubtless be shocked if they saw the Parthenon, Westminster Abbey and most of the English cathedrals highly coloured; but there is no doubt that they are, and, further, that uncoloured buildings are of modern invention, dating from the late sixteenth and early seventeenth centuries, at the period when both sculpture and painting were growing away from structures to the detriment of all the arts. The geometric or architectonic treatment of pictorial design in England has been extremely rare. All designs, from Giotto to Raphael, either in fresco or tempera, are decorative in the distribution of masses of colour, of shapes of silhouettes; they are more or less conceived geometrically, however cleverly the geometry may have been concealed. The early English decorators are extremely interesting colourists—the decoration of the Angel Chapel in Winchester is an admirable example. It consists mainly of pale, middle and red ochres and white. The author thought that the tone which appears to be blue from below is composed of nothing but black and white, which among warm tones is a mixture which produces a very gentle and refined blue. Judging from the specimens that remain, the splendour of the celebrated wall-paintings in Athens has not been exaggerated by historians.

Mr. ALFRED EAST, A.R.A., took for his branch of the subject "Landscape-Painting as a Medium of Decoration," and showed that it had been almost ignored as a medium of decoration. The architect, like the figure-painter, had put it strictly in the background. He put the question seriously to architects, Is there no room for landscape-painting as a medium of decoration? Would it hinder the design and intention of the architect to use it to decorate his buildings? Could not it conform to all his conditions as to scale and colour? Nature has an unbounded range, from winter's snow to the full rich tones of the autumn, and even these seasons she offers an inexhaustible supply of beautiful and suitable arrangement of form and colour. The architect may desire a certain colour arrangement to complete the object he has in view; he never thinks that he can find what he wants in landscape. He has the right to demand certain conditions as to scale. To accept those conditions, to work within them so that there is no apparent loss in so doing, is in itself an artistic accomplishment. The architect has no reason to fear that in the adoption of landscape he endangers any of these principles; he can find in such decoration the sentiment of his architecture, the purpose of its being. If he has built a temple of worship there is absolutely no reason why the walls or windows should illustrate the lives of the worshippers. There are things in nature which suggest a lofty purpose in their creation, and which reveal the high purpose of the Creator. There are also the materials in

nature by which the artist can convey a sentiment as pure, as high and as noble as a composition of figures could do. An architect would not tolerate any loud assertiveness of decoration whose anecdote completely distracted the attention of the spectator from the fine proportion of his building. He was not annoyed like the painter when the spectator remarked, "What a beautiful frame!" Nothing should hinder the conception of perfect completion wherein all the arts which are employed for a final end should sing together. A building was artistically complete where everything was in its right relation, where all the values were just. The author contended that his claim for the consideration of landscape-painting as a medium of decoration was that it could conform to give high purpose, and that it did conform to give just demands.

Mr. SOLOMON J. SOLOMON, A.R.A., first dealt with certain objections raised by architects when discussing decoration. With regard to the argument that the finances at the architect's disposal did not admit of the inclusion of the painter's art into his schemes, he suggested that as the edifice would outlive its author he might be permitted to provide for its future. Take a building of a national character: he should be permitted to allot some spaces to indicate to future generations the lines upon which the work should be carried on; in fact, broadly to indicate the kind and style of decoration he would have others introduce. Another fault found was that our variable climate played tricks with existing canvas decorations, causing them to sag and loosen. The fault lay with the use of too large a surface of canvas, when sometimes the architectural features which should be real are imitated by the painter. When, as on the great ceilings of the Doge's palace, a vast panelwork was designed to contain pictures of varying shapes, such as oval, octagonal, oblong, square and others conforming to the spaces of the interstices left when the surface of painting is but a third of the whole, little real danger would result. Again, few practical men would use a fresco ground for painting when the "mat" surface, its chief quality, can be obtained by the use of suitable mediums, and when far greater richness of effect can be produced by other methods ready to our hands. In France most public buildings are decorated by the painter, and none of the technical troubles complained of here were apparent. The author asked the attention of the Institute particularly to his suggestion for the promotion of a school of decoration, not with the object of competing with existing schools, but of supplementing them. His idea was that it should be a school common to the architect, the sculptor, painter, glass designer and wood-carver, for the use not only of the advanced student, but equally for the full-fledged craftsmen in the various arts who desire a special training in the arts of decoration. Professors there would be representing all the branches concerned to lecture and to teach. Studios furnished with reduced models, or studios of pictorial decorations in their settings, applied sculpture, glass, woodwork, &c.—all conceivable facts, measurements, scale, proportions, anything and everything for the use of the student that could be collected, carefully tabulated and arranged. The creation of travelling student-ships, enabling students to travel in pairs—an architect with a painter, an architect with a sculptor, and so on, with provision to make reduced copies of fine examples of art in their settings—the results going to enrich the school collection, so that by degrees these models might replace the photographs or other less useful authorities. The author went on to prove the necessity of such an institution, and the possible advantages that would accrue from its establishment. In these days of innumerable styles of architecture a wider range of architectural knowledge and of cognate decorations is imperative. Most decorative pictures are built upon architectural lines, and more often than not architectural features are abundantly introduced. At the school proposed the architect student would work in the company of sculptors and painters. Each would learn to sympathise with the aims of the others, and so in later life be prepared to work, as they should, into each other's hands. A decorative school, to which almost every painter and sculptor should go for at least a year after his usual training was completed, would react most beneficially on the general art of the country.

Sir ASTON WEBB, R.A., said he had no idea that he would be asked to propose votes of thanks to the authors of the papers. There was only one thing he could speak of with certainty, and that was that they had all enjoyed a most enchanting evening, thanks to the three gentlemen who had favoured them with their papers. He thought,

however, that the papers were too short, and that they might have been extended to double their length. He was afraid that it might be laid to the door of architects that they had not given the opportunity for decorative painting which had lain in their way. If that was so, it had been shown that evening that there was a desire to alter such a state of things. On the other hand, he thought all would admit that in England—and in that damp country of theirs—there had been great difficulties in the employment of decorative painting. Sir William Richmond, whose knowledge he supposed was such as to be beyond dispute in that particular branch of art, had given directions which would be invaluable to them. They would have those directions printed in their Proceedings, and he understood from Sir William Richmond that there was a tempera which could be used in England with certain results. Many of them would remember how, after twenty years, the decorated work by Watts on the wall of the chancel arch of St. James the Less in Westminster had become invisible. He had no technical knowledge of the medium in which it was painted, but when failures of that sort occurred it made not only the architect but also the client hesitate a little before adopting such methods of decoration for buildings. Sir William Richmond had referred to the increased alliance of the three arts, and he, the speaker, was sure he was only saying what they all felt, that a closer union was the desire of all architects. They were not assertive persons, and there was nothing they would like better than to have their walls painted by painters of ability, and he felt that if they were to obtain the co-operation of those painters and sculptors that the architects must see that their buildings bore the print of the day, and that they must impart to their architecture such vitality as would inspire the sculptor and the painter. They must also remember not to stand too much to the work of the past. English painters in Hogarth's time certainly painted large spaces, and Hogarth himself, as they all knew, painted the great walls at St. Bartholomew's, which remained to the present day. In Soho one could go into what were now very poor houses and find whole staircase walls painted from top to bottom. He was not sure that painters were now so ready to paint staircases as they were in those days. Very likely that was the fault of architects, and if it was so he was sure the profession were prepared to try and alter it. There was a great opportunity for painters in the Roman Catholic Cathedral at Westminster, and they looked with a little anxiety, but with great interest, to the way the painters of England were going to finish that building inside. Sir William Richmond referred to a matter which had importance in their work, and that was the matter of joints. The desirability of showing the joints in mosaic, in brickwork and stonework, was proper, and they felt that the work was enhanced. Another point mentioned was the advantage of decorative painting for walls over easel painting. They must all know the great difference there was in effect between a picture seen in a studio and as seen in a room. The blame was often put upon the architect, because it was said his rooms were not suitable to the picture, but if the difference in the lighting of the studio and the room were considered perhaps the studio would be in fault. Mr. East had given them a very delightful paper, but the speaker thought there was no need to plead for landscape-painting as a medium of decoration. A sober landscape in long panels could be made a pleasant feature in a room. Passing on to Mr. Solomon's paper, the speaker said the principal point was the suggestion for establishing schools for decorative painting. They all agreed that one great difficulty in decorative painting was that painters as a rule liked to do their own work, and it was a laudable spirit, but in great buildings progress would be so slow under such conditions that such an idea of perfection could not be carried out. It should, therefore, be the highest ideal of the painter to train a band or school to carry out his compositions. He did not quite understand Mr. Solomon when he said that there should be a new school. He hoped it was not suggested that there should be quite a new school, because there were already in existence very solid foundations of schools in which a training in decoration could be carried out. The school of the Royal Academy did good work in this respect, and the Academy endeavoured to encourage the students by giving from time to time a commission to paint on the walls some of the prize designs which had been won by the students. There was already a wish for the architectural student and the sculptor student to work side by side, and there was the Royal College of Art at South Kensington to foster the wish, and both merely

wanted recognition and encouragement by the public to do what Mr. Solomon proposed.

Professor BERESFORD PITE seconded the vote of thanks, and said the fact had been mentioned that the Royal College of Art was in existence. He hoped Mr. Solomon would pay an early visit. The students there not only worked together and were obliged to share in the work of each other's classes, but in two series during the course of the year they travelled abroad together. Every year groups of painters, architects and sculptors travelled and studied together, bringing back their work together, and the happy day had come when those artists were working hand in hand. It was unfortunate that the great painter and the great architect had not yet been fused into the architect who could decorate. Probably the fault rested in education, but before they could abrogate the education they must recognise the fact that architectural sense should be understood.

Mr. H. H. STATHAM supported the vote of thanks.

Mr. J. D. CRACE said that at the present time what they ought to begin to consider was that decorative painting ought really to be the painting which decorated in the sense of adorning, and the building must be from the beginning the one object to study. It did not matter in the least whether the decoration was a battle scene or a picture of saints, but in colour and form it should improve the building.

The PRESIDENT put the vote of thanks to the meeting, and it was carried by acclamation.

NELSON LIBRARY COMPETITION.

THE following is the assessor's report on the 207 sets of competitive designs submitted in competition:—

Parr's Bank Chambers, Manchester:
March 16, 1905.

Mr. Mayor and Gentlemen,—In accordance with your instructions, I have made a most careful and exhaustive examination of the whole of the drawings submitted for the above, and herewith beg to lay before you my adjudication thereon.

In the first place, I feel called upon to emphasise the extraordinary response of the profession to your invitation and apart from the number of designs sent in—which, in my experience, is unique—the general merit of the majority of the schemes is also very exceptional, many able and carefully thought out designs having been prepared. The difficulty of arriving at an equitable decision has been considerable. Every scheme submitted has received from me a most careful perusal and investigation, and as a result of my deliberations I have no hesitation in awarding the set of drawings numbered 50 the honourable position of first place. The author of this design has shown conspicuous ability in successfully dealing with the problem both from the points of arrangement, construction and design. In every way the scheme is most meritorious and admirably adapted to the several purposes of your proposed structure, as set forth in your conditions, instructions and particulars of competition.

As a practical, up-to-date working library for a manufacturing town like Nelson, it would, in my opinion, be hardly possible for the general arrangements to be much improved upon. It is evident the author has thoroughly mastered the salient points to be striven for in the successful planning of a town library, and the strength and refinement shown also, both in his interior as well as exterior designs, clearly indicate he is "master of his craft." The treatment of the elevations is essentially a suitable one for execution in stone, of a monumental character, and in harmony with the adjoining buildings, symmetrical façades being obtained to the principal streets. The maximum accommodation has been provided on the ground floor (as per instruction No. 12) on the limited space at command, and it was a happy thought of the author to locate the ladies' reading and news-room on the first floor over the central portion of the elevation facing Carr Road, placing also their conveniences over those on the floor below, well lighted and ventilated, and all well away from the principal façades. The excellent lighting of the building throughout should be specially noted, also the utilisation of the roofing to its utmost capacity. The price per foot cub on which the author has moneyed out the work ought, in my opinion, to be sufficient to carry out the scheme.

accordance with your conditions, provided due care is exercised in the detailing generally.

By entering the library from Booth Street additional privacy and quietness to the building is insured, at the same time the likelihood of loafers and other undesirable people misusing the same is lessened. This arrangement also has enabled the author to produce a better working plan than could possibly be obtained by having the entrance to Carr Road. The provision of a small lending store shown to the boys' reading-room in the basement is another indication of the author's familiarity with library planning, and if not immediately adopted it might be in the future as the work increases, and would tend to relieve the existing book store on the ground floor. The provision also for a female staff-room and conveniences on the first floor, at back next Ellen Street, is another thoughtful and desirable adjunct.

Respecting my decision as to the awarding of the second place, for which a premium of 25*l.* is provided, I have had considerable difficulty in advising you.

Although many commendable schemes, carefully conceived and most conscientiously developed and worked out by their authors respectively, have been submitted, yet in each project are to be found a number of points of defect. Two schemes, however—viz. No. 1 and No. 73—contain certain merit of their own, either in plans or elevations, coupled with a sincere and earnest effort to faithfully solve your problem, and I have found it necessary to bracket these two an equal second.

The third place I have given to the design No. 12, a carefully thought out scheme, with the entrance from Booth Street. The plan is a good one, and had the elevations been equal to same it might perhaps have taken a still higher position. The time, labour and money spent on this competition by the competing architects amount in value to about 4,000*l.*, and the extraordinary response by the profession to your invitation emboldens me as your assessor to respectfully suggest that under such exceptional circumstances you disburse the whole of the three premiums offered as some return for the enormous amount of money expended.

In conclusion, I can with the utmost confidence affirm that should your Council adopt Scheme No. 50 they will secure the best design submitted, and one that most fully and adequately embodies their requirements, taken as a whole, a decision also which I feel certain will meet with the profession's endorsement.

I desire to sincerely thank the chairman of the library committee, the librarian, the town clerk and deputy town clerk, all, for the valuable co-operation and assistance they have so loyally rendered me in fulfilling my difficult task. The very real interest they have shown in the work has been most helpful in arriving at an equitable decision.—I remain, Mr. Mayor and Gentlemen, your obedient Servant,
GEO. H. WILLOUGHBY, F.R.I.B.A.,

The successful competitors are:—(1) W. Brandreth and David, A.R.I.B.A., J. R. Poyser, joint architects, Nottingham; (2) David Bird, A.R.I.B.A., Manchester, and G. Fox, F.R.I.B.A., London; (3) H. T. Rees, Liverpool.

REINFORCED CONCRETE IN AMERICA.

A COUPLE of years ago it was the fashion to speak of that time as the concrete age, but the progress of one generation of concrete construction, that of reinforced concrete, makes it possible, says the *Engineering Record*, to speak of the present time as the reinforced concrete age without much risk of serious dispute. It is unlikely that any one who is not thoroughly in touch with the legitimate growth of concrete-steel construction appreciates the rapidity with which it is coming into vogue. This does not refer to those haphazard constructions of interest mainly as an indication of aberrations to which an untrained mind is prone, but to the reasonably well-considered buildings and bridges designed by reputable and competent engineers, and erected by contractors who have no desire to do anything but high-grade work.

The progress in bridge construction has received much more attention than that in any other class of concrete steel, because people accustomed to discuss their work in technical meetings have been interested in it. Consequently the limited information concerning bridges of this nature is voluminous; in fact, it may be considered so voluminous that it has overshadowed the interesting work done in reinforced concrete in buildings. This latter is particularly im-

portant just now because it seems probable that many industrial plants, as well as structures put up in cities for light manufacturing and as warehouses, will probably be constructed partly or wholly of reinforced concrete. This view in no way reflects on the manifest merits of terra-cotta systems but simply recognises the possibilities of the new material along certain lines which have nothing to do with engineering considerations.

The first of these merits of reinforced concrete is its ready execution. In these times, when the man who works on a building considers himself much more important than the capitalist who supplies the funds, it has become a question when it will be possible to complete a masonry and steel structure after it has been started. So many unions of skilled workmen now exist that when they are not engaged in fighting the master workmen they are scrapping among themselves, and during all this period of warfare the men are idle. Consequently when they are at work they expect to get very large wages in order to replenish their depleted larders, and the man whose money is standing idle all this time gets nothing but trouble in return for his investment. With concrete construction nothing of this sort can occur on such a scale, for with it skilled labour is not required—merely skilled supervision. No attempt to unionise unskilled labour has been successful up to the present time, and for this reason it seems improbable that the delays incident to ordinary building operations will occur with the erection of concrete-steel structures.

Another point to be considered is the fireproof character of reinforced concrete buildings. Such structures, with walls of brick, concrete blocks or thin concrete, and metal window sash, are practically fireproof, and offer two marked advantages. The first of these is the practicability of putting up high warehouses in cities like New York, where the building laws limit the height of structures of so-called mill construction to six storeys. This is an important consideration, particularly when it is considered that the difference in cost in many parts of the country between the two classes of construction is practically nil. The second consideration deserving mention is the probable decrease in insurance premiums which will follow the adoption of concrete in place of mill construction. While the saving on the building itself may not be particularly important, it is not unlikely that the saving of premiums on stock carried in the structures will be considerable.

Many structures of reinforced concrete have been built recently which are now in use carrying machinery of considerable weight, and while these buildings have not been in service very long, it seems likely, from the limited experience with them, that they will serve their purpose well. In designing a shop of this construction it is, of course, important to know when the plans are prepared just what will be the weight and location of the machinery they are to contain. With this information in hand there is no reason why a satisfactory system of construction cannot be devised provided the plans are worked out by a competent engineer who will consider all their details, and their execution is entrusted to good contractors with a reputation to maintain as specialists in such work.

GLASGOW ART SCHOOL.

THE diplomas granted last session by the Glasgow School of Art to public school teachers were presented on Saturday in presence of a very large gathering. Mr. James Fleming, chairman of the school governors, presided, and in the course of some remarks said the function was a new experience in connection with the art school, and it was, he believed, a very happy augury for education in Scotland. The diplomas were given to school teachers who, though they might have received their earlier training elsewhere, had passed the last year of their course at the School of Art. It was very graceful on the part of the School Board to work in association with the School of Art, yet it was the proper thing to do, and he felt that it was another step towards bringing together the various parts of the whole system of education in Scotland. The winners, who numbered twenty-eight, were afterwards presented with their diplomas at the hands of Mr. A. R. Andrew, H.M. Chief Inspector of Schools in the West of Scotland, who was cordially thanked on the motion of Mr. R. S. Allan, chairman of the Glasgow School Board.

ILLUSTRATIONS.

ST ANN'S CATHEDRAL, LEEDS.

MOUNT STUART, ISLE OF BUTE, N.B.—THE ENTRANCE HALL.

ST. AIDAN'S CHURCH, BASFORD, NOTTINGHAM.

THE building shown in the illustration was consecrated on February 21. It was erected from designs by Messrs. EVANS & SON. The money was bequeathed by the late GEORGE WATERELL. At present only the nave and aisles have been built.

BUTTENHAUGH, ELMSWELL, SUFFOLK.

THIS building is erected from the designs of Mr. H. STEWARD WATLING, F.S.A., architect, on the old village green at Elmswell, and formerly known as Buttenhaugh Green. The walls are constructed with local old bricks for the lower storey, the upper storey being half timberwork and plaster, and the roof covered with flat tiles. The contractors were the Oak Building Company, of Colchester and Cambridge.

CHURCH AT GOTHEN, IN THE ISLAND OF GOTHLAND, SWEDEN.

THIS church is an example, and by no means the most curious one, from amongst upwards of ninety country churches in the island. These churches, according to Mr. HAIG, may broadly be said to belong to three periods, namely, the Romanesque and Transitional of the twelfth and thirteenth and the Gothic of the fourteenth century, each in its simplest form. There is reason to believe that the first churches erected in the island were of wood, and the earliest chronicled date for their building is the beginning of the eleventh century. These early churches were probably burned by the worshippers of ODIN and THOR, a powerful section of whom had yet got a stronghold in the island. The heathen were, however, soon conquered, and new churches were built, this time of stone. Of these the church of Akeback is the oldest, its date being about the year 1140. STRELOW, a Danish author, and sometime superintendent in Gothland, his birthplace, collected a number of fables as regards the earlier times, and a number of documents and valuable facts as to later periods, and published them at Copenhagen in 1633, under the title of "Cronica Gutlandorum." This book has been until our days a favourite work of reference to all writers about Gothland, but as these have chiefly been literary men with some taste for archæology without the requisite technical knowledge of architecture and the sister arts, they have misplaced most of the dates. Some confusion has been caused by the circumstance that towards the end of the fourteenth century it became necessary to rebuild or enlarge many of the churches, which had become too small for the growing population. The writers referred to have not only entirely ignored the date of these later structures, but have actually assigned to each church the very earliest date mentioned, that is, the date of the probable wooden churches, or the eleventh century.

In *The Architect* for March 10 an article on "Indian Monuments" appeared which was acknowledged to be derived from the *Times*. From the intimate acquaintance with departmental detail which it revealed it was supposed to have an official character, and was intended to explain the reorganisation of the Archæological Survey of India by Lord CURZON. On that account the article was reprinted in its entirety. We have been informed by the Proprietors of the *Times* that the copying was in excess, and therefore interfered with their rights, which are incontrovertible. We regret that such a view had to be taken by them, and frankly apologise for our inadvertence in treating the article as a *communiqué* from the Indian Government.

NOTES AND COMMENTS.

ENGLISH Judges do not seem to be disposed to recognise the right of an architect to act as an agent in the sale of property. It was, no doubt, through an impression that in equity an architect could not make a claim for work of the kind that induced Mr. MURRAY SCOTT, to whom Englishmen owe much for his services in connection with the Wallace collection, decline to pay M. ISABEY, the French architect, his fees as agent in the sale of the beautiful property of Bagatelle to the City of Paris. It was purchased for 6,500,000 francs, and M. ISABEY claimed 300,000 francs, which was rather less than 5 per cent. on the sum given. The case was tried before the Civil Tribunal, and Mr. MURRAY SCOTT was ordered to pay 200,000 francs to M. ISABEY for his trouble in the negotiations and his expenses in making the advantages of the property known to the public. It is doubtful whether, under similar circumstances, an architect would have been successful in an English court.

THE exploration of the Roman fort at Barhill, Dumbartonshire, has demonstrated that the strangers were not altogether indifferent to art in that remote region. The fort was intended for the protection of the Antonine Wall, and was nearly square on plan, the length from east to west being about 100 yards. There was a gateway on each side. Within the area there was, underneath the general level, a trench defining the outline of a smaller fort of quadrangular form with rounded corners, about 180 feet in length by 150 feet in breadth. This smaller fort lies unconformably within the larger, the southern part of the pretorium being built almost diagonally across its southern ditch. The well in the pretorium, which is 43 feet deep, was cleared out to the bottom, and found to be almost filled with architectural fragments, including parts of shafts and twenty-five capitals of pillars, an altar with an inscription by the first cohort of the Bætians, an incomplete tablet inscribed to the Emperor ANTONINUS PIUS, a pulley-wheel and frame and the remains of a wooden bucket with iron hoops, a bag of tools and fragments of pottery. From a number of refuse-pits and from the ditches a miscellaneous collection was obtained, including the usual broken pottery and glass, a small bronze pot with a swing handle, a quantity of iron objects, among which were spear-heads, harness mountings, buckles and staples, wooden articles including some parts of a wheel, a quantity of shoes, sandals and soles of all sizes, and three curious portrait busts of stone. The excavations were carried out at the instance of Mr. A. WHITELAW, the owner of the ground, by Mr. ALEXANDER PARK.

A SELECT Society existed in Berlin known as the "Werkring," and which had for its object the promotion of art in the house as well as in the furniture. The committee have decided to make it better known, and recently Herr AUGUST ANDELL, the architect, explained the objects of the Society at a meeting which was held in the Architects' Club. It is desired to advance the union between artists and amateurs. The organisers believe that too much attention has been given to stereotyped forms, and they wish to promote originality. For that purpose it is necessary not only that artists should endeavour to emancipate themselves from the past, but that the public should also be able to appreciate their efforts. It is easy enough to get patrons for meetings, but the difficulty is to find people who will be sufficiently enthusiastic for novelty as to pay for it. The experiment of the Berlin Union will therefore be watched with interest by architects and craftsmen in many parts of the world, especially as success can only be gained by a contest with officialdom which in Germany will not allow art to be free.

MOHAMMEDAN ART.

PAPER was read at the meeting of the Society of Arts on the 15th inst. by Mr. E. H. Hankin, M.A., who has been as bacteriologist and chemical analyst to the Government of the Central Provinces of India, "On some Discoveries of the Methods of Design employed in Mohammedan Art," which was illustrated by diagrams. A report of the illustrations appears in the *Journal* of the Society.

Mr. Hankin said:—The most striking peculiarity of Mohammedan or Saracenic art is the employment of extremely complicated geometrical patterns. The actual methods by which these patterns were drawn and designed so far as he was aware, unknown to modern artists in Europe, in India, or in Egypt. The works of Le d'Avesnes, of Bourgoine, or of Gayet dealing with Arabian art are equally destitute of any satisfactory explanation of the matter. Some years ago he commenced to study the subject in India. At length, by a lucky chance, he discovered a clue in a small room in one of the palaces of Akbar, the great Mogul emperor. Here, nearly hidden in dust and dirt, he found the actual construction lines used by the artist some four and a half centuries ago in producing an arabesque pattern. By means of the clue thus obtained he came easily to draw the more complicated of the patterns. The clues to the simpler classes of patterns were obtained in the most part by observation and measurement. The methods are not simply methods of draughtsmanship. They may be described as methods of design, as by their means it is possible and easy not only to copy old patterns, but to design new ones in conformity with the rules of geometrical art.

Geometrical patterns may be divided into the following classes—(1) square, (2) hexagonal, (3) octagonal and (4) arabesques. In the first class the space to be decorated is divided into squares. Parts of these squares go to form a pattern. This class will be found described in any elementary text-book of design, and includes various patterns, the fylfots, the Greek fret, rectangular lattices, &c. The method of drawing the second class of patterns, the hexagonal, is also widely known and calls for no special description. Lines are drawn crossing each other, not at right angles as in the square patterns, but at angles of 60 degrees, thus dividing the space to be decorated into several triangles.

The third class of patterns consists of, or is derived from, octagons. There are grounds for believing that in the design of octagonal patterns an octagon was cut out of talc or paper, or some other suitable material, and used as a template. Whether or not a draughtsman should use templates in the actual employment of these patterns may be considered as a matter of individual taste and habit. But templates are useful in the designing of these patterns and may be admitted on consideration of the facts contained in the following paragraphs. Indeed, it is difficult to see how more complicated of the octagonal patterns could have been designed without the use of templates. The common octagonal patterns usually contain octagons of two sizes which may always be regarded as derived one from the other by the following very simple construction. An octagon is drawn in which opposite angles are joined in pairs by lines. The result of drawing these lines is to produce an eight-pointed star in the centre of the octagon. The outer octagon is formed of such a size that one of its sides fits into the angle of the eight-pointed star. Thus we have a large octagon, a small octagon, and an eight-pointed star. These three figures combined in different ways go to form the majority of octagonal patterns. For the designing of the patterns it will be found convenient to cut out three outlines as templates.

The most complicated class of patterns are those to which the term "arabesque" may be appropriately reserved. These patterns are practically peculiar to Mohammedan art and both in their complexity and in their æsthetic value stand on a higher plane than the patterns hitherto considered.

The most square, hexagonal and octagonal patterns the lines run in two, three or four directions respectively. In arabesque patterns the lines run in a much larger number of directions, suggesting that some unusual method was employed in their construction. Mr. Hankin having described several arabesque forms on a geometrical basis he supposed it is required to discover the construction of any given arabesque, proceed as follows. Mark the centres of all the larger spaces included in the pattern, and, joining, as a rule, the star-shaped spaces. Join these points. The polygons thus produced are the primary con-

struction lines. Supposing it is required to copy an arabesque that exists on a ceiling or in some other inaccessible position, a similar method will suffice. On looking at the pattern it is easy to imagine lines joining the centres of the larger spaces, which lines describe polygons. A rough sketch may be made of these imagined polygons. From this at leisure an accurate drawing may be made. In doing so it is necessary to make the different polygons as symmetrical as possible, and, so far as possible, having their sides all of equal length. Guided by this rule, and after a little practice, any complicated arabesque pattern can usually be solved in ten minutes. On the other hand, Mr. Hankin failed to solve some of the apparently more simple patterns despite a more extended study.

One of the objects of decoration is to prevent the eye being displeased by monotony. A geometrical pattern, however elaborate, if used too much, will produce that effect of monotony that it was intended to prevent. It will then become as tedious to the eye as a Greek fret was to Ruskin, or as a cheap floral wall-paper may be to anyone else. In some of the best buildings in Futteypur-Sikri the artist has nearly worked up to the standard of discarding each pattern as soon as he had used it once. In Birbul's house, for instance, a number of richly decorated pilasters are present in the different rooms. Each pilaster has, on its face fronting the room, three carved panels. On each pilaster the upper and lower of the three panels bear the same pattern, but the middle panel always carries a different pattern, and the patterns used on one pilaster do not occur on any other. These patterns are nearly all geometrical, but a few are floral, thus further preventing any impression of monotony.

That the pattern should be adapted to the space it has to occupy is a truism observed in almost every system of art. In the case of geometrical patterns this truism admits of a simple geometrical expression which, with rare exceptions, is adhered to by Mohammedan artists and ignored by European artists when copying Mohammedan designs. In all the patterns used to illustrate the paper star-shaped spaces occur at regular intervals. The rule very generally observed in Mohammedan art in India is that each corner of the panel is occupied by a quarter of one of these star-shaped spaces. If several repeats of the pattern occur in the panel, half stars will occur along the sides, besides quarter stars in the corners. The panel always contains a whole number of repeats. If the pattern contains eight-pointed stars, the space included in the stars may be filled up by fylfots (or outlines of that nature), and then adherence to the rule is only to be discerned on studying the construction of the pattern. In some of the perforated stone balustrades that form so pleasing a feature of the buildings in the garden of the Taj at Agra, the pattern has been visibly and greatly distorted to insure compliance with this rule in the space available. The tomb of Itimiyad Ud Daula in Agra offers a striking illustration of the observance of this convention. Worked into its marble mosaic are hexagonal, octagonal, decagonal and dodecagonal patterns in the greatest profusion, but in every panel, whatever its size and shape, quarter stars are always to be found in each of its four corners. The difficulty of designing the building must have been greatly added to by the observance of this rule. One is tempted to suspect that the building was designed to fit the patterns.

In Mohammedan art, as it occurs in Egypt and Spain, this method of adaptation to the space is sometimes followed. At other times a different plan is adopted. The Moorish artist sometimes put more than a quarter of a star in the corner, and more than half stars along the sides. The arrangement is such that the rays of the stars along the sides form a sort of inner border which is accentuated by the colouring adopted in the original design.

Owing to observance of this rule a panel of given shape is not suitable for the reception of any and every pattern. If the panel is a square, or if it is made up of a whole number of squares, it may be decorated by an octagonal pattern, or by those octagonal and dodecagonal arabesques whose repeat is a square. The repeat of a hexagonal pattern is usually a rectangle whose diagonal forms an angle of 60 degs. with the base. Such patterns are therefore not applicable to square panels, but only to panels that are rectangles of this proportion, or to panels that may be regarded as made up of such rectangles. The repeat of arabesques whose primary construction lines include decagons is usually a rectangle, whose diagonal forms an angle of 36 degs. In "Les Éléments de l'Art Arabe," by Bourgoine, may be found a large collection of

arabesque patterns. In some of these patterns that contain fourteen-rayed stars the unit of pattern is a rectangle whose diagonal forms an angle of about 38 degs. With sufficient knowledge a pattern may be found to suit a rectangle of almost any shape.

A few words may be added as to the amount of accuracy needed and advisable in drawing geometrical patterns. In elementary text-books of design it is commonly asserted that pattern outlines look better when drawn in by hand than when drawn in by compass and rule. The truth of this statement may be admitted without reserve so far as the simplest pattern shapes and outlines are concerned. With regard to less simple patterns, however, some reservation is necessary. If a hexagonal pattern is made with the aid of construction lines that have not been drawn at exactly the correct angle, every hexagon in the pattern will be distorted. If lopsidedness occurred in a single hexagon it perhaps would not matter. But when every hexagon is lopsided to the same extent, and in the same direction, the effect is cumulative and unpleasant. The suggestion that the artist was trying to draw hexagons and failed because he didn't know how to do so, is a suggestion that obviously should be avoided. If, however, the construction lines of a hexagonal pattern are drawn in with accuracy, the pattern may well be drawn in by hand.

Arabesques are usually found drawn accurately. In the case of the more complicated arabesques, this would seem to be necessary to produce their full æsthetic effect. But a relatively simple arabesque may be distorted in order to make it fit the space; that is to say, to get exactly quarter stars in each of the corners of the panel. In order to do this it is necessary to draw first the construction lines, modified or adapted to the space, and then on these lines to draw the pattern.

By observing which patterns were placed in prominent positions, and which were placed where they could not attract much notice, it is possible to arrive at some ideas as to what features of a pattern were considered good by Mohammedan artists. A pattern containing several lines crossing at one point like the spokes of a wheel, as already mentioned, is not much used. The best patterns are those in which all the constituent spaces have either a radial or a bilateral symmetry, that is to say, are free from lopsidedness. A pattern is bad if it contains spaces of the same shape but differing slightly in size. If a construction leads to such a result the pattern must be modified so that the spaces become either identical in size or else widely different. Cases have been mentioned in this paper in which gracefulness in a pattern is obtained by drawing it in conformity with some geometrical rule. Cases also may be found, though rarely, in which the geometrical method leads to a clumsy result, that can be remedied by freehand drawing.

SIR GEORGE BIRDWOOD said it would appear that the Greeks habitually applied geometry to the perfection of decorative design. Decoration must ultimately have a geometrical basis, and must be controlled by geometrical law, however unconscious the decorator may be of its operation. More than that, where decoration is attempted in conscious violation of geometry it rapidly lapses into indecorum and fatuity; furthermore, there is good decoration that to the inartistic eye appears to be geometrical outlining pure and simple, but which really is entirely of artistic inception and draughtsmanship. And no doubt the Oriental craftsmen of Saracenic art, including the Indian, kept up the tradition of the Greek use of geometry in the skeleton lines of their schemes of ornamentation; and we have indeed an obvious proof of this in Mr. Hankin's discovery. All this may be granted, and it cannot be gainsaid. Nevertheless, he (Sir George Birdwood) was convinced that the inspirations of artistic decoration came directly all from animated nature, and that the most inspired of the inventors of the decorative types derived from this ever-springing fountain of artistic impulses and imagery never had a thought of geometrical proportion in their minds. Much of what passes for geometrical ornamentation is due to the form imposed on it by the material used for its production, such, for an instance, as matting, wherein the graceful undulations of a snake work out in a crude "key pattern." The gradual conventionalisation of a design leads also to its gradually taking on more and more of a geometrical aspect; and, again, the decay of artistic inspiration or of technical dexterity will conduce to the deterioration of an ornament to the baldest of geometrical formulas.

Mr. LEWIS DAY said the author had spoken as a mathe-

matician and not as a designer. He (Mr. Day) could imagine a designer always going to work in the manner described. There were so many ways in which the elaborate patterns which had been shown could be constructed. He had always felt very strongly that the simpler patterns found in the Opus Alexandrinum were built up of little triangles, &c.; that was more likely the way in which the more elaborate work was done, and not by means of templates. The patterns which the author had stated to be built up by putting together dodecagons could equally well have arrived at by striking circles, and at the intersections of those circles drawing straight lines from intersection to intersection. It had to be remembered that when the designer drew those elaborate patterns he did not have the whole area of lines, &c., in front of him; he designed a little piece which he could keep in his mental grasp. He had only to keep that small unit in his mind; he knew what the effect of repeating the unit would be.

Professor O. MULLER said there was a tendency to judge a pattern to be good or bad according as it approached more nearly to a proper geometrical basis. That was apparent in many of the pierced screens in the buildings at Agra.

Mr. HANKIN, in reply, said that at Futteypur-Sikri the geometrical methods seemed to have the day, whereas in the buildings in Agra and in all work produced at the present day geometrical methods had fallen into the background. The modern workmen in India were incapable of drawing designs which Mr. Day said could be drawn instinctively by using geometrical methods. They had completely forgotten these methods. In the old work of four centuries ago there were extremely complicated arabesque designs and no suggestion of a method had been brought forward by which they could have been drawn except by the methods he stated in his paper. In Futteypur-Sikri, not only were geometrical patterns of that nature, but even the curvilinear designs were drawn to a great extent by means of a pair of compasses and similar geometrical methods. In the work in India, such as was found in the Taj and the Palaces at Agra, graceful floral outlines were found, but to the best of his knowledge they were not drawn by means of a pair of compasses, but by the free hand guided by the artistic sense of the artist. The buildings at Futteypur-Sikri were in a way archaic. The idea had often suggested to him that perhaps the artists who had to do with the buildings at Futteypur-Sikri were, when judged by European standards, people of low artistic powers; it was all probable that they were incapable of drawing a graceful curve without some such mechanical method as a pair of compasses; but in the later work and in the higher products of Indian art no traces were found of such a hindrance. The fact that these geometrical methods were so completely forgotten in India was no hindrance to the production of artistic products. In their place it would be found that in Agra and its neighbourhood the stone-masons produced floral outlines of the greatest gracefulness and the greatest suitability to the purpose they had in view. The fact that they had forgotten the old trammels of geometrical pattern was not a hindrance but a help to their work. If one went through the slums of Agra, or any other town in that part of India, the façades of houses would often be seen decorated with the most exquisite stone-carving, which in his opinion equalled, if not surpassed, the more famous work of earlier days.

A GIFT TO GLASGOW.

GLASGOW'S good fortune in the matter of gifts to the public gallery is, says the *Glasgow Herald*, the subject of much comment in London at the present time. Only a few months ago, under the will of Mr. James Hamilton, the Corporation became prospectively entitled to 50,000*l.* for the purchase of pictures, and now, by the bequest of Mr. James Donald, a fine collection of works by French masters of the school of 1830 and others is to go to the Corporation. Not unnaturally comparisons are being made between the Donald assemblage and the hundred or more works bequeathed about a couple of years ago to the Corporation of London by Mr. Charles Gassiot, citizen and vintner. Mr. Gassiot, despite the fact that he paid very "long" prices for a number of his pictures, did not succeed in bringing together a gallery which would wholly satisfy the genuine connoisseur. Popular Academy pictures proved too great an attraction. There are, of course, some excellent things, but probably Mr. Gassiot

himself the taste of Mr. Donald, nor was the professional
ice he sought so well balanced and far seeing as that
ined in Glasgow by the Scottish collector. For instance,
ng the sixteen Gassiot pictures which, based on auction
es, show a total of about 24,000 guineas, there may be
ed T. Webster's "The Smile" and "The Frown," each
nches by 24 inches, 1,600 guineas; Goodall's "Head of
House at Prayer," 1,150 guineas; William Collins's
nday Morning," 1,380 guineas; Patrick Nasmyth's
eting of the Avon and the Severn," 1,500 guineas.
are for picture, taking them on the average, Mr. Donald
st certainly spent considerably less than Mr. Gassiot.
it will be seen that for under 20,000*l.* he succeeded in
iring a number of really fine works to-day worth nearly
le what they cost, works which would be eagerly
pted by any public gallery in this country.

From a trustworthy source have been received details
of the cost price and the approximate present value of
ity pictures and one pastel in the Donald collection.
der to facilitate reference, the details may be set out
in tabular form. The numbers within brackets after the
s correspond with those in the catalogue of the Glasgow
International Exhibition, 1901, where the works in question
were seen. For some time Mr. Donald had lived chiefly at
Glasgow, but he had no pictures or other objects of great
value there or anywhere but in Glasgow. He bought almost
all his pictures in Glasgow, many of his principal pictures coming
from Messrs. Craibe Angus, the same firm to whose
good taste and discretion the fine assemblage of the late Mr.
Hamilton Bruce owed so many of its treasures. The
following list is self-explanatory:—

Artist.	Work.	Cost.	Present Value.
Donald	Returning Home: cattle and sheep, 36 by 29 (1303)	£3,000	£6,000
Donald	Cattle (1294)	450	700
Donald	Sheep (1302)	350	700
Donald	Going to Work, 22 by 18 (1300)	1,200	5,000
Donald	The Sheepfold: moonlight (pastel), (1238)	800	2,500
Donald	The Cray Fisher (1298)	3,000	5,000
Donald	The Woodcutters	1,200	3,500
Donald	Evening (1307)	300	1,000
Donald	Clair Bois: Fontainebleau, 27 by 41 (1291)	2,000	4,000
Donald	The Heath (1305)	500	800
Donald	Adoration of the Magi (1310)	300	1,500
Donald	St. Jerome in the Wilderness (1308)	600	1,000
Donald	Point des Dunes: L'Orage (1309)	600	1,000
Donald	River and Ducks (1297)	350	1,200
Donald	The Happy Family (1292)	300	1,000
Donald	In the Forest (1301)	150	450
Donald	Roses (1306)	120	350
Donald	Sheep and Shepherd (1241)	40	400
Donald	Girl on Sofa (1296)	40	400
Donald	Dutch Boats (1205)	50	300
Donald	View of a Town (1236)	60	400
		£15,410	£37,200
Donald	Lyme Regis (W.C.) (797)	450	
Donald	Two Views of Venice (49 and 51)	100	
Donald	The Artist in Spain	450	
Donald	Taming of the Shrew (449)	700	
Donald	The Young Housewife, 1880 (601)	300	
Donald	Philip IV. (from Secretan Collection)	600	
Donald	Landscape with Figures	400	
Donald	Small picture	450	
Donald	Lee Plat de Delft (fine, bought 18 years ago)	400	
Donald	Still life (fine, bought 20 years ago)	300	
	Cost of 32 works	£19,560	

Needless to say, the above table is not exhaustive. For
example, there are two more examples by James Maris,
from the Hamilton Bruce sale; a water-colour study of
a canal, 11½ inches by 6½ inches, sold to Mr. Bruce
Messrs. Craibe Angus for 35*l.*, and bought on behalf of
Donald at the Bruce sale in 1903 for 210 guineas; and
a scene, 18½ inches by 24 inches, similarly acquired by
Donald for 150*l.* and bought by Mr. Donald at 850 guineas.
No note has been taken of the etchings by Meryon,
Gandt, Dürer. In the Queen's Terrace House there is,
a splendid "Hawthorn" pot, and a pair of Oriental
vases with ormolu mounts, which at the Hamilton Palace

sale fetched 450*l.* guineas. By the way, Mr. Donald lent
three of his French pictures to the Guildhall exhibition in
London seven years ago. These were Nos. 1, 4 and 9 in
the foregoing table. In Scotland appreciation for Corot and
Rousseau, for Millet and Troyon, for the Maris brothers,
James and Matthew, came earlier than in England. Hence
there is something of poetic justice in this splendid Donald
bequest to the Glasgow Corporation.

ARCHITECTURE OF IONA.

A MEETING of the Glasgow Archæological Society was
held on the 16th inst.—the Rev. Professor Cooper,
D.D., in the chair—when a paper by Dr. John Honeyman,
R.S.A., was read, entitled "Certain Peculiarities in the
Architecture of Iona."

Dr. Honeyman said that so much had been written,
descriptive and historical, about Iona since the days of
Pennant and Pocock down to the days of Champneys and
Principal Story—late president of the Society—that on the
present occasion he would strictly confine himself to some
reference to peculiarities of arrangement or treatment
which the existing remains exhibited, and he found that
within reasonable limits he could only mention some of
these. There was nothing peculiar about the plan as it
existed now. The cloister was on the north side, but the
contour of the ground accounted for that as in many other
cases. There existed, however, fragments of an older
church at the north-west corner of the nave. There was a
semicircular-headed door which had been built up after all
the freestone parts had been removed, and there was also
a very peculiar structure connected with the old wall,
namely, the lower portion of a tower, the entrance to which
was by a small door, the sill of which was nearly 8 feet
above the ground. In this it resembles the round towers
and a few square ones built in the eleventh century and
earlier. But it has this very unusual peculiarity, that it is
built solid up to the level of the small entrance door.

In the north wall of the choir there is a very unusual
feature, two arches springing from abutments at each
side and resting on a circular column 2 feet 6 inches in
diameter, the base of the column and the sill of the arcade
being 6 feet 3 inches above the level of the choir floor.
Outside there is what now appears to be a side aisle, to
which access is obtained by a very beautiful door of much
later date than the arcade. Although since the insertion of
this door the floor has been at nearly the same level as that
of the choir, and the place was used as a sacristy, there is
evidence that originally the floor was much lower, as during
recent operations the remains of a floor 4 feet 6 inches
lower were found, and a piscina in the main wall of the
building near the level of the present floor shows that there
was here a chapel at a lower level.

After explaining in detail and with the aid of illustra-
tions what had led him to the conclusion, Dr. Honeyman
said that he had come to the belief that at one period
there had been a crypt at the east end of the cathedral,
probably something in plan, though not otherwise, like that
at Hexham, and that at that period the floor of the choir
was 6 feet 3 inches higher than at present, and that a side
aisle existed on the north side. The window in the east
wall of this aisle has a triangular head.

After referring to the very beautiful and peculiar window
in the east gable of the south aisle (just restored through
the generosity of Miss Campbell, of Blythswood), the
peculiar flying buttresses in that aisle, the archaic character
of the arcading in the north transept, the evidence that the
church had a flat ceiling resting on corbels still existing
about 4 feet below the wall-heads with apartments over it,
as at Torphichen, Lincluden and elsewhere, reference was
made to peculiarities in the chapter-house and cloisters.
He thought it probable that the north side next the oldest
part of wall was much the same as the corresponding
cloister at Oransay, but the other three sides were, as re-
maining fragments proved, on the beautiful model of some
of the older Italian cloisters, the wall being carried on a
continuous succession of smaller arches on coupled shafts,
as, for example, at Amalfi, where the same arrangement,
namely, a group of four detached shafts with bases and
capitals respectively wrought on one stone, is to be found.
At Iona the inner shafts were circular and the outer ones
octagonal, but these latter had this remarkable peculiarity,
that they were thicker in the middle by 1 inch than at either
end and had the beads at either end wrought on the shaft.

Attention was next drawn to peculiarities in the belfry. The most remarkable of these is the treatment of the windows, which are filled with flowing tracery, while the inner face of the wall is carried on two flat rear arches, the springer between the two resting on a column of peculiar design. It has been surmised by some that these formed part of an older structure, probably of Norman date, but the lecturer did not favour that idea. He had no doubt they had been specially designed for the place they had to occupy, and their old-fashioned character was quite in keeping with much that had been done there even after the fourteenth century, to the perplexity of Pugin and Parker. Above the belfry there was a chamber designed to be a dovecot. There are small openings for light and air and larger ones for the pigeons, and a liberal supply of pigeon-holes built in the inner face of the wall in the usual way. It is possible that the position of the floor of this chamber suggested the squatness of the belfry windows, just as the position of the upper chamber in the church explains why the arches at the crossing and the windows in the gables are all kept so unusually low.

Dr. Honeyman remarked that the pigeon-holes in the walls of the tower had suggested a new idea, namely, that in our larger towers the comparatively useless space between the first floor and the belfry floor might be divided into columbaria, honeycombed with "cells" for the reception of urns containing the ashes from the crematoria when churchyards were abolished. He thought it would pay when people became a little more enlightened.

In conclusion, he referred to certain earthworks a little to the north of the cathedral enclosure, and expressed the opinion that they had nothing to do with the works of Columba and his successors, but that they marked a very strong position occupied by the natives, and probably so occupied long before Columba's time. In the absorbing interest which the work of the great missionary saint inspires, we may be excused if we are prone to forget that the island of Iona had a history before his advent.

The paper was illustrated by drawings and photographs, and several plaster casts of monuments, lent by Mr. Alexr. Ritchie, 27 Scott Street, Glasgow, were exhibited.

MELANDRA CASTLE, LANCASHIRE.

THE following appeal for subscriptions in aid of the excavations at Melandra Castle has been issued by the Manchester and District Branch of the Classical Association:—

"We venture to ask your support for a project which, we think, will commend itself to many who are interested in the early history of Manchester and the surrounding district, or, more generally, in the influence of ancient civilisation upon our own.

"It is probably known to you that a considerable number of places have been identified in this district as having once been the sites of Roman camps or settlements. In most of these some attempts at excavation have been made at different times and by different individuals or societies, but there has been no organised body willing or able to undertake a systematic exploration of them, or the preservation of the antiquities they contain.

"This duty the excavation committee of the local branch of the Classical Association hope to carry out if sufficient financial support can be secured.

"In order adequately to excavate the site known as Melandra Castle—a piece of work which lies ready to hand—and to make a satisfactory beginning with other sites (in conjunction with the local committee in each case) it is estimated that an income of 100*l.* a year for five years is needed. A list of the contributions already received or promised is given in the circular, and further subscriptions (of 2*s.* 6*d.* or larger sums) to the excavation fund will be gladly received by the hon. treasurer, Mr. Harold Williamson, M.A., the Grammar School, Manchester.

"The excavation fund is kept distinct from the ordinary funds of the branch.

"Besides exploring new sites, the committee hope to co-operate with the 'Old Manchester' committee, of which the Lord Mayor is the chairman, in securing the collection and better preservation of any Roman remains discovered within the city itself.

"The committee hope that, as one result of their efforts, this excellent example of a Roman military station may be restored as far as is possible to the condition in which it was left, and preserved as a permanent contribution to

classical learning and a valuable object-lesson for generations of children and students.

"The committee wish it to be understood that they do not seek to become proprietors of any relics that they may discover. Their desire is to secure the proper custody and exhibition of all such objects in some public place as near as possible to the site upon which they have been found.

"Subscribers of 2*s.* 6*d.* or larger sums to the Excavation Fund, as well as members of the Association, will receive special tickets, which will secure them free admission to the site of any excavations undertaken or assisted by the committee.

"N.B.—The Melandra camp may be reached most easily by taking train to Glossop and then taking the Hadfield tram to the foot of the Camp Hill. The site is within twenty minutes' walk of Dinting station. The committee have arranged that one of their number shall be in attendance every Saturday afternoon up to the end of May. Keys may be obtained of Mr. R. Hamnett, High Street, Glossop.

"The subscription list shows an income of about 60*l.* for the present year, most of the amounts being promised for five years. The University of Manchester has authorised the Professors of Latin and Ancient History to devote a sum not exceeding 25*l.* from the departmental funds for the current year jointly, to aid the work of excavation."

The *Manchester Guardian* says that though the excavation committee of the local branch of the Classical Association have only been at work at Melandra for a few weeks, they have already succeeded in making an important contribution to a proper understanding of the way in which this military station was constructed. After some preliminary operations the committee decided to concentrate their attention for a time upon the north gateway. In searching for the gateway some 20 feet of the foundation of the rampart were first laid bare, and it has been necessary to remove accumulations to a depth of over 4 feet to disclose its plan. At present all that is seen of the stone rampart may be seen to the west of the entrance, beginning (at what must be the gate) with a stone marked upon the plan, which is 2 feet 9 inches square. This stone is broader than the rest of the corner and is itself protected by a rounded stone marked "Gate." Proceeding through the gate towards the camp from the boulder-like stone, we come upon what are apparently the western bases of two arches. The corresponding foundations on the other side are yet to be found.

In opening up the gateway an interesting section of road has been laid bare, showing that it was raised to the level of the footing of the walls and buildings. This footing seems to have been embedded in two kinds of cement, almost black and evidently containing iron, the other a light grey colour. Mr. Francis Jones, of the Manchester Grammar School, has kindly made an examination of the road and the first is found to contain ferric oxide, traces of iron and metals and sand; the latter consists mainly of silicate of alumina, with a trace of magnesium, which would suggest that it is merely a clay.

Concurrently with the excavation of the gateway a systematic examination of the Roman stratum within the camp area has been commenced. For this purpose the area has been divided into nearly four hundred square sections with 20 feet sides. The clay floors of the huts within the camp are still distinctly seen, the layer being several inches thick. The practice of sinking trial pits at odd points of the area has been discontinued on the recommendation of the committee, and in future complete floors will be carefully uncovered. Mr. Jones has also analysed the red substance of which these floors are composed, and which has the appearance of burnt clay. He finds that it contains siliceous iron and traces of other metals. Beneath one of these floors have recently been discovered the bases of a number of stakes, which evidently outline the building. The stakes were not pointed, but cut quite square at the bottom. They were evidently square oak poles, and when first taken out the wood showed the annual rings distinctly, but rapidly turned black. The bottom of the stake was 2 feet 7 inches below the base of the clay floor. In excavating this floor usual finds of glass, pottery, whetstones, &c., were met with. It was in the prosecution of work of this kind that the copper spearheads, lamp-stand and other relics were met with as well as the interesting set of about twenty marked Roman weights. These weights, as well as other objects made of lead, are thickly covered with a white coating, which Mr. Jones finds is composed of a double carbonate of lead hydrate of lead.

BIRMINGHAM SCHOOL OF ART.

It was lately announced that Alderman the Right Hon. William Kenrick, chairman of the Museum and School Art committee, presented to the Corporation of Birmingham the sum of 3,500*l.* for the endowment of scholarships in the Municipal School of Art. The matter was brought before the committee on Monday at the Council House in report presented by the management sub-committee. The money will provide ten scholarships of 10*l.* per annum each. On the motion of Mr. Edwin Smith (chairman of the management sub-committee), seconded by Councillor Murray and supported by the Lord Mayor, the following resolution was passed:—"That the hearty thanks of the Museum and School of Art committee be presented to Alderman the Right Hon. William Kenrick, chairman of the committee, for his generous gift to the Corporation of Birmingham of the sum of 3,500*l.* for the endowment of scholarships at the Municipal School of Art. The committee gratefully welcome in addition to the liberal gifts in furtherance of the work of education in the city which have from time to time marked the devotion to that work. The scholarships which he has provided since 1901 with the view of improving local craftsmanship have already enabled many apt boys to remain in the day classes at the central school longer than would otherwise have been possible; and the work of these William Kenrick's scholars leads the committee to regard with the utmost satisfaction not only the munificent endowment of the scholarships, but the opportunity thus afforded them of permanently associating with this valuable and important work the name of their chairman, to whose foresight and liberality the committee owe the inception of the scheme." A copy of this resolution is to be suitably lettered and bound in the school of art for presentation to Alderman Kenrick.

The management sub-committee reported the gift by Mr. Howard Wilkinson, Hamstead Lodge, Handsworth, of twenty-one birds and six glass cases for use at the Central School of Art. A vote of thanks was accorded Mr. Wilkinson for his acceptable present. The committee further decided to appoint Mr. Thomas Wright to a teachership of work at the central school on two evenings a week.

TESSERÆ.

Roman Aqueducts.

ROME was supplied with water from sources varying from thirty to sixty miles in distance, and at one period its history not fewer than twenty aqueducts brought as many different streams across the wide plain or campagna which the city stands. In the time of Frontinus (A.D. 100) the entire length of aqueducts exceeded 255 miles, the daily charge of which was about 300,000,000 gallons. Nor was it ancient Rome which alone reaped the benefits of these superb structures; the modern city is still abundantly supplied by three of them, which have undergone repairs and restorations, the most important of which was made by Sixtus V., from whose conventual name of Brother Felix the term Aqua Felice is derived. The chief provincial aqueducts of the Romans, as well as their own metropolis, were supplied with water by aqueducts; hence in Greece, Gaul, Spain, Italy, &c., portions of these extensive constructions remain to the present day. That of Nismes, built by Augustus, son-in-law of Augustus, is perhaps the most ancient of their provincial aqueducts. It was about thirty miles in length when entire, and traversed a very mountainous country, piercing through hills and crossing valleys by means of arches upon arches. It was constructed of squared stones throughout, and was coated in the interior, which is 4 feet by 5½, with finely prepared mortar. The "Pont Gard" is that part of the aqueduct of Nismes which crosses the deep valley in which flows the Gardon, or Gard. This part, considered alone, is one of the noblest monuments built by the Romans among the Gauls. It is composed of three ranges of arches one above another. The first range under which the Gardon runs is formed by six arches, the second by eleven, and the third by thirty-five, of which are semicircular and form a total height of 100 feet above the water of the river. The entire length of the bridge is 300 yards. This magnificent structure was destroyed by the barbarians about the beginning of the sixteenth century, but is still in such a state of preservation that it could be restored without a very great expenditure of

money. Passing over the ancient aqueducts of Lyons, in which the inverted syphon as well as the inclined channel-way was used, and of Bourgas, near Constantinople, the only other provincial structure of the kind to which we shall allude is that of Metz, of which a number of the arcades still remain. "These arcades," says an ancient authority, "crossed the Moselle, a river which is broad and vast at that place. The copious sources of Gorze furnished water for the representation of a sea-fight. This water was collected in a reservoir; from thence it was conducted by subterranean canals formed of hewn stone, and so spacious that a man could walk erect in them. It traversed the Moselle upon its superb and lofty arcades (3,600 feet long and 100 feet high), which may still be seen at the distance of two leagues from Metz, so nicely wrought and so finely cemented that, except those parts in the middle which have been carried away by the ice, they have resisted, and will still resist, the severest shocks of the most violent seasons. From these arcades other aqueducts conveyed the water to the baths and to the place where the naval engagement was mimicked."

The Parthenon as Hecatompodon.

The architects engaged on the works erected under Pericles at Athens having settled the general mass and scope of their buildings, found apparently already recognised the scheme which at any rate they used—a conclusion which cannot be resisted when one refers to the almost absolute identity of the measured features of the building with those which result from calculation. The Parthenon was planned upon the following considerations:—Above all things it was to be the hecatompodon, or the 100 feet; there was reason to believe that the cella of the Temple of Minerva, destroyed by the Persians, was 100 feet long, and that temple also bore the name of hecatompodon, although its breadth could not have warranted the epithet; but the new temple was made 100 feet broad on its upper step. To prove that it was so reference can be made to the comparative length of the standard measure of Greece compared with those of Rome and Egypt, and this comparison makes it certain that the breadth of the Parthenon on the upper step is accurately 100 Greek feet. A very interesting problem must have presented itself in the determination of the thickness of the stylobate on which the temple rests. There is a story that about seventy years later than the building of the Parthenon the inhabitants of Delos, being afflicted by a pestilence, were told by the oracle of Apollo that the pestilence should cease if they built him an altar cubical in shape and twice the size of the existing altar. This answer, it is said, perplexed the Delians, and they applied to the school of Plato at Athens, and it puzzled them also for a long time. The credit of a first solution, it is said, did not fall to an Athenian, but to a contemporary, Archytus of Tarentum. There is complete evidence, however, in the Parthenon that seventy years earlier, if the Delians had come to the Athenian architects instead of to the philosophers, they could have satisfied the demands of Apollo, for the cubic block of the stylobate is exactly one-tenth of the cubic block of the temple which it carries.

Falconet's Statue of Peter the Great.

The idea of Falconet, the French architect, commissioned to erect an equestrian statue to the extraordinary man at whose command a few scattered huts of fishermen were converted into the palaces of St. Petersburg, was to represent the hero as conquering, by enterprise and personal courage, difficulties almost insurmountable. This the artist imagined might be properly represented by placing Peter on a fiery steed, which he is supposed to have taught by skill, management and perseverance to rush up a steep and precipitous rock to the very brink of a precipice, over which the animal and the imperial rider pause without fear, and in an attitude of triumph. The horse rears with his fore-feet in the air, and seems to be impatient of restraint, while the sovereign, turned towards the island, surveys with calm and serene countenance his capital rising out of the waters, over which he extends the hand of protection. The bold manner in which the group has been made to rest on the hind legs of the horse only is not more surprising than the skill with which advantage has been taken of the allegorical figure of the serpent of envy spurned by the horse, to assist in upholding so gigantic a mass. This monument of bronze is said to have been cast at a single jet. The height of the figure of the emperor is 11 feet, that of the horse 17 feet. The bronze is, in the thinnest parts, only the fourth of an inch, and one inch in the thickest part; the general weight

of metal in the group is equal to 36,636 English pounds. Falconet determined that the subordinate parts should also bear an equal impress of genius. He found that the pedestals in general use have no distinctive feature, and adapt themselves equally well to any subject. A precipitous rock was fixed on for the pedestal, on which the statue should appear with characteristics distinguishing it from those erected to other sovereigns. The first idea was to form this pedestal of six masses of rock, bound together with bars of copper or iron; but the objection was urged that the natural decay of the bands would cause a disruption of the various parts, and present a ruinous aspect, while it would be difficult to insure perfect uniformity in the quality and appearance of the different blocks. The next proposal was to form it of one whole rock; but this appeared impossible, and in a report to the Senate it was stated the expense would be so enormous as almost to justify the abandonment of the undertaking; and even if made of six pieces, as first proposed, the outlay would be excessive. At length it was determined to transport to the city the largest rock that could be found, and add other portions to it as might be judged necessary. It is to be regretted that the effect of this unrivalled pedestal was marred by the diminution of its size. Under the directions of the artist, who had so successfully formed the statue, it was pared and chiselled until the weight was reduced to 3,000,000 lbs.; and the outline, instead of being left bold and broken, as best suited the character of the group, was made smooth and uniform.

Merchants' Marks.

Persons of the middle class, not entitled to coat-armour, invented certain arbitrary signs called merchants' marks, and these often occur in the stonework and windows of old buildings, and upon tombs. Piers Plowman, who wrote in the reign of Henry III., speaks of "merchauntes' markes ymedeled" in glass. Sometimes these marks were impaled with the paternal arms of aristocratic merchants, as in the case of John Halle, a wealthy woolstapler of Salisbury, rendered immortal by the Rev. Edward Duke in his "Prolusiones Historice." The early printers and painters likewise adopted similar marks, which are to be seen on their respective works. A rude monogram seems to have been attempted, and it was generally accompanied with a cross, and occasionally a hint at the inventor's peculiar pursuit. The heralds objected to such marks being placed upon a shield; for, says the writer of Harl. Manuscript 2252 (fol. 10), "theys be none armys, for every man may take hym a marke, but not armys without a herawde or purcyvaunte;" and in "The Duty and Office of an Herald," by F. Thynne, Lancaster Herald, 1605, the officer is directed "to prohibit merchants and others to put their names, marks or devices in escutcheons or shields, which belong to gentlemen bearing arms and none others."

Greek Heating.

Homer describes his princes undressing themselves in the palace, to kill with their own hands the sheep, oxen and swine they were to eat at dinner; roasting the entrails, and during the entertainment handing them to each other as delicacies. The repast being finished, he shows them sitting for their pleasure on the piled skins of the animals they had slain and devoured, and playing at games of chance, and one of them taking a pastern bone out of a basket in which it was lying, and throwing it at the head of a beggar, but on missing its aim, making a grease spot where it fell on the opposite wall. From this picture of the grossness of ancient manners it may be concluded that when the poet says Penelope's maids threw the glowing embers out of the braziers upon the floor and heaped fresh wood upon them, he did not mean to depict his immortal barbarians burning odoriferous fuel on purpose to sweeten what must have been a vitiated atmosphere. The fire that was quickly to blaze on the hearth had to diffuse the comforts of light as well as warmth; and the fragrant logs were known to abound with the resinous material of illumination. In the heroic age they had oil and tallow in abundance, but were ignorant of the method of burning them in lamps; and the only use they appear to have made of wax was to put it in the ear to shut out sound. Burning fuel was carried into the apartment where light was required, and sometimes placed on altars for the same purpose; and long thin pieces of lighted wood were carried in the hand when they moved from one place to another in the night. Coal, it has been thought, was known to the Greek naturalists. Theophrastus speaks of fossil

substances found in Liguria, and in Elis, in the way Olympia, and used by smiths, that when broken for use are earthy, and that kindled and burned like wood coals. The general fuel was green wood, and where that was unattainable other vegetable and even excrementitious substances were used on the hearth for combustibles. On days of ceremony it was also customary to burn fragrant substances. When Alexander the Great was at an entertainment, given in the winter by one of his friends, a brazier was brought into the apartment to warm it, the day being cold, and the king observing the small quantity of fuel that had been provided, jeeringly desired his host to say Plutarch, "to bring more wood or incense," the supply of the precious firing appeared to the king to be scanty for producing the required warmth; and if it arose from his host being niggardly of the costly fuel, he hinted that some even of the common sort would be acceptable.

"BE GENTLEMEN."

A SPECIAL committee of the Boston Society of Architects, consisting of Messrs. Robert S. Peabody, Edwin J. Lewis, jun., and Frank A. Kendall, appointed to consider the annual report of the retiring secretary,* have, according to the *American Architect*, discussed its most important suggestions as follows:—

The proposed adoption of a mandatory inflexible standard of practice regarding the furnishing of sketches to prospective clients is a far more puzzling question, and it is evident that such action cannot be effective unless it has the endorsement and support of every member of the Society.

All of us have noticed that the number of competitive bids has increased of late, and that there is increased willingness on the part of architects to volunteer sketches without payment. This condition partly arises from dulness in business throughout the country, combined with a great increase in the number of practising architects that our many schools have trained. Is this condition hurtful or advantageous to the individual? If it is a trouble, can it be lessened? Will resolutions on the part of the Society bring about a better condition? These are the rather searching questions on which, as we understand it, you wish a report from us.

Why is it that we all think an architect is not all that he might be if he competes without compensation, or, what has a similar effect, if he cuts the usual rate of charge? There is nothing immoral about either of these things unless while doing them one pretends that he does not do them. In what way, then, does an architect differ from a grocer who undersells his neighbour until his profit is the slightest? In what respect is he like the doctor who does not do so? How does the doctor differ from the apothecary who does cut his neighbour's prices?

These are difficult questions to answer. They lead to ask, What is the real underlying principle on which the professional spirit is based, either in the three old-time "learned professions" or in those that are struggling to place on a level with them? Is it perhaps based on the fact that professional men sell ideas instead of goods, drawings but design, not sermons but good counsel, medicine but sound advice? Is it perhaps founded more on the fact that to professional men bread-winning while it is a necessity of life, is not after all what gives them delight in the work each loves? Is it perhaps due to the leadership through intellect which should fall upon men in the professions?

We may not be able to state with exactness the reason why a high professional spirit actually exists among us, but the main fact is that happily it does so exist, and it exists

* NOTE.—The suggestion made by our ex-secretary was as follows:

I should like to find a general sentiment in the Society in favour of the following propositions:

"After three years of independent practice no member shall volunteer sketches or other professional assistance.

"No member shall furnish sketches without compensation less assured that he alone will be invited or permitted to do so. If other sketches are received he shall, claim a proper payment least sufficient to cover the reasonable cost of his drawings.

"No member of the Society shall, either personally or through another, submit sketches except as above, or in a proper competition (with professional adviser to assist in preparing the programme and judging the designs), or for an adequate payment according to the schedule of the A.I.A."

so with strength and life; and we all, young and old, feel and prize it. It does not matter on what reasons it rests. We have it and we want to nourish it and are willing to sacrifice for it, believing, too, that such sacrifice results in ultimate gain. Dignity does not come without some such sacrifice. *Noblesse oblige*, and "hustling" is not consistent with the truest dignity. To abstain from improper conduct is not only the price of a dignified position, but is a part of it. How far, then, should this professional spirit prevail among us in opposition to commercialism? What can the profession do about this whole subject?

Is not our position towards the public essentially that of a doctor towards his public, which is thus stated in the Medical Code of Ethics:—"The relation of practitioners of medicine to families and households is not like that of tradesmen to their customers. The kind of competition which might be considered honourable in business cannot exist between physicians without diminishing their usefulness and lowering the standard of the medical profession." "In his relations with another medical practitioner and his patients a physician should be governed by strict rules of honour and courtesy. His conduct should be such, if universally imitated, would insure the mutual confidence of all medical practitioners." This surely applies in respects to our own profession, and in great measure covers the subject under discussion.

The resolutions that are suggested by our ex-secretary properly indicate that the point of view of a youth and an older man may fairly be different. The youth wants to get started and sets less store by dignity than the older man. This difference must be reckoned with in any generous discussion of the subject. It is urged that a youth has no recognition if he takes the same stand that may fairly be required of older men; but who can fairly say that in this city and country? You have but to look around to see large numbers of young school graduates, fellowship men and Rotch scholars gaining prompt praise and reward for work obtained in legitimate ways. The public is always asking the best. Certainly we should be in the wrong for our professional habits and customs bar out youth. But we do not think that is the spirit of the profession. Our sympathies are heartily with eager and accomplished young architects. We recognise their difficult questions as conduct. The question of conduct is perhaps never harder than when a young man, thinking he has some work well in hand, is told by his committee that older men are clamouring for present sketches without pay, and that he must do likewise or lose his work. Our sympathies, it is unnecessary to say, are not with the architect who thus gets ahead of his fellows. Still, your committee cannot accept the position suggested by the resolutions—that there may be a period of probation during which youth may properly sow wild oats regardless of the interests of others and of his own ultimate interests. Youth should await opportunities that may be offered upon with reasonable dignity. Surely the only proper attitude towards these matters is one that is proper for all.

Nor does your committee believe that this is a matter that can be regulated by vote of the Society. Certainly such a vote cannot bind a dissenting minority. It is true that the consent of every member might possibly be obtained, and a new association might be formed which would accept certain obligations as to competitions and sketches and rates of compensation, but such a combination or trust would invite grave criticism from the public, and would surely be defeated finally by one or more architects who would not be bound by the trust, or by invaders from other cities. Your committee believes that any such trust is as undesirable as the combination which it is meant to remedy is undignified. They believe that these troubles will continue to a greater or lesser degree as long as business is a matter of competition instead of co-operation.

In short, your committee does not believe that you can suppress selfishness by rules or bind architects, as the secretary suggests, by a hard and fast resolution of the Society. The experience of every one of us shows that there are occasions when any individual would wish to break such a rule, and might do so with perfect self-respect and with the approval of his fellows. We cannot force observance of a rule that is more exacting than the profession at heart believes in, but we can urge on young and old that selfishness works to the general harm and is undignified and undesirable.

Your committee, therefore, believes that the only remedy for these evident evils is moral suasion. They think it should not be too often said and repeated that a commission

of 5 per cent. has been long agreed upon as a moderate bread-winning commission for work properly done; that a less charge is unremunerative; that a greater charge is perfectly proper for those whose skill makes them able to obtain it; that anybody who cuts these prices by lowering the rate is really breaking the lowest remunerative market price; that to volunteer, without pay, sketches and competition work is also practically cutting prices, as when a 5 per cent. commission was established as usual and proper for ordinary professional services it was never intended to cover expenditures for obtaining work; that if an architect does this, whether he is young or old, he will earn the name among his fellows of being unduly selfish. He will, in short, be a "hustler," and will have to take the odium that attaches to the name along with work thus gained. Young or old must be generous gentlemen, or else bear with others who find them selfish and greedy.

Practically, a code is complete when it says, "Be a gentleman always and in addition as good an architect as possible." That is the substance of the attorney's oath or of the Medical Society's code. It is when we consider details that our troubles begin, and, in fact, the ultimate guide must always be one's own sense in each case of what is decent and proper. The man who respects himself will be the most respected, but a hard and fast rule as to these details cannot be made and will not be regarded.

Your committee believes in stating our belief regarding this whole matter as fairly and squarely as we can see it, rather than in shirking the truth as to our belief and our practice and leaving our position vague and unexpressed. In view, therefore, of what has been said, your committee recommends the omission from our Code of Ethics of Sections 5 and 10, and the substitution thereof of the following, immediately before section which relates to unbidding other architects:—

"Section —. This Society is not a trust or trade union, and does not fix rates of charges to be made by its members. It has, however, recommended to architects and to the public a schedule of charges that through long experience have been found to be the minimum rates that yield a reasonable profit. Any member whose skill permits him to obtain it may reasonably charge more. Those who charge less break the lowest remunerative price and act contrary to the interest of the profession, and in the long run to their own interest.

"The regular rates of commission do not cover competitive work to obtain employment. This should be paid for separately. If such work is done without charge the result is the same as the charging of less than the schedule rates, and is in the same way undesirable and undignified. Such practices diminish the usefulness of architects as unprejudiced advisers and lower the standard of the architectural profession."

Re Waterproof Concrete.

SIR,—We have read with very great interest in a recent issue of your paper of the introduction of a cement "Made in Germany" that would render concrete roofs absolutely waterproof, and were not the least bit surprised that the firm who obtained the English rights, according to their own statement in a later issue, found it to be no better than ordinary cement, hence as a waterproof material a failure. But Messrs. Watson & Co., in order to demonstrate the excellence of their lead and bitumen damp-course, were bold enough to state that one reason of its superiority was that it did not "curl or blow like asphalt." If this has been the experience of Messrs. Watson & Co. in their use of asphalt they must have been most unfortunate in the selection of their material and labour, for without doubt asphalt laid under proper conditions by skilled labour and with proper regard to quality of material used is the only absolutely safe waterproof material. It is unhappily true in these days of competition that inferior brands of asphalt are used, with the result that bad work is turned out, but with a little trouble anyone requiring best class work in asphalt can get recognised brands that will not "curl or blow," but will stand all the fluctuations of our climate, and make any roof perfectly watertight for a guaranteed term of years.

After many years' experience in every variety of waterproof material, we hold firmly to the opinion that for roof-work asphalt is absolutely the best material that can be obtained.—Yours faithfully,

THOMAS FALDO & Co.

Somerset Wharf, Rotherhithe Street, S.E. :

March 15, 1905.

St. John's Gate, Clerkenwell.

SIR,—The hall at St. John's Gate, of which a beautiful illustration appeared with your last week's issue, is quite a modern structure, having been built only about two years ago as an annexe to the old building; but it is worthy of the best traditions of the Mediæval period, with its wainscotted walls, groined ceiling and parquetry floor, which are all of oak.

The gateway was rebuilt in the year 1504 by Thomas Docwray, then Prior of the Order, who thus completed the work of restoration, which had been continued since the time of the destruction of the Priory by fire in the year 1381. The external face of the stonework had since become seriously deteriorated, and it was decided that the fabric should be completely restored as a memorial to the first sub-Prior of the Order since its reincorporation by Royal charter. The armorial shields on the south side were found to be wholly defaced, and it was considered that the restoration might in this instance take the form of a panel of entirely new shields, with a suitable inscription recording the memorial. This was unveiled in June 1893 by the King, who was then Grand Prior of the Order.

The restored Brotherhood of the once world-famous Hospital of St. John of Jerusalem, whose headquarters are at St. John's Gate, is, as has been well said, "a striking and accurate revival of one of the most picturesque and influential groups of the most gorgeous and brilliant society the world has ever seen—the Society which lives in the stirring stanzas of the Roman de Rose, and along the glowing lilt of *trouvère* and *troubadour*. It is pictured in the brightly coloured pages of Froissart and Monstrelet; we seem with the old ornaments and quaint symbols and half-forgotten titles of honour to live again in the Courts of the Plantagenets, in the ranks of the chivalrous Crusaders."

I would also point out that the St. John Ambulance Association, which is a practical philanthropic and national institution, has its head offices at St. John's Gate, and that it had the honour to be incorporated in 1888 with the Order of the Hospital of St. John of Jerusalem in England as one of its principal departments, when it was made subject to its laws and regulations.

At the period when St. John's Gate was a tavern, I may add, it formed the home for a number of years of the Urban Club and of the Shorthand Writers' Association, in connection with which there are still some living who cherish very pleasant reminiscences of evenings spent within the ancient portals, when "the feast of reason and the flow of soul" was freely indulged in to the heart's content.—Yours obediently,

J. T. RAWLINGS.

GENERAL.

The Students of the modelling school in the Royal College of Art, South Kensington, will submit sketches for four of the sculptured figures required in the new buildings in course of erection. If approved the work will be carried out under the superintendence of Professor Lanteri.

The Excavations in the Abbey Field behind St. Augustine's College, Canterbury, are to be continued. The field, which was purchased in 1900 on behalf of the Church of England, comprises about three acres, and includes part of the site of the old Benedictine monastery founded in 598 by King Ethelbert and St. Augustine.

Commendatore Alberto Galli, the director of the Vatican Museums and Galleries, will be present as representative of the Holy See at the inauguration on April 8 at Aberdeen of an exhibition of plaster casts showing the history of sculpture.

The Recent Exhibition of Irish pictures at the Guildhall Art Gallery was visited by 72,268 persons. Catalogues to the number of 6,315 were sold, and the total expense was 694*l.*, less 157*l.* received from the sale of catalogues. The Dublin authorities guaranteed 750*l.* for the purpose of the exhibition.

The Project for converting the High School, Edinburgh, into a National Gallery has been abandoned by the authorities.

Various Sculptured Relics, historical mosaics and other remains of archaeological interest, discovered by M. Legrain at Luxor within the past year, are being transferred from the Temple of Karnak to the Kasr-el-Nil Museum, in Cairo.

The Entrance Gateway to the Inner Temple from Fleet Street has been temporarily closed while the alterations the widening of the street are being carried out. The gateway will be moved back several feet.

The Simplon Tunnel is to be formally opened on Tuesday next, the 28th inst. The Duke of Genoa, as representative of the King of Italy, will meet the President of the Swiss Confederation at the point in the tunnel where the two territories touch.

An Exhibition of the works of the late G. F. Watts will be opened in the City Art Gallery, Manchester, on May 2 and will continue until July 15. There will be no charge for admission.

The Incorporated Association of Municipal and County Engineers have announced their intention of issuing quarterly, in pamphlet form, to all members, associates and graduates of the Association, a digest of law cases, arbitrations, &c., bearing directly upon the work of the municipal and county engineer and surveyor.

The Bill which it is expected will be promoted by the Royal Institute of British Architects for the registration of architects has been drafted and is in print, for the consideration of the registration committee appointed by the general body of members of the Royal Institute. We hear that Fellows who are in favour of registration will be proposed for the offices of vice-president and honorary secretary of the Institute, as well as for ordinary members of the Council at the forthcoming elections.

The London County Council have decided not to place a commemorative tablet on one of Turner's residences because two of his other homes have already been marked in this manner.

The Leeds Art Club is taking an expression of opinion on the question, "What in your opinion are the ugliest things in Leeds?"

Mr. J. M. Swan, the animal painter, was on Wednesday elected a Royal Academician, in succession to the late G. H. Boughton.

Mr. Samuel Joseph Nicoll, architect, died on Tuesday, his seventy-ninth year. He designed several Roman Catholic churches, some of them being in a modified Romanesque style.

A Treatise on "Roofs and Floors of New Buildings: their Structure and Stability," by Mr. Ernest H. Essex, C.E., will shortly be published by the St. Bride's Press, Ltd.

The Mayor of Burslem has made a gift of 700*l.* towards the erection of a new art school, in addition to his present donation of a site valued at 5,000*l.*

The Aberdeen Town Council have decided that Corporation official be allowed to engage professionally any other work than that connected with the Corporation unless with the consent of the Council.

The Italian Minister of Public Works has vetoed the proposed demolition of the Lucca city walls by the Town Council for the purposes of expansion.

The Leicester and Leicestershire Society of Architects at a meeting on the 15th inst. passed the following resolution: "That we, the Leicester and Leicestershire Society of Architects, at a general meeting called to discuss the subject of statutory qualification and registration of architects do reaffirm our resolution of June 3, 1904, and are of opinion that it is the duty of the Council of the Royal Institute of British Architects, as representing the profession to make serious and immediate effort to obtain Parliamentary powers for the purpose of establishing statutory qualification of architects."

A Misunderstanding has arisen regarding the Clapham baths which are to be built for the Wandsworth Borough Council. The accepted design was prepared by Mr. Henry Drury, M.S.A., architect, 26 Great James Street, Bedford Row, W.C., who was responsible for the architectural work, and by Mr. E. R. Dolby, M.Inst.C.E., of the firm of Messrs. Dolby & Williamson, consulting engineers, 8 Prince's Street, Westminster, S.W., the latter gentleman being responsible for the design of the engineering work. The Wandsworth Borough Council are employing Messrs. Drury and Dolby to carry out the work, and have instructed them to prepare designs for the proposed Toot baths. There is no such firm as Messrs. Drury & Dolby and these gentlemen are only connected in the manner described above.

VIEW FROM THE SOUTH EAST.

This was some years ago the appearance of the little tower to the west of the church; it was roofed in and used for storing corn in.

The former spire.

SIR R. ROWLAND ANDERSON, LL.D., Architect.

The Architect.

THE WEEK.

It would be an advantage if the Courts could be persuaded to define what is a mineral in law. In leases and other deeds there are reservations of minerals to the landlords, and many lawsuits arise out of the difficulty of interpreting the term. Strictly speaking, a mineral is an inorganic body having a definite form and position, but in ordinary language it is taken to mean any unorganised substance found in the earth or on its surface. The decisions of the Courts do not always agree with either of those definitions. A test case in the Irish Courts affords an example. On a tenant's land were granite boulders, which he used for building stone. The landlord claimed damages, as minerals under the Land Act were reserved to him. The Judge of the County Court decided in favour of the tenant on the ground that boulders were not minerals, but the decision was confirmed in the higher Court. It is considered to be indisputable that granite is a combination of minerals, and unless we are mistaken in our notions to that effect have been given by judges, we have to assume that granite in the form of boulders is not a mineral, and is a nuisance which a tenant is entitled to remove.

EDWARD DALZIEL, who died on Saturday evening in the eighty-eighth year, was one of the last of the woodcutters. Since 1839 he was well known in London. Most of the men of his class were satisfied with their work, but the DALZIELS were more enterprising, and they only became heads of an establishment for the production of woodcuts, but they got out books to serve as a medium for their illustrations. The Brothers DALZIEL, besides engraving, sometimes drew upon the wood. But in such cases their work was inferior to that of other engravers. As they were connected with a great many different styles their work was necessarily varied, and it is difficult to determine what was their favourite style, as can only be done with HARVEY, W. LINTON and others of their contemporaries. EDWARD DALZIEL being courageous, departed from his legitimate field of wood-cutting, and his experiments were not always advantageous to art.

THE one-storeyed houses which Englishmen erected in India were intended to obviate the shortcomings of the buildings which the natives occupied. When bungalows were erected in England, the only resemblance to their Indian prototypes was in the avoidance of a second storey. The rule was not always observed, and it is possible to find many bungalows which have two storeys, and a larger area than ordinary houses. The name now appears to captivate people, and in consequence there is a desire to erect them as temporary habitations in picturesque districts. In some of the towns which have not yet become fashionable bungalows are to be seen on the beach quite close to the sea-line. A difficulty, however, arises with regard to their construction. To the owners there may be something attractive in having them constructed at an inexpensive rate. As they are only used in fine weather it is supposed that thin walls or partitions would suffice, and there is a partiality for timber construction. But the by-laws cannot tolerate such concessions to fashion. If labourers' cottages are subjected to strict rules it is not reasonable to exempt bungalows, which belong generally to rich people. Petitions are, therefore, being sent to the Local Government Board asking for concessions from various rural authorities. It is suggested that the thickness of walls, height of rooms should in all cases approved by the councils be allowed to differ from the by-laws, and especially when the bungalows are not placed close together and the danger of the extension of fire need not be calculated.

THE disaster which follows the bursting of the dam of a large reservoir is so serious, and the causes are so difficult to discover, it is no wonder theorists have for several years investigated the formulæ on which such construction is based, in the hope of discovering lines of pressure which will be more accurate than those in use. According to RANKINE, in a structure exposed to the overturning action of forces which fluctuate in amount and direction there should be no appreciable tension at any point of the masonry. But it stands to reason that if water finds admission in certain directions it must exert an uplifting and overturning pressure. All dams are calculated to sustain a certain amount of water. If it is desired to increase their capacity it is necessary to raise the height of the dam. It may then happen that the direction of the lines of pressure will be altered, and that a dangerous result will follow. The catastrophe in Epinal, when the Bouzey dam was actually overturned, is evidence of how little can overcome the stability of a dam. We can therefore understand the alarm which has been excited by the hesitation to raise the Assouan dam. The Bouzey dam slipped, and it is not impossible that the foundations of the Assouan dam might also move if the conditions which at present exist were altered. The authorities are acting wisely in waiting, because the great dam has been so lately constructed, all the conditions can hardly be said to be known. It has to be acknowledged that there is a "scour," and precautions have therefore to be taken in protecting what is sometimes called the toe of the dam. It is, however, absurd to say that any new discoveries have been made respecting the theory of dam construction.

A CASE relating to an error in a tender has been determined in Scotland. The owners of some property in Stonehouse were desirous to have it reconstructed. They issued schedules. Messrs. WEIR & HAMILTON, builders, filled in one of them in which they charged for one item at a rate of 1s. 6d. per yard. On the completion of the work it was measured in the way that is usual in Scotland, and the measurer altered the rate from per yard to per foot. The full amount was paid. Afterwards the error was discovered, and the building owners took an action to recover 78l. 1s. 3½d., the amount of the overcharge. The builders pleaded that they supposed the item in the schedule related to a foot-rate. They also counterclaimed a sum of about 18l. for extras, errors in measurement, &c. Sheriff THOMPSON, who heard the case, came to the conclusion that the building owners had nothing to do with the error, that they accepted the builders' tender without knowing of the error and without fraud on their part, and finally that the builders were bound by the contract. The counterclaim was set aside, and judgment given for the full amount overpaid.

THE report of Mr. GOLDSTRAW, the building surveyor, shows that whatever may be the state of trade in Liverpool a great number of buildings were erected during the past year. The new dwellings number 2,174, the larger number being in the West Derby district. The number of workshops, stables and minor buildings was 110, besides forty-one public buildings and manufactories. Efforts were made to have means of escape from fire provided. There are many buildings which at present the Corporation cannot interfere with. But the Home Office is now conducting an inquiry on the subject. Means of egress from public buildings is another subject which has engaged attention. It was necessary to take down 293 houses on account of dilapidations; of these 111 were demolished owing to the action of the housing committee. Out of 1,158 plans which were submitted only ninety-nine were disapproved.

LANDSCAPE IN MURAL DECORATION.

THERE was reason for the complaint of Mr. ALFRED EAST that landscape art had been neglected by architects as a medium for mural decoration. In the paper which he read last week before the Institute he said that his art was kept strictly in the background. He could have added that almost from the beginning of the history of architecture the advantages which paintings of scenery offered were unrecognised. Indeed, modern architects might set up as an excuse the plea that they had been strictly following the advice of the great lawgiver VITRUVIUS. In his time an artist named LUDIUS introduced the fashion of ornamenting rooms in Roman houses with landscapes, seascapes, forest scenes and still life. VITRUVIUS bewailed the change, because, as he affirmed, the subjects for wall-paintings had been always derived from the history of gods and heroes, and he feared the grand style was at an end.

The lament of VITRUVIUS shows the extraordinary influence which custom can exercise over clever men. He gave no reason for the preference in an architectural sense of mythological legends. No doubt in temples subjects of the kind might be apposite. In the public buildings of Rome it would also be fitting to have representations of historical incidents connected with the city or of the myths which suggested that some divinities were desirous of its prosperity. But there could be no æsthetic canon against the employment of landscapes in other buildings, for they would be more easily adapted to fill wall spaces than figure-pieces.

The Romans no doubt imitated the example of the Greeks; but the circumstances which caused figure-subjects to be preferred in Greece did not prevail in Rome. The early Greek paintings were executed in conventional colours which were prescribed, and that system was adhered to during a long period. Custom prevented the critics from observing the unnaturalness of painting a man or a woman with vermilion. But a system of that kind would appear ridiculous if applied to landscape, although some Roman examples denote that the colours of the landscape were occasionally subordinated to the colour of the wall. There is no doubt that landscape-paintings for wall-decoration were sometimes produced, although the landscape was made subservient to the figures. This is evident from the descriptions by PHILOSTRATUS. He mentions a painting of the Nile in which children and other attributes were introduced, an arrangement which recalls the famous group in marble. Of other pictures there is enough related to suggest that some of the characteristics of land and sea were represented.

We should remember that the Greeks, with all their susceptibility, do not appear to have given much attention to the beauty of nature. To the artist, man was the measure of all things; and the Greek legends offered innumerable opportunities for presenting figures of men and women in groups that would add to their interest. Sculpture, however, obtained precedence over painting as a medium for the display of beauty and power. As a consequence, perspective was neglected. It was therefore difficult to represent landscape in a way that would recall an actual scene. It is always much easier to describe a view than to paint one. But neither in the prose nor poetry of the Greeks do we find any recognition of the picturesqueness of Greek scenery. Splendid opportunities were offered, as in the "Prometheus," to describe a wild mountain region, but the dramatist was unable to take advantage of them. It is possible that the Greek mind, with the instinct for order, regularity and symmetry, could not appreciate such scenery as would be essential to the imaginary Caucasus, where PROMETHEUS was bound. The Greek looked on land with the eyes of a farmer, and cared only for its fertility.

Men, however, are compelled, in spite of themselves, to change their opinions about life and nature. A comparison of the "Iliad" and the "Odyssey" with the

"Eclogues" and the "Georgics" will show how different the world appeared to the Roman and to the Greek poet. VIRGIL evidently was able to realise the importance of the earth for much else besides produce, and it is obvious he enjoyed its beauty, and could happily in the country away from the capital. Nature is remarkable, although critics do not seem to have noticed the fact, that VIRGIL was a contemporary of LUDIUS, the landscapist, and we thus find a like manifestation in contemporary poetry and painting. It is also possible that in spite of the opposition of conservatives like VITRUVIUS more landscapes were produced by Græco-Roman artists than is generally known. A few of the works of that period have escaped, and are figure-pieces. The barbarians would be likely to prefer them to pictures of scenery.

With the Christian era it could not be said that man became more enamoured of the earth than in the time of the Greeks. The latter were utilitarians, and looked on land as on a slave, while the Christians found the earth as a place of exile and temptation. The places selected by anchorites were generally deserts where monotony prevailed. What chance had landscape art at such a time? Paintings of vineyards were necessary as expressive of the doctrine, and trees were frequently introduced in church walls between figures of saints in friezes. In the course of time conventional landscapes became usual, and the painting in the Sistine of the *Calling of St. Peter and St. Andrew*, by D. GHIRLANDAJO, shows remarkable powers in treating a varied if conventional background. LORD LEIGHTON considered that the revival of landscape art, or, rather, its re-creation in form beyond anything which existed previously, must be attributed to the influence of a scientific spirit which characterised the Renaissance. He said:—"By the side of this scientific fever the joy in rediscovering nature manifested itself in a new delight in landscape. The summary indication of earth and vegetation which sufficed to the school of Giotto, soon gave place to an almost undisciplined exuberance of treatment. Who does not remember the riot of hill and dale, tree and shrub, of vineyard and pleasure-ground, of men and beasts, in which, on certain walls of the Camposanto of Pisa, GOZZOLI, for instance, celebrated the joyous spectacle of the world? And when to this sense of simple gladness is added the spirit of scientific inquiry which I have spoken, we get such amazing studies of leaf and flower as LEONARDO loved to draw. Through the Tuscan artists the new movement brought the love of nature and the light of science." Whether the credit of being the first to reveal the beauties of nature should be assigned to GOZZOLI, MASOLINI or MASACCIO is a subject of controversy.

TITIAN, we suppose, was the first who can be considered as utilising landscape not merely as a ground to give relief to figures, but as an auxiliary to the subject represented by them. If the trees were removed from the *Peter Martyr* or the picture of the two monks, much of the interest would vanish. He gave a new interest to landscape art. The desire to produce examples was so general in Italy, a factory was started in Antwerp for their manufacture. The Bolognese school entered into competition with the Flemings. Several examples are to be found on the walls of churches and palaces in Italy. Indeed, landscapes occasionally be seen in some of the Belgian churches, and they were probably intended to represent scenes in Palestine.

Although there are far more precedents for the use of figure-paintings in decorating buildings, it does not follow that modern times should be compelled to be bound by them. Why should the province of decoration be restricted because Greek artists were ignorant of perspective? Nature, moreover, is now regarded very differently to what it was either in Classic or Mediæval days. It would not be possible in any Greek or Roman dramatist to find so many admirable descriptions

s of landscapes as we have in SHAKESPEARE'S plays. RON was not afraid to create scenes which are more time than any painted by TITIAN. The history of nature offers no prototype for WORDSWORTH. Land is not alone in representing modern ideas of nature. France has shown some indications of the same kind, although subjected to a perverse, official system. Germany has in some ways gone beyond England, for observation has been impelled by various systems of philosophy to try and pluck the truth out of the mystery which surrounds the earth. France, however, deserves the credit of being more consistent than either England or Germany, for it enjoys views of town and country for decoration as the most important kind.

In this country people are glad to buy landscapes to hang them on their walls, but there is still a large fear of using them as subjects for the decoration of buildings. This is to be partly explained by the facts concerning the necessity of pictorial decoration. Only sixty years have elapsed since the proposal was made for the decoration of the Houses of Parliament with wall-paintings. The committee who had charge of the project were all serious men, and they could not think of anything more fitting than the representation of historical scenes which would instruct the people who looked on them. It might be supposed that books did not exist. The Germans had also about the same time covered big walls with historic scenes, and it was proved we could have no better exemplars. It would be interesting to discover how many of the visitors to the Houses of Parliament have been enlightened or moved by what remains of the wall-paintings. Indeed, with such failures before him, it is courageous of a part of an English figure-painter to advocate his work. It is needless to say that in not one of the paintings was the least attention given to the style of building or the colour of the materials used in the interior, which should be the first thought of an architect who understood his business.

As in the Houses of Parliament, the primary use of decoration is to appeal to children and ignorant people, then we suppose the commonplace representations of incidents deserve to be taken as models. But if decoration is to enhance the interest of a building, and to afford pleasure, then a different class of subject is advisable, and those which can be produced by landscapists should be accepted as eligible. Parisians have done so in their Hôtel de Ville and other public buildings. Some of the panels recall scenes in Paris or in the surrounding district. It is pleasing to the eye to look on a reposeful stretch of country than on a scene of carnage, and a glimpse of green trees, sparkling waters and brilliant sunlight is preferable to the incidents with which the majority of historical painters seem to be enamoured. Then landscape has an adaptability to spaces, however restricted, which is not possible when using figures. It also, as Mr. EAST pointed out, conform to all variations of scale and colour. No doubt custom has made people feel that landscape is unsuitable for decoration. But it should not require many experiments to prove before that conclusion would be altered.

It cannot be expected that in treating landscape for a particular purpose detail is to be expressed, nor is it necessary. General effects are all that is desirable, and the artist works on a grand scale. As HACKERT says, man does not seek in detail for the truth of nature. A landscape is recognisable at a distance without putting one under a microscope. Indeed, it is this quality which makes landscape peculiarly adapted for the purposes of mural decoration. There is, too, the advantage, and it is a great one, that in landscape there is no need to perpetuate lies. Among all the historical paintings in the Houses of Parliament only the two by NELSON and WELLINGTON by MACLISE have claims to be regarded as faithful. The artist took enormous pains to attain accuracy of detail, but experts

say he failed. The other paintings are all imaginary, and therefore deceptive. A building is, or should be, an embodiment of truth. If it were otherwise, it would fall to pieces. It is therefore wrong to have its adornment made up of lies, although supposed to be sanctioned by the name of art. Far better would it be to substitute views which would recall the source of the materials of which the building is constructed.

BUILDING OWNER'S RIGHT TO PLANS.

IT was remarked by counsel in a case which was heard a few days ago that England was a free country, to which the reply of the Judge was, "but, subject to law." The words are applicable to architects, and especially when they refer to the retention of plans which are claimed by a building owner. They, like other men, are free to act, and may refuse to part with their plans, but there is no escaping the law on the subject if it should be put into action. It should be remembered that the law takes no special cognisance of architects either as artists or as members of a profession. Surveyors and builders are supposed to have certain duties to perform, but the office of an architect may be said to be unsupported by any Act of Parliament. In that way they resemble the majority of citizens.

One of the consequences is that when a case arises like *GIBBON v. PEASE*, which was heard before the Court of Appeal on Friday last, there are few precedents for the guidance of the Court. When first heard by Mr. Justice RIDLEY, he came to the conclusion that he was bound to follow the decision in the solitary case of *EBDY v. MCGOWAN*, and decided for the plaintiff. The argument for the defendant on appeal was that the circumstances in *EBDY v. MCGOWAN* differed from those in *GIBBON v. PEASE*. Their lordships, consisting of the Master of the Rolls, Lord Justice MATHEW and Lord Justice COZENS-HARDY, also came to the conclusion that the two cases corresponded, and the appeal was dismissed. The inference must therefore be drawn that a building owner never applied to an architect for plans before Mr. MCGOWAN arose, or that architects did not insist on keeping plans until 1870. It may also be added that very few cases of other kinds are to be found which would throw a direct light on the subject. When it is maintained that an important professional privilege is at stake, and that architects are suffering under a grievance which is intolerable, it must be allowed that the records of the Courts do not bear out either supposition. As there are only two cases of resistance to a demand for plans, it cannot be said that much suffering has been caused.

The leading case of *EBDY v. MCGOWAN*, which is likely to become historical, differed from *GIBBON v. PEASE* inasmuch as the plaintiff was an architect. The defendant had given him a commission to build a vicarage. Plans and specifications were prepared. Before the contractor's work was undertaken, defendant put an end to the plaintiff's employment as architect. He then requested him to send in his account as well as the plans and specifications. Mr. EBDY made out his account, but defendant declined to pay unless he received the plans. There was no agreement about the retention of the plans. At the trial plaintiff gave evidence of the custom that in the event of the employment of an architect being stopped he was entitled not only to payment for the plans but to retain them. Lord Chief Baron KELLY said that if such a custom existed it was not reasonable, and there must be an express stipulation in the contract to that effect in order to make it acceptable in law. According to his lordship, it appeared contrary to reason, good sense, and justice that, in the event of a contract being put an end to, the architect should retain the plans for which he was entitled to be paid. Baron BRAMWELL agreed with the Lord Chief Baron. He said he entertained a very high opinion of architects as a

body. "But he contended that such a usage as had been pleaded was impossible. He described it in rather unusual language as perfectly suicidal, for as soon as it came into being it cut its throat by its own absurdity. Two or three gentlemen might say there was such a usage, but he would like to see the public in the box and hear what they had to say about it. The result was that the defendant obtained judgment in his favour.

The circumstances in *GIBBON v. PEASE* were supposed to be different. The plaintiff claimed the plans prepared for him by the defendant for the conversion of some houses at Bayswater into flats. The work was executed, the architect's fees were paid, and then application was made for the plans and specifications. As they were not given up, an action to recover them was brought, and, as we have already said, the trial came before Mr. Justice RIDLEY. Evidence was given that, according to custom, the plans belonged to the architect. Mr. Justice RIDLEY would not admit the evidence, believing that the case was governed by *EBDY v. MCGOWAN*.

When notice of appeal is given after a trial it is generally on the ground that there are other judgments which support a view different from that taken in the case in question. But there is only one to rely on in respect to the ownership of plans. It was, we suppose, contemplated to create a new precedent which would override *EBDY v. MCGOWAN*. It might easily have been realised that, according to the principles of English law, when an architect receives money for the preparation of documents those documents correspond to other material products and belong to whoever paid for them. Under certain circumstances it may be possible to erect a building without plans. According to Sir GEORGE BIRDWOOD, that appears to be a custom in some parts of India. It may also be possible, as was exemplified in *KIMBERLEY v. DICK*, to prepare plans and enter into a contract for a building of a very different kind to that which was executed. But under ordinary circumstances drawings are essential for the carrying out of a contract, and the Courts must look on them in the same way as they would on the signatures of witnesses or on the affixing of proper stamps to a deed. Drawings and specifications are the grounds and data upon which the contract is usually founded. The drawings are therefore material things and not metaphysical abstractions.

The appeal in *GIBBON v. PEASE* was brought under the auspices of the Royal Institute of British Architects. That body, we suppose, inspired the plea adopted by counsel that a building owner was entitled to the benefit of the lines upon the plans, but that he had no claim on the sheets of double-elephant on which the lines were drawn. So refined an argument was worthy of the Academy of Laputa. It was also said that an architect was entitled to make use of his plans for other clients. That was, perhaps, the more amusing argument of the two. Does the Institute wish the public to imagine that plans or other documents which bear signatures of various kinds can be made the basis of a different contract with other signatures, and that such documents might on all occasions be presented in Court if there were lawsuits? Or was it a revelation that architects are disposed to repeat their designs without any alteration? The truth is, the appeal stood on grounds which were without strength, and it is no wonder their lordships did not call upon counsel for the plaintiff to reply to the novel arguments.

As might have been anticipated, their lordships had to rely on *EBDY v. MCGOWAN* because there was no other case available for that purpose. The Court of Exchequer had decided that even if the custom existed it was unreasonable, and that if plans are to be retained by the architect there must be an express stipulation between the parties to that effect. The Court of Appeal on Friday considered that if custom was bad in one instance it must be equally bad in the other, and the appeal was promptly dismissed.

It is remarkable that in both cases no damage could be proved as likely to arise to an architect by sur-

rendering plans to his client. Nor was it stated either of the building owners would gain any advantage from the possession of them. The litigation in cases was somewhat academic, and might have been carried on by JOHN DOE and RICHARD ROE if they were allowed to survive. Lord Justice COZENS-HARDY introduced the question of a possibility of damage to a party when he asked was a building owner who was in some difficulty about his drains or flues obliged to enter into a new contract with his architect in order to retain the position of those conduits? Hitherto a majority of building owners have been indifferent to plans. Perhaps they could not understand them, but must now be expected that they will take the suggestion from his lordship. Plans are likely to be regarded as a convenience, and possession of them demanded by architects. It will therefore be evident that no gain has been derived from the proceedings except a further demonstration of the position of architects. What, worse, the public who read the reports of the case, might conclude that architects are unreasonable and refuse to accede to the just requests of their clients. Under the circumstances, and especially after the remarks of Lord Justice COZENS-HARDY, it will not be wise to stipulate that a building owner has no claim upon the plans if it might be interpreted as an endeavour to evade the law of the land.

NATIONAL GALLERY.

ACCORDING to the report of the Director of the National Gallery the pictures purchased during the year were:—"Portrait of a Lady," by Bartholomew Van Helst; "Portrait of His Father," by Albrecht Dürer; "Portrait said to be of Ariosto," by Titian; "Portrait of the Actor," by William Hogarth; "The Virgin and Child with Saints," French school, fifteenth century.

Mr. George Gilbert bequeathed four works by the Sir George Gilbert, R.A., viz. "Old Gravel Pit in Green Park," "Bringing up the Guns," "Cardinal Wolsey and Duke of Buckingham," "The Happiest Land."

Sir Henry Thompson bequeathed his "Portrait," by J. E. Millais, Bart., P.R.A.

Other gifts were:—"Portrait of Paul Sandby, R.A., Francis Cotes, R.A.; "Outward Bound," by Sir Edwin Poynter, Bart., P.R.A.; "Landscape, Holmwood, Dorset," by Samuel Bough; "Kept in School," by George Leighton, R.A.; "Portraits of King William IV. and Queen Adelaide (a sketch), by Sir David Wilkie, R.A.; three ivory models used by Sir Francis Chantrey, R.A.; "Portrait of Peral," by Francisco José de Goya y Lucientes; "Portrait of Group of Mr. and Mrs. Edwards," by Henri Fantin-Latour; "Bust Portrait of G. F. Watts, R.A., O.M." by A. Gilchrist, R.A.; "A Reclining Nymph," by Sir Francis Chantrey, R.A.

The three following works of art were purchased for the National Gallery by the President and Council of the Royal Academy of Arts under the terms of the Chantrey Bequest:—"St. Silvestro," by Henry A. Pegram, A.R.A.; "London River," by C. Napier Hemy, A.R.A.; "Fate," by Arthur Wardle, A.R.A.

The two following pictures from the Chantrey Collection have, with the sanction of His Majesty's Treasury, been temporarily lent to the following institutions, in pursuance of a custom initiated by the Royal Academy, in response to a general desire that they might be seen in the provinces before being finally housed in the National Gallery of British Art:—"London River," by C. Napier Hemy, A.R.A., to the City of Liverpool Walker Art Gallery; "Fate," by Arthur Wardle, to the Royal Birmingham Society of Artists.

The portrait of Mr. Herbert Spencer, by H. Herkness, R.A., which was lent to the National Gallery in 1898, transferred in January last from the National Gallery of British Art to the National Portrait Gallery.

"The Yeoman of the Guard," by Sir J. E. Millais, Bart., P.R.A., has been transferred from the National Gallery of British Art, Trafalgar Square, to the National Gallery of British Art, Millbank.

The Gallery in Trafalgar Square was visited by 463 persons on the free days during the year, showing an average attendance on such days (210 in number) of 2. In addition to the above number, 33,128 persons visited

Gallery on the thirty-one Sunday afternoons on which it was opened during 1904, showing a daily average attendance of 1,068. On students' days (Thursdays and Fridays) 43,846 persons were admitted between January 1 and December 31, 1904; the admission fees (at 6d. each) amounting to 1,096l. 3s., as compared with 1,154l. 9s. received in 1903. The National Gallery of British Art, at Millbank, has been visited by 187,899 persons on the free days during the year, showing a daily average attendance on such days (210 in number) of 894. In addition to the above number 32,363 persons visited the Gallery on the thirty-one Sunday afternoons on which it was opened during 1904, showing a daily average attendance of 1,043. On students' days (Tuesdays and Wednesdays) 31,937 persons were admitted between January 1 and December 31, 1904; the admission fees amounting to 798l. 8s. 6d., as compared with 849l. 9s. received in 1903.

Copying Pictures in the Galleries.

The total number of students' attendances at the Gallery in Trafalgar Square on Thursdays and Fridays throughout the year was 15,489. Independently of partial studies, 675 oil-colour copies of pictures have been made, viz. 393 from the works of eighty-eight old masters and 282 from the works of twenty-two modern painters. The total number of students' attendances at the Gallery of British Art on Tuesdays and Wednesdays throughout the year was 7,732, and 288 completed copies of the pictures have been made in oil-colours and eighty-seven in water-colours and sixteen in pastel.

The most expensive addition is the Portrait of Ariosto, which cost 30,000l., and is thus described:—The portrait is of a man about thirty years of age with a golden brown complexion, long dark brown hair and a brown beard. The face is in three-quarter view, looking out of the picture with a somewhat scornful expression. His right shoulder is turned to the front of the picture with the arm resting on a parapet of a dark colour. He is dressed in a grey satin doublet, of which the large quilted and slashed sleeve is a conspicuous feature. Above the doublet is seen the edge of a pleated shirt, which leaves the neck and upper part of the shoulder bare, and is crossed by a thin gold chain. Part of a black fur mantle is seen on the further side of the figure and is held in the right hand, which is just visible in the shadow. The whole is relieved against a grey background of a warmer tint than the grey satin. On the parapet is the signature TITIANVS V., with another v at the further end of the parapet. This picture is supposed by Rowe and Cavalcaselle ("Life of Titian," vol. i. p. 198) to be the same as was in the Lopez Collection in the time of Charles I., and perhaps the lost original sent from Ferrara to Virginio Ariosto at Padua in 1554. On canvas, feet 7½ inches high by 2 feet 1½ inches wide.

INDIAN CRAFTSMEN.

A COMMUNICATION from Sir George Birdwood appears in the Journal of the Society of Arts containing further remarks relating to Mr. Hankin's paper on Mohammedan art:—"In expressing my personal opinion that Mr. Hankin pushed his ingenious theory too far, I stated that while in India I had employed all classes of craftsmen under my own eyes, and that on whatever work I employed them they never used any kind of design whatever. The designs in jewellers' books were mere advertisements for the attraction of Europeans, and never worked from. It was fatal to success to tell Indian craftsmen to work from a previous masterpiece of their own if you told them to produce it exactly, for in duplicating it with mechanical exactitude they destroyed all its artistry—the beauty and the life the artist's thought and sleight had given to it. The only way to possess yourself of your desire was to say:—'May God help you to devise another thing of beauty [sparkling, dancing, or prancing thing] like this you had for me before, of the same weight and size, and equally alive and exquisite [sparkling, &c., over again], and equally to my delight and your honour; and you know I shall not haggle over the price.' When you get all you desire, and better. It was always in that way I consulted and dealt with these craftsmen. I would never accept trash, and, without any bargaining, I always paid in cash; and for myself and friends I always secured the best 'Sidonia wares' of my

day in Bombay. Never haggle about prices and you will always get the best value for money in India, as well as everywhere else in the world. The ivory and wood-carvers would execute the most intricate "arabesque" designs in wood and ivory, not only without a trace of geometrical, or even mechanical planning, but seated on the floor, crumpled up on their haunches, and using their knees as the only support of the strip of ivory or wood they held with the left hand and worked with the right. They would work on like that all day, with no more thought of the geometry or the anatomy of ornament than have the bees in moulding their wonderful hexagonal cells by the rotation of their little heads. All the time I was in India I never saw a "template" or a stencil of any kind used; and I said at Mr. Hankin's lecture that I was sure he had not and he at once acknowledged that he had not. I was observant also of a great deal of house building in Bombay, nearly all of European design and under European superintendence. The only exception was a little mosque in the north-east quarter of the island, near the sea-shore, under Chinchpoo Hill. It was built by a small body of stonemasons, and from first to last not only without a draughted plan, but without measurements. I have often cited the case in opposition to my distinguished friend Sir Caspar Purdon-Clarke's contention that no one could build a house without a plan. I was officiously with these masons daily, and only occasionally would they have an aside consultation over some hitch in the construction, or some point of decoration—which was nearly all in the proportion of the construction—and then they would trace out their casual "plannings" in the dust on the ground, and with their forefingers, or I would help them with my walking-stick. I do not know how it is done—by instinct, by rote, or by divine inspiration (*i.e.* genius). I only know that the thought of "Glory to God" works wonders by the hands of these men, Hindus and Muslims, and that honest payment, as God's blessing on their work, fills them with devout gratitude and enthusiastic gratification in it.

VENTILATION OF THE HOUSE OF COMMONS.

THE following are the recommendations offered in the report of Dr. M. H. Gordon for improving the ventilation of the House of Commons:—

With regard to the Inlet at the Terrace.

There can be no doubt that the present air intake would be improved by raising the inlet a few feet and at the same time widening it. The difficulty, however, is to do this without interfering with the appearance of the building. A systematic survey of the structure of the building at this point might, perhaps, lead to the discovery of some way in which these ends could be attained without unduly interfering with the façade. If it could be done, a good plan would be to draw the air in through some opening already existing above the level of the terrace. In any case traffic over the north inlet should be abolished.

In view of Dr. Hurtley's observations, I would recommend that the fine spray at present in occasional use for moistening the air at the inlet should always be employed in the future for the purpose of purifying the air passing through the airway.

With regard to the Airway between the Terrace and the Equalising Chamber.

Owing to the fact that the fan which draws in the air from the terrace is separated from the inlet by a distance of about 100 feet of airway, and also owing to the resistance to the inflow of air offered by the comparatively small size of the present inlet, there is a great tendency for air in the basement and engine-rooms which abut on the airway in this interval to be drawn into the air-stream passing to the debating chamber. The air in the engine-rooms and basement contiguous to the airway in question is, in my experience, somewhat "stuffy;" at any rate it is undesirable that any of this engine-room air should be drawn into the airway and passed to the debating chamber. There are three wooden doors into the airway between the fan and the inlet. One of these doors gives access to the airway from the basement under the central hall, the others are situated on either side of the airway near the inlet. The door giving access from the basement under the central hall is a double one contrived on the principle of a river lock. No special means are in use to make these two doors airtight. The

other two doors, one on each side of the airway near the inlet, are also not airtight. Moreover, when the House is sitting, and a stream of fresh air is being drawn by the fan along the airway towards the debating chamber, occasionally one of these doors near the inlet is opened for the purpose of passing a policeman or perhaps a workman across the airway. Though traffic in this sense is infrequent, every time the doors open air from the basement and engine-rooms must needs be drawn into the air stream and forwarded to the debating chamber.

I am of opinion that all three of these doors should be airtight or at least should be made absolutely airtight. In any case no one, policeman or other, should be allowed to pass across the airway when the House is sitting.

If it be determined that the doors that are in question be made as airtight as possible, their imperviousness to air should, when this is believed to have been accomplished, be proved when the House is not sitting by generating hydrogen sulphide gas on that side of them in each instance without the airway, for the purpose of testing by the sense of smell whether or not the gas thus generated can find entrance within the airway. The smoke test could be used as well, but hydrogen sulphide is far the more delicate test, and therefore the more trustworthy.

The need for imperviousness of the airway between fan and inlet is increased now that the fan power is greater. On the other hand, the outward leaks located between the fan and the equalising chamber are of less importance than when the fan power was less.

With regard to the Debating Chamber.

I would recommend that shallow pans of water should be suspended in the battery chamber over the heating apparatus in order that the increased avidity for moisture that air obtains through its temperature being raised should be satisfied. The pans and water should be kept absolutely clean, and should be examined as a matter of routine every day before the ventilation is started.

Possibly wet mats suspended in the battery chamber may be found useful for moistening the air. It would also be an advantage to use warm water for moistening the air. The question of these and other details, however, can only be decided by experiment upon the spot.

After the air has been warmed and moistened, means should be taken for insuring the uniformity in these respects of all the air passed upwards into the various parts of the debating chamber.

That all steam pipes passing through the airway between the inlet and the floor of the debating chamber be covered with asbestos or suitable composition, so that these irregular sources of increased temperature should be isolated from the air as much as possible. There is a steam pipe in the cotton-wool filter under the Speaker's chair, another in the equalising chamber going to the Treasury bench, and in the battery chamber under the Government side of the debating chamber and over the Commons' pipe vault are a number of steam pipes. All of these steam pipes should be screened from the air as much as possible.

That by means of numerous hygrometers the humidity of the air and its capacity for absorbing moisture* should be observed and controlled throughout the equalising chamber, debating chamber and division lobbies as regularly and systematically as the temperature now is. It is of great importance to have a large number of hygrometers in use and to observe them frequently. Further, it is as important to prevent the air of the debating chamber becoming too damp as it is to prevent its being too dry.

That, with view to diminishing the liability of the air of the debating chamber to be polluted by material continually being brought in upon members' boots, a tray be, as a makeshift arrangement, placed beneath the grating of the centre gangway between the bar and the lobby door under the clock. This tray should be in close apposition to the grating so as to prevent particles of dirt being carried up by the air currents. An alternative plan, also makeshift, would be to place a movable metal plate over the top of the grating and under the present matting. The exact spot should be determined on by observing where the traffic at this point is most active during use of the chamber. Whatever remedy is temporarily adopted here might also be applied behind the Speaker's chair and perhaps under the side gangways.

It may be added that a considerable amount of dirt falls

through the floor of the division lobby between the entrance to the debating chamber from the Commons' lobby, and the folding door under the clock of the debating chamber.

It is necessary to insist that any arrangement such as is above indicated should be regarded as temporary only: it would necessarily operate to diminish the area of air entry. As, however, there is reason to think that in order to remedy the faults in the present distribution of the incoming air through the floor it will be necessary to increase the resistance to the up-flow of air through the gangways, it is possible that the prevention of pollution of the air from material brought in upon members' boots, and also the prevention of air-waste, may be combined in the same remedial measure. But before the exact form of that remedy can be arrived at, it is first necessary to carry out an investigation of the present distribution of the air over the floor area.

While there cannot be any doubt that so far as the gaseous products of respiration are concerned the upward system of ventilation as in use in the debating chamber at the present time is not open to objection, it is equally clear from the results of this investigation that so far as particulate contamination by material given off in the breath is concerned, the existing upward system cannot do away with it.

Several new buildings are now being supplied with downward ventilation. Unbiased and detailed evidence of the value or otherwise of this system is not available, but an investigation on lines such as I have adopted could be made, and useful, perhaps valuable, information obtained. I venture to submit that, in view of the unsatisfactory results of the present conditions at the debating chamber, some better means of dealing with the particulate contamination to which the air is continually subjected during debates is desirable, and that such better means should be sought diligently.

That the distribution of the incoming air through the floor of the debating chamber be determined in detail and that measures be taken for insuring that the air is directed equably to the parts where it is required.

I may here add that from Dr. Boswell Reid's book on ventilation, a copy of which I have only recently been able to obtain as it has long been out of print, it is quite plain that he designed the present equalising chamber of the House of Commons "that local currents, otherwise apt to form unequal eddies, might be broken and terminate in a uniform supply to every part of the floor."

Dr. Reid used hair matting on the floor of the debating chamber in order to increase the diffusion of the air passing up through perforations in the floor. The hair matting he caused to be changed daily. It is worthy of serious consideration whether this hair matting used by the designer, and evidently in his mind when he designed the present system, should not replace the present string matting. Besides increasing diffusion of the upgoing air, another advantage the hair matting has is that it permits of being sterilised by steam. The present string matting is liable to injury by steam, and therefore it is only formalinised—a disinfection process that kills some, but by no means all, micro-organisms. Steam, on the other hand, as applied in a modern steriliser, kills all micro-organisms at a single exposure. An instance of the relative value of the two processes is seen in the fact that anthrax spores escape when subjected to the action of formalin vapour,* but are killed by steam.

I would recommend that a more effectual withdrawal of air be obtained at the end of the ceiling over the Speaker's chair and ladies' gallery, and that whatever the means adopted for securing uniformity of withdrawal from the chamber, anemometer tests be made to prove its efficacy.

I would suggest that the ventilating men when on duty between the inlet and the floor of the debating chamber wear clean white linen or drill, &c., clothes or overalls, and that before coming on duty they change their boots or wear felt slippers. The latter would have the advantage of making their tread noiseless. The white clothes should, of course, be washed frequently on a routine system, and at the same time the felt slippers might be sterilised by steam.

These precautions are taken to prevent particulate pollution of the air of operation-rooms. There is no reason, therefore, why they should not be employed with the same object elsewhere.

For maintaining the uniform efficiency of the ventilation it is desirable to have a continuous record of its most important features. This is at present carried out up to a

* These two qualities of the air should not be confused. A cubic foot of air containing 75 to 76 per cent. of humidity absorbs, at 40 degs. F., .7 grain of water, but at 80 degs. F. 2.7 grains.

* Report to the London County Council on disinfection by Drs. Klein, Houston and Gordon, 1902.

certain point, but the record is not complete enough. I would strongly recommend that blank forms of charts be printed, and that on these charts should be recorded in continuous curves the temperature, the relative humidity and the evaporative power of the air in the equalising chamber, debating chamber and division lobbies respectively. The quantity of air passing into different parts of the debating chamber and out at different parts of the ceiling should also be constantly observed and recorded, and for this purpose some graduated form of static anemometer that could be fixed, for instance, on the gratings in the equalising chamber, and some form of self-recording anemometer in other parts of the air courses are needed. It is only by controlling all these features scrupulously and continuously that the desired end can be secured.

Force is added to the above suggestion from the fact that, since it was written, I have obtained the copy of Dr. Reid's book to which reference has already been made, and on page 328 he gives the elaborate printed form which was used at the House of Commons when he had charge of the ventilation. It is interesting to note that the velocity of the air was observed, as well as the temperature and other points. The scrutiny of all features of the ventilation was so elaborate that in some cases, where debates had been continued for a long period, he made, with advantage, from 50 to 100 variations in the quantity or quality of the air supplied in a single night. Dr. Reid's success in ventilating the House of Commons is beyond doubt, as the following statement of his contemporary Arnott shows:— "Until the late House of Commons existed as ventilated by Dr. Reid, there was never in the world a room in which 600 persons or more could sit for ten hours in the day, and day after day for long periods not only with perfect security to health, but with singular comfort."

Finally I venture to ask your lordship to regard these recommendations and suggestions as the outcome of an investigation which, though as detailed as I could make it in the time at my disposal, has not covered the whole ground. Although the ventilation of the debating chamber of the House of Commons has taken 250 years to reach its present stage, it could, in my opinion, be much improved even in the present building with systematic and continual study. I have merely indicated what constitute, I believe, the chief lines along which this improvement may be obtained, and the vigour, comfort and health of members advanced so far as the air of the debating chamber is concerned.

WHAT IS ART?

THE annual exhibition of the Dundee Art Society was opened in the Albert Institute by Mr. Pittendrigh Macgillivray, R.S.A., who delivered an address on the subject, "What is Art?"

Mr. Macgillivray, in the course of his address, according to the *Scotsman*, said:—I would ask you to consider most works of art, in either music, sculpture, painting or poetry, as serious human documents—efforts at the expression of things indefinable and in the only language possible to them. Serious works of art we confront, so to speak, a window into the mind of the artist and a mirror wherein to study our own soul. The old saying which defined the duty of the artist to be the holding of a mirror up to nature is not to be taken literally. We do not take the artist to be a person with a glass eye, like a photographer's camera—being, with an inhuman lack of personal prejudice and living interest, one thing to be as good as another, and nothing to be of passionate importance. It would almost seem unnecessary to say, did not the walls of every exhibition show the necessity, that a work of art is not a reproduction of any material object. Nature in art is not the vehicle, like words in language, whereby emotion expresses itself. There is, perhaps, nothing in the practice of art I, as a workman, am so much impressed by as the uselessness and fruitlessness of trying to reproduce or imitate natural forms and surfaces. It might for me almost be set down as an axiom that the nearer a statue is to the actual nature in its execution—the more a picture has of photographic accuracy and deceptive presentment—there is the further remove from a work of art. In brief, that which is realised is past and dead. Besides the presence of the unique eye and dead hand of materialism which is to be met with in the art world, there are other less obvious and more debatable factors—side issues, I deem, from the high way of art's purpose. These may be defined in painting as colour, atmosphere, design and incident, or story-telling. A, no doubt, in some indefinable way go to the making of

a great picture, but the side issue, to which I have referred, consists in this: that each factor has a body of exponents who will scarce consider the others in the making of a picture. There is, for instance, the Whistler faction, whose special shibboleth is that blessed word atmosphere. If only the picture have atmosphere and all the objects in it be within their proper envelope, much will be forgiven. The subject may be old factories and smoke stalks, yet shall they pass, in the mystery of atmosphere and the language of the master, for palaces and haunts of beauty. Granted the proper veil, the residue of the sordid and ugly becomes metamorphosed into the quality of beauty. But this metamorphosis, the master has wisely added, is for the artist only, alas! Then we have colour men. They don't mind about atmosphere; tone by balance of colour is more in their line. They see things with kaleidoscopic vision, and sometimes produce pictures in such a patchwork of colours as to be unintelligible save from the Eastern carpet point of view. Personally, I think the ideal aimed at in this case is much to be preferred when it takes the form of a Persian or Bokhara carpet. Colour without sufficient intellect of form is like sweet sounds without that measure of time which creates order and music. We find another group of artists who are fascinated by the play of lines and shapes. They overstep the balance with a love of decorative forms, and so long as these have a certain quality of rhyme and rhythm akin to music, other matters of deeper meaning, may go by default. The tendency in this direction is to become formal and ornamental—to generalise and become abstract at the expense of that individual or personal quality which is the real interest of one self in another. Lastly, we have the pictures of the incident painter or story-teller, who is so intent upon the literary aspect of his subject that the factors of artistic fitness and beauty go past him unheeded. As an artist he is something of a hybrid, and might with advantage be recommended to take the veil of atmosphere and pray to the genius of Whistler. The purpose of art is not, I think, to be a mere decorative embroidery on the hem of the garment of life. It is not the toy of an idle hour, although much done under the name might lead us to such a conclusion. The fine arts are, I believe, our highest educational forces, for they appeal to, and deal with, our spiritual being, which after all is the only element worth considering and continuing for. From this point of view no work undertaken in the neutral, mechanical manner of reflex action—no work of the artist which is not illumined by that manifestation of the spirit we call imagination—can avail. A true work of art must be the symbol and tally of a noble and ennobling state of the emotions on part of its creator. It must embody expression of his highest aspiration in the matter dealt with, and, in proportion as it is sincere, true and vital, it will move others to an equivalent condition perhaps for the first time, and so be a means of spiritual development. It should be a matter of religious faith on part of the artist-poet, painter, sculptor, or musician, that he, according to his gift, can add to the wealth of spiritual life and be strengthened and enriched himself in so doing. A great work of art may be defined as a beautiful act of worship, and of the arts in their range it may be said that they enable us to see and hear, think and feel, through sympathy, something of the subtle, indefinable things that move that whole of which each of us is but a unit. I shall hear about the foolishness of the didactic in art, and probably I shall be able to agree. I do not advocate parables in paint, or any other kind of subject matter in pictures or sculpture requiring language in explanation, nor do I sympathise with the morbid nightmares of sexual decadence which in some regions pass muster for poetry and soul in art. The right thing is clean and healthy, and tends to vigour and sweetness of life and mind—to spiritual illumination, not moral decrepitude. Again, What is art? Who shall say? Is it perhaps an effort of the spirit towards reincarnation? In some way the spending of life in the creation of art makes for the profit of self-perfection and the perpetuation of personal force, and long, long after the artist has ceased from his pain and travail—long after his body has disappeared, and the eyes and hands that saw and shaped a mystery of beauty have been lost in the general dust, the reincarnation of the best of him continues in us, to awake emotions that increase our spiritual stature. After twenty-four centuries the soul of Phidias lives, and like a vestige clings to those half-ruined symbols which survive from his hand, and with a vitality which makes of the Parthenon room in the British Museum a Mecca whereto all sculptors irresistibly tend in homage.

NOTES AND COMMENTS.

ALL the Proprietors of the London Institution are not satisfied with the prospect of amalgamation with the Society of Arts. The dissentients prefer that the property should in some way continue to be associated with the City of London. Lord AVEBURY proposes that a building or a group of buildings resembling Burlington House should be established for the members of the London Institution, the Society of Arts, the Royal Society of Literature, the Authors' Society, the Irish, Anglo-Russian, Elizabethan and other literary societies, the Harleian Society, and all similar institutions. The building could be accepted, his Lordship considers, as a memorial of WILLIAM SHAKESPEARE, whose statue might be set up in the common hall. In that case an opportunity would be presented for the erection of a building that would worthily represent the architecture of the twentieth century.

LOCAL authorities seem to be desirous to erect cottages for the working classes instead of large blocks of model dwellings. If they all resemble the Guildford Town Council, architects are not likely to become millionaires by the premiums which are offered. The Council are desirous of erecting twenty-four or twenty-five cottages, each having three rooms upstairs, a large living-room and scullery. For the best set of plans, specification and estimate a sum of 20*l.* is to be awarded. The Corporation do not bind themselves to engage the successful architect, but if he is engaged to supervise the work the 20*l.* will be considered as part payment of his charges. But if the architect's estimate is exceeded by more than 5 per cent. in the tenders, the premium will not be paid. The offer seemed to be so munificent there was a long debate before it could be decided what architects were to have the chance of participating in the reward. One member wished that the competition should be unrestricted. The Mayor considered it should be confined to local architects. Another member generously proposed the competition should be open to architects living within a radius of thirty miles. Eventually it was decided to give the Guildford architects the monopoly. As the chairman of the committee anticipates that the new cottages will not increase the architectural beauty of the town, we suppose architects in other parts of England will not envy their brethren in Guildford.

THE late Mr. GEORGE HENDERSON, who died on Friday last, was an architect whose practice was important, although, like representatives of the old school, his name was unknown to the majority of people. He was a son of Mr. JOHN HENDERSON, who was also an architect. He began practice in Australia. On his return to Scotland he entered into partnership with Mr. HAY. Among the works with which he was associated were, according to the *Scotsman*, the restoration of St. Giles's Cathedral, St. Mary's Cathedral, Old Coats House, Trinity College, Glenalmond; Hirsell and Douglas Castle, additions to Bowland House, additions to Colliston Castle. For Dr. WILLIAM CHAMBERS he restored the tower of the ancient church of St. Andrew at Peebles. At Galashiels he built St. Paul's parish church and the free library. The parish church at Distington, in Cumberland, with the schools adjoining, was also his work. Under his care the nave of the beautiful St. Mary's Church, Haddington, was restored. The parish church of Craiglockhart, near Edinburgh was his work, along with the tower added to it by Sir OLIVER RIDDELL. Mr. HENDERSON was also employed for buildings of importance in Canada and other colonies. The cathedral at Bermuda, in the West Indies, now nearly finished, was designed and built by him, as was also the residence of the Governor of that colony. At the time of his death Mr. HENDERSON had just completed the extension of the nave, with the

addition of a side chapel, to the interesting building of St. Paul's Episcopal Church, Carrubber's Close, Edinburgh. He was also engaged in the restoration of the ancient parish church of Corstorphine.

OLD FARM-BUILDINGS AT SAINT-GERMAIN DE LIVET, CALVADOS.

IN the valley of the Touques, some miles from Lisieux, lies an old moated manor-house, and near it the farm-buildings shown in Mr. HAIG's sketch. The mansion is in the form of a quadrangle, three sides of which, with their round corner towers, date apparently from the sixteenth century, and the fourth, a plain late Gothic building, from the fifteenth. The later Renaissance part of the work is, as to its lower portion, faced with alternate light and dark squares, like a chessboard, the light squares stone and the dark brick, with a greenish glaze; and as to its upper part, stone, enriched with small niches and delicate mouldings, and sparsely pierced with square-headed windows. The gateway is of rather good sixteenth-century work, and the courtyard, arcaded on one side, is partly and rather flimsily restored. The older portion of the building is of stone, and buttressed as to its lower and half-timbered as to its upper part, and from the outside more picturesque than the Renaissance portion. The water of the moat of course adds a great charm to this old *manoir*, as it does to similar structures in England. The farm-buildings are separated from the house by the moat, and present a pleasant picture seen from the little wooden bridge with the water in the foreground.

CATHEDRAL OF OVIEDO, SPAIN.

THE rebuilding of this cathedral was commenced in 1301 with the chapter-house (east side of present cloister). In 1345 an impulse was given to the completion of the cloisters by a visit from ALFONSO XI. The church was begun in the episcopate of Bishop GUTIERREZ DE TOLEDO (1376-89), continued through the fifteenth century, and brought to completion in the time of CRISTOBAL DE ROJAS (1546-56). The spire was added in 1575. The south tower is the open porch of the south aisle. It has a large turret at the south-east angle and large double buttresses at the others. Traceried windows surmounted by ogee-crocketed and finialled labels occupy the three stages above the great lower arches, and a boldly projected gallery with openwork parapet terminates the tower proper. The next stage is somewhat smaller than that below the gallery. Each of the circular turrets at the angles has a spirelet. There are a couple of crocketed pinnacles on each side between the turrets. Another openwork parapet crowns this midway stage—part tower, part spire—and makes the transition easy to the openwork spire, octagonal on plan, crocketed at the angles, which reaches the total height of 269 feet (English). From the south the outlines and the not too elaborate piercings of the rich yellow sandstone spire are well defined by the intensely blue sky, the great mass of the Sierra-de-Naranco forming the background to church and tower. Altogether this is one of the best of the pierced spires. The relative heights of tower and spire, the moderate length of the pierced octagon, the transition from the square through an intermediate stage of mixed outlines, the proportion of the tower buttresses and of the pinnacles terminating near the top of the intermediate stage, all seem incapable of improvement. A thorough simplicity is made to result from complexity of idea and detail. The fullest value is given to the height of the tower by the square form being so long continued and so emphatically crowned.

THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. E. Dawber, president, in the chair.

On the motion of the President, a vote of condolence sympathy with the family of the late Mr. C. B. Arding passed. Mr. Arding was the oldest member of the Association, having joined in 1848. A second vote of condolence was passed to the family of the late Mr. H. D. Grey.

House List, 1905-6.

The following gentlemen have been nominated for election April 7 to hold office during the next session:—

President—Mr. E. Guy Dawber. Vice-presidents (two elected)—Messrs. J. Murray, Louis Ambler and Peter Cave.

Committee (ten to be elected)—Messrs. R. S. Balfour, J. Clapham, H. Gregory Collins, Alfred Cox, J. B. Fulton, Theodore Fyfe, J. S. Gibson, H. T. Hare, R. P. Jones, Keen, F. Lishman, Geoffrey Lucas, A. Mitchell, H. Moore, W. A. Pite, E. A. Rickards, J. MacLaren Ross, Tatchell, M. E. Webb, R. Douglas Wells and A. J. Wilson.

Hon. Treasurer—Mr. F. Hooper.

Hon. Librarian—Mr. W. A. S. Pettit.

Hon. Secretaries—Messrs. H. Tanner, jun., and A. Lyon Watson.

Hon. Assistant Librarians—Messrs. Edwin Gunn and J. Crickmer.

Sketch Plans and Working Drawings.

Mr. A. NEEDHAM WILSON read the following paper. He

was asking an architect to read a paper on such a subject. It is I venture to think a mistake has been made. The subject should have been dealt with in two separate papers, one from the point of view of the person most interested—“Sketch Plans, by a Client,” and “Working Drawings, by a Designer”—then I think we could have looked forward to a very interesting evening, for I take it that our committee has no intention of arranging for a dissertation on the history and development of draughtsmanship—which has been frequently done—but wished to consider the subject generally. Personally, I hardly think an architect best qualified to lay such a subject before architects, and any attempt at criticism would be altogether beside the mark. Though general broad rules govern our procedure in these matters, there is happily so much individuality shown by practising architects that no one with the smallest sense of decency can well say, “So and so is the right way to prepare working drawings, and such and such is the wrong way.” In an open meeting like this, too, it would be impossible to lay down rules for the guidance of students who are probably being taught better ones elsewhere—rules, which might be contradictory and only lead to confusion. Given a proper basis upon which to work, I hold it is better to allow every student to develop along the lines of his individual fancy rather than he should be hampered by stereotyped methods or cut-and-dried ideas. I think that this wise latitude is being reflected in what we may term the “broad-mindedness” which I think I can find in our architecture of to-day.

Therefore I shall only attempt to deal with my subject in broad lines, and if I talk round it a little bit and utter a few well-worn platitudes, at least I shall hope to avoid being dogmatic.

The practice of architecture involves many trials, many anxieties and many anxieties; but one of its compensations is in the preparation of sketch plans, and, perhaps to a lesser degree, working drawings. And yet even these are their drawbacks. When those first enthusiastic conceptions so brilliantly drawn come back to us mutilated and recognition, and we are bidden to carry out the thing from the poor remains, then we feel this is a sorry world.

If we could not clothe the dry bones of commonplace ideas—other people's ideas and not ours—with some architectural flesh in the working drawings, we should find but little comfort in the bald satisfaction of a client.

It is astonishing how great a sense of gratification may be derived from a good drawing. The dulllest routine work becomes interesting. Even a detail of a rivetted girder can be made attractive in skilful hands. And we can redeem what is dull and monotonous in our labour by the noble pride evidenced in the attempt to do adequate

justice to the architecture by the drawing. That is how I look at it. How the client looks at it is another matter, but how the builder looks at it I soon find out, if my enthusiasm has led me astray from the path of working-drawing veracity.

The consideration of the means by which an architect translates his ideas and conceptions into hard matter-of-fact bricks and mortar must always be of interest to architects if not to anyone else. Working drawings scarcely appeal to the man in the street. He can only judge the architect by his works as evidenced by actual buildings, and too often any appreciation is limited to their utility. Should such utility fit in with the usage of the man in the street he rarely casts a thought to the process by which the building was evolved—scarcely to the building itself. To him it is sufficient that it is there, it grew spontaneously, or developed under the hands of the builder by some intuitive perception of the requirements of the man in the street.

If he be a particularly well-informed man, he will know that some architect has been employed, and if he casts a thought to him at all it will be only to revile him. Occasionally the man dabbles in building, and becoming daring, talks to his nearest friend in an airy way about employing an architect, and in the tone that he would of a strange order of beings of whom he has heard but with whom he has never come in contact. The friend is impressed, but warns the man that he has heard that architects demand 5 per cent. for doing nothing at all, and he, becoming alarmed, straightway goes to a builder. How many outside our profession have the smallest conception of the process which must be gone through to enable the architect to erect his building? Even those who are best informed have an idea that an architect does nothing more than spend a pleasant hour or two occasionally in toying with a pencil and colours and producing pretty sketch plans which, when approved, are handed over to the clever builder, who turns the thing into a structural success. The ring of the trowel, the hammer's thud, the crisp sound of sawing are realities to him, something tangible, whereas the means by which the architect achieves his end are a silent, unseen force and therefore unknown. He neither knows nor appreciates the concentration of thought, the focussing of years of hard work or arduous training that may be incorporated in the dashing sketch, the few clever lines or splashes of colour which show him his building as it is to be, or rather as the architect thinks it ought to be, furnished with ideal surroundings which do not exist and never will exist. It never strikes him that those slight sketch plans, in which everything is so perfectly arranged, are the result of much anxious thought and expenditure of midnight oil. He never dreams that the ingenious arrangements which fit together so well are integral parts of a harmonious whole, and probably indulges in some cheeseparing economies which upset the balance of the architect's scheme. It is nothing to him that those features he wipes out so light-heartedly have cost hours of patient labour and thought, and that the architect must again draw together his scheme and endeavour to cast over the mutilated remains the glamour of his individuality. If this be so of the sketch plans, which he necessarily must see, what of the working drawings which he only sees when he signs the contract? I am not grumbling, or even speaking with a sense of bitterness, unless it be against the idea that we earn our money too easily. The preparation of preliminary sketches is its own compensation, and no architect worth the name begrudges the time or labour expended in expressing his ideal of the problem immediately before him, and reaps his reward in endeavouring to do it justice with pencil and colour. According to his success in translating it into matter-of-fact building materials is that reward increased, and his delight at success cannot be measured by pounds, shillings and pence. Other people, even his professional brethren, may consider his effort a blot on the fair face of the earth, something to frighten intractable children with, but to him it remains a thing of joy until he becomes discontented with it by doing something better. He is an artist for art's sake; he wishes to express the beautiful, and cannot be bound by sordid considerations of 5 per cent. The painter expresses his conceptions with his pigments and brushes on his canvas in the best manner he can according to his artistic capabilities, and the architect similarly expresses his, but with different materials, each being actuated by the love of the beautiful. The one has completed his work, and appeals to a wide circle of admirers or critics. The other has not completed his work, and has appealed to an infinitely narrower circle, and must go through the procedure of working

drawings, specification, quantities, details, superintendence and settlement of accounts (to say nothing of "extras") before he can appeal to the public. The work of the painter enlists the sympathies of the public far more than the work of the architect, and the same public would little appreciate the artistic merits of a set of drawings, even if "sketch plans." The expression of the painter's ideal on canvas is fostered to a large degree. The expression of the architect's ideal upon paper is relegated to a little back room at the Royal Academy, probably to provide a secluded nook from the "madding crowd." The public will pay a shilling to see the painter's work, but they would not flock to see the architect's work, even if they were admitted free. And yet the architect plods on, taking his delight in his obscure "sketch plans," and sends his dashing sketch to his client, not wholly actuated by sordid motives in so doing, but anxious to express his ideal in as favourable a manner as he can for the very love of it.

What if he does idealise over much? What if he frames his building (on paper) in an imaginary setting? What if the skilfully blotted-in mass of redundant foliage only exists on paper, and the lovely formal garden with yew hedges will yield to serpentine walks and a tennis lawn? That is the fault of the client who chose the site, not of the architect who designed the building; and if the client is eventually disappointed because the actual structure looks so different from the clever sketch, well, it cannot be helped. The setting ought to have been there, that's all, and the architect has extracted a considerable amount of compensatory pleasure from his sketch, which he forthwith sends to the Royal Academy. I am afraid these sketches and sketch plans have a great deal to answer for.

I have even known them induce a client to spend more money than he originally intended. Unless this is artfully worked it leads to trouble, I believe. The client says to his friends, "Most expensive man, that architect fellow; made me spend far more than I wanted." Still, I am told it is surprising how a client may be led on by a judicious succession of sketch plans.

On the other hand, I am informed that "sketch plans" may lead a client to expect something that he does not get. Then he is dissatisfied and feels defrauded. Also, I gather that sketch plans occasionally lead to costly estimates and the abandonment of the work. Then the would-be client declines to pay for them, and the architect has to decide between a lawsuit and endeavouring to live on what pleasure he can extract from making beautiful drawings. This is what I am told, but I do not believe it. Indeed, I see sometimes from the papers that clients like the plans so much that they insist on keeping them. Some, indeed, claim a legal right to do so. Why, when they buy a picture, do they not claim the painter's colours and brushes? They are but the painter's tools, the means to an end, as are the architect's drawings. As the opposite to the man with a passion for architects' plans, commend me to the man who does without plans, and who employs a builder to erect a *potpourri* of details sneaked from other buildings, and who pats himself on the back in appreciation of his cleverness in saving architect's fees.

The great advance that has been made in water-colour work is not the least striking sign of development in our profession. I can well remember the time when the power to turn out a water-colour sketch of real merit was in the hands of a few men of conspicuous ability. Other men who wanted that sort of work went to specialists. There were more men certainly who could produce able work in pen and ink, but the vast majority produced sketches which now strike us with amazement.

To-day, every man almost can handle a brush, and more often than not in a most creditable way, and the number of those who produce work of really artistic merit is largely on the increase. To this desirable end I think our Association has contributed to a marked degree, and recently I have been greatly struck by the manner in which a large number of our students have represented their designs, many of the sketches being of great merit, and, indeed, much better than the architecture. It used to be a complaint that the drawings on the walls at the Royal Academy were the work of specialists employed to give fictitious merit to the designs. The fictitious merit may still be there, but at least it is now most usually the work of the designers themselves. Personally, I am not one of those who think working drawings and details should cover the walls at the Royal Academy.

I think the buildings should be represented as they will appear when executed. Working drawings appeal only to

he limited circle of the profession itself, whereas we ought to enlist the sympathy of an infinitely wider circle, not a sordid point of view, but from an educational one.

As it is, the tasteful work exhibited attracts the public not at all, for as yet we have not succeeded in creating more than a languid interest in our work which, apart from our professional brethren, is only seen by our dutiful admiring friends and the man who thinks he is swindled of his shilling's worth unless he examines every picture in the place. Some years ago the editor of a leading professional journal asked the question of many of our laymen "why the exhibit attracted so little interest?" One of the published answers was, "Because there are so few good architects." I do not think so at all. The fault lies with the public, if it lies anywhere, and the necessity of placing our work before it as attractively as possible is bringing its own remedy.

It is natural, too, that the average client should want to see how his building will look when completed, from an actual point of view and in its actual surroundings. He should not be expected to transform himself into a spirit for the time being, or to view the building from the upper floor of an adjoining building. Elevations may be nearness to him, however ably coloured.

I wonder how many architects take the trouble to sketch the actual setting for their building—so essential to the ultimate effect, but surely so very necessary to a harmonious whole? How often do we see a house which would be delightful if embowered in trees, but which looks distressed in the nakedness of a bare field?

I am only pleading for a little more honesty in sketch plans, which, I take it, include the very necessary "perspective view."

An architect is apt perhaps to represent his design under the most favourable conditions. He conceives it possible to show it to advantage in a blaze of sunshine to show it to advantage. But in this country we do not live under such weather conditions, and the conception may suffer materially when beheld under a grey sky and pouring rain. I do not suggest that he should present it before his client under such conditions. The result might have a damping effect, but I do suggest that the architect should consider such effect on his design. These observations may be commonplace and trite to my more experienced brethren, but I would commend them to my younger fellow students as suggestions worth some consideration.

May I offer another hint?—which is this. Instead of preparing a fictitious perspective from the drawings, why should the architect not make an actual sketch—in whatever medium he prefers—from his executed building? A faithful drawing, without exaggeration, with all the blemishes strictly reproduced, and send that for exhibition or publication, as the case may be. You may say, Why not a photograph at once? I do not think so. It would not teach nearly so much of the defects in his work, and he would lose all the pleasure to be obtained from such a sketch.

It will scarcely be denied that the art of the draughtsman has made enormous progress during the last twenty years or so. I was educated in an office where the traditions of the old "hair line" still lingered, and I can well remember the feelings of awe with which I contemplated the daring departures made by the leaders of the new school of draughtsmanship. The old method was suited to the architecture—very correct, but singularly tame and unattractive. Now, the poorest architecture can be made attractive—on paper—and the disappointment must be the keener when the executed building comes to be displayed to public gaze. There will be few who will detect that a great advance has taken place in our architecture. Buildings of striking merit and individuality are springing up on every hand, and such violent oscillations as the Gothic Revival and the New Art have brought their inevitable reaction. Personally, I feel that the advance in draughtsmanship has somewhat outstripped the advance in our architecture, and the rather coarse and dashing methods are apt to be reflected in the ultimate buildings. This has been forced upon my notice somewhat strongly of late in examining the work of our students, and I think I can detect a decided tendency to slur over the study of detail. Careful consideration of parts is sacrificed to effect in the drawing, and the architecture is subordinated to a prettily coloured sketch. I admit that this fault chiefly occurs in the cleverer or more brilliant designs, and that the sober efforts are often distinguished by tamer methods. But I do suggest that there is a source of danger in the cult of the new draughtsmanship which, if pushed to extremes, may

disastrous effects. The application to actual practice possibly be a restraining influence. An architect really wishes to exhibit his conception in the most effective form to his client, and, moreover, his sketches are his idea of the appearance of the finished building and everyone will agree that, so far, considerable latitude is not only legitimate but laudable.

But what shall be said when these methods are applied to working drawings—when the traditional manner of engravish materials gives place to artistic colouring, and ink lines leave a considerable margin for conjecture on the part of the quantity surveyor or builder?

Only recently I heard of an instance where the skilful draughtsman who prepared certain drawings contrived to tint some work so that the unlucky surveyor confidently took it for a finished drawing. And anyone who has seen a disconsolate foreman trying to scale with a 2-foot rule from an $\frac{1}{8}$ -inch plan prepared by a modern draughtsman will readily understand that the architect must not be too particular to 3 inches or 3 lines. The moral is that the methods which are legitimate in sketch plans require modification in the working drawings—no difficult matter in these days of sun prints. Probably the process by which careful and accurate working drawings are made from the sketch plans commends itself to the draughtsman, and better preserves the spirit of the original conception than a translation into a series of carefully worked pencil drawings prior to such tracing. I think it will be generally agreed that a surprising loss of original freshness of spirit may occur when the first conception is filtered through a number of drawings.

As I have said, in such a paper as this any attempt to lay down rules for others would savour of impertinence. Criticism would be out of place. Each man must necessarily use the means which he finds best suited to his purpose, and the mere observer who is ordered to comment on a paper on such a subject by an implacable critic can only comment; for between the man who sketches the building with the slightest material in the way of working drawings and the man who furnishes the building with elaborate and fully figured and written-up drawings such a wide field of experience and custom works towards the same end that any attempt to harmonise the two would be futile. The one man expects his builder to take into his mind and identify himself with the thoughts which the drawings are only the expression—maybe an inadequate expression. Neither the builder nor the builder's draughtsman have been trained to this, and the question of success largely depends upon how the architect can imbue them with his individuality, how fire them with his enthusiasm, how stamp his work with that indefinable something which cannot be expressed on paper. The other man, practical to the very ends, finds himself in conflict with a building draughtsman and workmen trained in technical schools, and, in the honest attempt to combine art and practice, succeeds in imparting a certain hardness to his work which he finds unpleasing and which he cannot understand.

Do not suppose there can be two opinions as to which of the two methods we should prefer; but, unhappily, we train our workmen differently, and something of the old craftsmanship methods can be recovered, we are suffering under great disadvantages. It seems to me that the forces are operating at the moment—an artistic force and a technical force—and that they are operating on conflicting lines. Nor do I know that we are doing much to harmonise those forces. I think we should as a body have a larger say in the training of our workmen and turn our effort for technical instruction in the right direction. The constructional methods born of the technical schools, creeping into use, mainly, I think, where the architect has such points in his artistic working drawings; and finally, though desiring to be progressive, I have grave doubts whether these new methods are improvements on the old, and I am sure the actual workmanship is inferior. Not many draughtsmen seem to fear that they will lose beauty and interest of the design if the working drawings are elaborated? In detailing, no time is begrudged to the strictly architectural part; but too often, I suggest, the constructional niceties are left to the imagination. It is a slip, perhaps, to imply that the little tricky methods and mannerisms which lend spice to a drawing should be abandoned, but are not many of them meretricious and meaningless and confusing to the builder?

It is a sore temptation to give to one's working drawings the deft touches which suggest that the hand of Time has already dealt kindly with the building as yet on paper. Then, when it comes to be erected, the designer is

disappointed at its stiffness and lack of interest. There must be some fault in the design that has to depend upon an appearance of premature old age for its beauty, and now, forsooth, we have architects who go to the length of applying these tricky methods to the actual building. The "cocked up" apex of a gable, caused by the sagging of weak timbers, certainly adds piquancy to an old building, and one is tempted to exaggerate the tilt of a double tile verge on a drawing to soften the stiffness of straight lines, but the deliberate imitation of such effects by false construction appears to me to be bad in principle.

I know an unfinished house at this moment where the architect has not only suggested that his ridges have dropped a foot below the gables, but he has by artificial means given a wavy line to the main ridge, and a sagged appearance generally to portions of the roof. He might have built his walls out of plumb while he was about it, laid his floors out of level and thrown in a few settlements. What is the effect? That of an interesting bit of architecture, with all the glamour of age to soften its angularities? Not at all. It suggests an ordinary bit of modern work, with an extremely ill-constructed roof. I only trust it may be condemned as a dangerous structure by the local surveyor. To my mind, such methods are a dragging of architecture in the mire, and totally unworthy of the high ideals we ought to sustain. But are they not the logical outcome of the new draughtsmanship, pushed to extremes?

I am not advocating in any sense a return to the old methods. I do not desire for a moment to return to the days of "hair lines" and stock colours of distressing rawness to indicate materials. I only advocate the keeping of the great development in draughtsmanship within legitimate limits without the aid of false and tricky methods.

The architect pictures his building in his mind. He conceives the effect which he wishes to produce, and conjures up a vision, sometimes vividly clear, sometimes vague and shadowy, and in his sketch plans his endeavour is to realise that vision. To do so any means almost are justifiable. He wants to judge of the effect of his windows in the balance of parts, and "patches" them in, and having secured the desired arrangement he adjusts them to his plan and modifies their appearance according to the manner in which they are glazed. He wants to see the effect of shadows and projections, and scheme of colour, and to see it in its perspective aspect. He wants to set it in its surroundings and blend it with them, and the nearer he can hit off the ultimate appearance of his building the better for him and for his client. But should he produce something which cannot be realised through the medium of the working drawings, and cannot be faithfully reproduced in the finished building, something is at fault—either his power of realising his vision or the means by which he does so. As I have tried to show, each man's individuality is necessarily reflected in his methods of draughtsmanship.

The "picturesque" man will draw picturesquely. The cast-iron man will produce cast-iron drawings. The academic school will proceed by academic methods, as we see exemplified by our French brethren.

Happily we are bound by no traditions. Each man roams "fancy free" over his paper, so to speak, and strikes out a vigorous line of his own, and as a result I venture to think we are producing domestic and ecclesiastical work second to none in the world in its variety and robustness, the first in its adaptability to the home life of our nation and the character of our country, and the second to the requirements of our religious life.

We fail, I think, in the one thing wherein academic methods would be advantageous—in our public buildings, to which we apply too often the "prettinesses" more appropriate to our domestic work. We are not an "official" race, and we cannot think officially or stamp our public buildings with an official character. Our railway stations are a disgrace to a civilised nation, and like too many edifices allotted to the public use, frankly utilitarian. Our French friends beat us handsomely with their official work, and, despite their academic training, without slavish adherence to Classic prototypes.

We have not much to learn from them in the way of draughtsmanship unless it be the scrupulous care with which their drawings are prepared. We might certainly gain something by an examination of their studies for carving. I well remember being shown some full-size working drawings for stone capitals by the late M. Henri Révoil, executed with the brush on dark-toned paper, the high lights being touched in a white medium, and which for brilliance of execution beat anything I have ever seen.

On the other hand, he was pleased to bestow unstinted praise upon my poor little pencil efforts, which, he said, were so unlike the methods obtaining in his country. Please forgive the personal allusion in this incident, but it is the only case I can produce to show the effect of our methods upon our French friends.

It is only my own opinion, but I must say I feel our American brethren are considerably ahead of us in matters of draughtsmanship, in spite of their French training, and they have struck out on vigorous lines characteristic of their nation.

I have looked through some of the illustrated catalogues of their recent architectural exhibitions, and I confess to a little feeling of chagrin that our representatives make a comparatively poor show in matters of draughtsmanship. I may be wrong, and probably am, and you must please take my opinion for what it is worth. But if we are behind at all it will not be for long, for, having decided to change our conservative methods, we develop rapidly. Only let us beware that we do not rush into the opposite extreme. We want to breed architects, not draughtsmen merely, and must not neglect the study of our art for the sake of the drawing of it, for, after all, the drawings are only a means to an end.

I have seen many a working drawing most beautifully executed, exquisitely coloured, and I have envied the man who could produce such delightful architecture. It was not until I saw the actual executed work that I realised there was a something lacking. I could not tell why the executed work should not look as well as it did in the drawing. I have compared such drawings with the executed work line for line, and could only come to the conclusion that the clever draughtsman had cast a false glamour over the design, which disappeared when materialised.

I wonder how many architects feel as contented with the executed work as with its delineation on paper; and yet, after all, the former is the ultimate goal, conceived in the mind, and its concrete form should satisfy that conception, and not accord with the means by which it is brought to fruition.

Have not the exigencies of competition drawings largely led to this "falsification?" The temptation to attract the interest of the assessor by meretricious means is but natural. A design, meritorious in itself, sinks into insignificance in the company of others more cleverly manipulated, and delicacy of draughtsmanship is altogether killed by the bolder methods. This leads not only to competitive designing, but to competitive draughtsmanship also, and I suggest that its dangers, not only to architecture but to ordinary practice, are already apparent, and that the present generation of students are too apt to consider mere telling draughtsmanship the be-all and end-all of an architect's career.

I do not mean to deprecate for a moment the loving care and deep interest which any architect worthy of the name should put into his drawings. Any such man will always find himself wrapped up heart and soul in his drawings, and the mere worthy rendering of the most commonplace construction will be a source of interest simply for the love of the work.

I only ask that we may be judged by our materialised work—a living, vitalised, educational force—rather than that we should appeal to the senses by the imperfect and traditional means by which we achieve our ends.

There would be an immense field before the man who could invent a method for registering our thoughts as the camera will register the desired view. It would save much distasteful routine work. We do not know what the science of the future may have in store for us, but it is to be hoped no savant will devise means for thinking a building into existence, for then we should lose much that delights and compensates in our sketch plans and working drawings.

I must not conclude these imperfect remarks without offering my heartiest thanks to those gentlemen who have so kindly lent drawings, I will not say to illustrate my paper, but to give an object lesson to those who hope to follow in their footsteps. It must be of great interest to us all to see the methods of other men, especially men whose work we admire, and I feel sure an intelligent examination of these drawings will point a lesson to our students present in a way that no remarks of mine on such a subject can ever hope to do.

Mr. W. MILLARD, in proposing a vote of thanks to the author of the paper, said they had been told to treat the subject in a broad-minded way and not to be dogmatic. Personally he should wish to narrow the subject for the

benefit of junior members of the profession, and more particularly on one point. He should like to narrow it to those who were doing little exercises called designs—descriptions of imaginary buildings on imaginary sites according to imaginary conditions. He wished to know what happened to the junior students when they came to the real thing, the making of working drawings. It was then that the untrained man ran up against such difficulties as brick walls, and wanted to know how thick they should be and the height. It was no use said the speaker being broad-minded because the questions had to be settled. At such time a student was generally at sea about the sizes of things, the floors and sections of steelwork and other details exposed the profundity of his ignorance. It was therefore necessary to clear away that ignorance before he could be of use either to himself or any one else. Engineers held the opinion that working drawings were meant to work from and that men who were always in the office could not produce drawings that could be used in that way. They should be drawings that a quantity surveyor could read, and also the builder's foreman in order to work safely by them. To attain such efficiency involved knowledge and understanding—the ability to apply knowledge—and it involved decision. The man who had acquired those qualities would not stop to consider about the style or the beauty of his drawing. His standard of measurement would be, Is it workmanlike? Is it fit for its purpose? Working drawings in themselves were the indispensable means of producing their building work—the means to the end. They might be the inefficient means, and therefore suggested that the training of students should be to enable them to acquire a higher capacity for producing working drawings, for until they could do so they would never be of real use to architects, still less were they likely to become architects.

Mr. WALTER CAVE, who seconded the motion, said that paper perhaps attached too much importance to sketching. In addressing students it was well to try to teach them to complete their working drawings. The perspective sketch was of no value except to the architect. The remark in a paper that a sketch of the site should be made before a building was erected was a suggestive one, because the actual setting to a building was too often omitted, and careful sketching of the site would help the architect to proportion his work. With students' drawings they often found that details were suggested but not shown, and when the foreman or builder tried to work from them delay was caused owing to the omissions, and whereas a more complete drawing would have involved more time at the commencement, yet perhaps five minutes more work on the drawings would have saved hours to the architect and the builder in the end. It was well to be told that they were architects and not draughtsmen, but at the same time they must remember that architecture nowadays could not be produced without draughtsmen. There were so very few intelligent workmen that nothing could be left to them. Details had to be made clear, and the architect had to teach the workman in matters of taste, and if the impression could be conveyed by good drawing the workman would improve and architecture would advance.

Mr. A. MITCHELL said there was one point in the paper he would allude to, and that was the importance in the preparation of working drawings of giving all the information that it was possible to give and in the simplest way, so that the drawing could be easily read by the builder. They must regard the builder as a duffer in the reading of drawings, so that the draughtsmen should do all they possibly could to make their work clear. Small sheets were an advantage both to the builder and the quantity surveyor. The drawings, too, should be figured throughout, as innumerable troubles were avoided by it.

Mr. A. KEEN said the great danger of sketch drawing was that the architect often deceived himself as well as the client by them. Before a sketch was made everything should have been considered very fully, and though the sketch should embody the whole building, yet it should omit details which were not essential at the moment, but still show that the architect had realised the building for himself. Working drawings to be sufficient must leave room for questioning at all. Students as a rule would not carry their drawings far enough, allowing the builder to settle details for himself.

Mr. J. MURRAY said that in working or sketch drawing accuracy was all important. If they could remember that drawings and sketches were their thoughts depicted on paper the drawings when finished would be more satisfactory. There was the question of scale and proportion

and no sketch or drawing could be successful unless both had been considered. In colour sketches he felt that they should as far as possible show the colour of the materials.

Mr. H. P. G. MAULE suggested that with regard to the student engaged on working drawings, the one question he must put to himself was, Would the foreman or workman interpret his ideas? and if the student had that question constantly before him he would get face to face with actualities, and the drawing would become a working drawing in its true sense.

The PRESIDENT, who was in accord with the discussion, said it was seldom that an architect could design a building at the start and not alter details as the work progressed. Such alterations did not mean additional expense nor would they delay the work. It therefore seemed to him that the system of carrying drawings through from the start was open to question.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, March 23, Mr. Percy S. Worthington, of Manchester, read a paper on "Past Tradition and Modern Design." The President, Mr. G. B. Bulmer, was in the chair.

The lecturer said:—When your honorary secretary conveyed the honour of an invitation to read a paper before you, it occurred to me that, as you already had a number of historical papers on your list, and as I had myself some years ago inflicted upon you something archaeological, you might care to discuss some phase of the educational problem, and that of the relationship of theoretical study to actual practice in design might be interesting. I sent you a title from Norway, far enough away, you would think, from architectural microbes, and set about writing as soon as possible, and have spent the time since in periodical fits of desperation as paper after paper, and article after article, have appeared in the professional papers dealing with the same subject that I had, in my innocence, chosen. Why should men's minds all go working in the same direction without any apparent reason? It must be microbes. The taking stock of the architectural position of to-day, the difference readily occurs to us between the conscious effort after design and the arbitrary choice of styles: in other words, individualism as opposed to national co-operation in design. We acknowledge how much is owed to tradition in the past, and ask ourselves how we may make the best use of our inheritance. We have heard a great deal lately about national degeneration, both mentally and physically, and one of the remedies most generally suggested is education. In our professional education we are certainly behind that of some other countries. Theoretically our haphazard system (or want of it) should be fatal to any excellence of the art. Practically, I don't think we are in such a bad way. In fact, one is inclined to think that the work now being done is equal to, if not better than, the average work of any other country, France perhaps excepted. The student or apprentice of the fifteenth, sixteenth and seventeenth centuries was trained in the three arts of sculpture, painting and architecture, and in after years practised all three. Buildings were books then as now, and their measurement formed the self-education of the architect, whether he did it as Peruzzi did, with an eye to the composition of his architectural backgrounds, or as Brunelleschi, with the definite idea of constructing his dome at Florence. With us in England it is different, but we can hardly afford to ignore their experience, and we may take it as an axiom that for the intelligent study and practice of design a knowledge of the history and architecture of past times generally is essential. Taste may be acquired to a degree by education and experiment without being inborn, and they are within the reach of all. As an example of saving experiments with antiquity, one may cite that fine and distinguished work, the new Westminster Cathedral. With regard to planning, certain types of plans are still more or less traditional, that, for instance, of places of public worship, though even here one sees no reason why the modern type might not be evolved which might appeal to religious instincts as much as old.

The following were elected officers for the ensuing session:—President, G. B. Bulmer; vice-presidents, H. S. Morley and R. A. Smithson; hon. secretary, R. P. Lesby; hon. treasurer, W. H. Thorp; hon. librarian, F. Bowman; council, Messrs. R. Marshall, F. Musto, J. Hill, H. A. Chapman, P. Robinson, G. E. Reason.

THE SCOTTISH NATIONAL GALLERY.

A MEMORIAL has been addressed to the Secretary for Scotland by several citizens of Edinburgh who are opposed to the removal of the National Gallery to Calton Hill:—

That your petitioners are amongst the number of those who greatly value the privilege of having within the National Gallery in the city of Edinburgh a valuable collection of artistic work at all reasonable times open to the public.

That your petitioners are aware that it has been proposed to remove that collection from its present situation, and they understand that the opinion of the public has been invited on the question of the most suitable site. Your petitioners also learn that one suggestion has been to remove the pictures to the High School as a suitable place for them, and that another suggestion has been to erect for their accommodation an entirely new building on the top of the Calton Hill.

Without arrogating to themselves the right to speak for the public at large, your petitioners have reason to believe that a considerable section of the community agree with them in thinking that neither the High School nor the top of the Calton Hill are suitable situations for the National Gallery; and further, that the present situation is probably the best that can be found in the city for a public collection of works of art. The following are some of their reasons for arriving at this conclusion:—

Your petitioners respectfully submit that in selecting a site for a public exhibition of any kind there are two considerations of the first importance. It should be easily accessible and it should be central. Now it humbly appears to your petitioners that the High School is not central, and that the top of the Calton Hill is neither central nor easily accessible. To remove the gallery to either of these sites would practically close its doors to the man in the street with an interest in art and a half-hour to spare; to the visitor to the city, who has much to crowd into his holiday before he leaves for home, and even to some extent the leisured class, who during many days in the year could not find their way to the Calton Hill without being exposed to wind and rain.

Your petitioners submit that either of the handsome structures on the Mound is better suited for a public gallery than either of the sites above referred to. The Mound buildings stand in the very centre of the city. From the North, the South, the East and the West they are accessible by tramway lines which actually meet there, while they are distant only a few hundred yards from the two main railway stations for the city.

Your petitioners have been informed that when the Antiquarian Museum was removed from the Royal Institution to its present situation in Queen Street the attendance declined from 72,000 to 18,000 persons annually, owing simply to the fact that the new rooms, though much more commodious, were neither so accessible nor so central as the Royal Institution. The National Gallery is visited by upwards of 70,000 persons annually, and it is impossible to doubt that a very great declension in numbers will follow its removal to either of the sites proposed.

Your petitioners are as much interested in the Royal Academy as in the National Gallery, and it seems to them that everything points to the conclusion that of the two buildings on the Mound one should be devoted entirely to the Academy and the other entirely to the Gallery. Your petitioners would respectfully recommend that the building now partly occupied by the Gallery should be wholly appropriated to the Gallery, and that the building now occupied by the School of Art and the Royal Society should be wholly placed at the disposal of the Royal Academy.

Should it be objected that the present National Gallery building is not sufficiently spacious, your petitioners beg leave to record their humble opinion that, with slight internal alterations, it may be made large enough for all the works of art worthy of a National Gallery which are likely to reach Edinburgh for a long time to come, and it might even be better to part with some of the pictures of doubtful merit than to sacrifice a situation so absolutely ideal and unique as the present.

The arrangement which your petitioners have with diffidence ventured to suggest, if carried out, will necessitate other accommodation being provided for the Royal Society and the School of Art, both now housed in the Royal Institution. Your petitioners humbly submit that another and more convenient situation further west may easily be found for the Royal Society, while it is well

recognised that the School of Art is entirely out of place where it now is.

Your petitioners trust that your lordship will discourage any proposal to remove the National Gallery from its present site.

THE RHIND LECTURES.

THE subject selected for this year's course of Rhind Lectures in Archæology is "The Origin and Development of Coin Types," by Mr. George Macdonald, M.A.

In his first lecture, after explaining the scope of the course and laying down certain preliminary definitions, Mr. Macdonald gave some account of the method by which archaic coins were produced and the characteristics by which they are distinguished. The invention is not so old as has sometimes been supposed. It dates from the eighth century B.C., and it had its origin in Western Asia Minor, probably among the Lydians. The earliest coins were minted in electrum, a natural alloy of gold and silver. The introduction of a bimetallic currency is usually attributed to Croesus. Such a system was in full force throughout the Persian Empire in the sixth century. A knowledge of the art of striking coins had also spread westwards with great rapidity. By 600 B.C. the practice was general throughout the civilised world, except among the Phœnicians, who, in spite of their keen commercial instincts, were extraordinarily slow to adopt it. In Europe silver was practically the only metal employed for coinage purposes for about 200 years. Gold was but little used until after the Thracian mines had been opened up about 350 B.C. by Philip, father of Alexander the Great. The almost bewildering variety of Greek coin types is due to the fact that each city was a separate political entity, and prided itself upon its possession of the right of striking money. The use of a distinctive type for each minting centre was regarded as imperative, in order that there might be no confusion with the coinage of its neighbours. In spite of the variety, experience soon learns to detect affinities between the issues of cities that lay within a given geographical area. There is always a certain degree of homogeneity between the devices employed as types in a given district at a given time, a principle that forms a useful touchstone for testing the theories that have been advanced to explain the origin and essential nature of types. The religious theory and the commercial theory are the most important of these. The religious theory has the support of eminent names like Curtius and Head, and may fairly be said to represent numismatic orthodoxy. Starting from the indubitable fact that many types have a religious significance, it insists that there is an intimate connection between religion and the minting of money. Its advocates hold that if the oldest coins were not actually struck within the sacred precincts of the temples, they were at least impressed with Divine symbols in order that the gods might be called to witness that the quality of the metal was good and its weight full and true. One serious objection to this view is that it fails to account for "canting badges," or devices that contain a pun on a place-name, like the rose at Rhodes. Another is that the further back one goes the less pronouncedly religious do the types become. The religious influence is most obscure just where we should expect it to be most obvious. The commercial theory, which was first propounded by Professor Ridgeway, of Cambridge, ingeniously endeavours to establish a direct relation between the devices on the most archaic coins and the primitive barter-units, such as the ox, which was superseded in the various districts by the institution of a metallic currency. Hence the types of coins often represent what we know to have been the chief article of trade in the neighbourhood of the city under whose authority they were struck. Attractive as this view is, and skilfully as it has been defended, it will not bear detailed examination. It breaks down in particular cases, and it fails to stand the test supplied by the principle of local homogeneity. The true point from which to start is the fundamental identity between type and symbol, the symbols being subsidiary devices which indicate the responsible magistrates, just as the types proper indicate the issuing cities. The objects chosen for representation are precisely the same in the two cases, and "canting badges" figure in the one group just as in the other. That the functions they discharge are also analogous is shown by the readiness with which type and symbol can be interchanged. This point was illustrated by examples from the coinage of Abdera

and of Athens, as well as from the beautiful series of pieces struck at Cyzicus and at Lampsacus.

The second lecture began with a description of the ancient practice of sealing. There was a probability that the minting of money was originally nothing more than the act of impressing a seal upon a piece of metal as an official guarantee of its weight and quality. Like other public documents, coins might be attested either by the seal of State or by the signet of a responsible magistrate. On much of the electrum currency of Asia Minor the types were of the nature of private signets. On other series the badge was generally indicative of the State, not of an individual. The clue to the origin both of types and symbols was to be sought for in heraldry. Just as a magistrate might employ his hereditary crest as a symbol, so a city might employ its coat of arms as a type. In the case of some fifteen or twenty Greek cities there was epigraphic or literary evidence as to the device which was regarded as the town arms, and in every single instance that device was found upon the coins. On the other hand an examination of the coinage of Athens of the "New Style," where the opportunities for observation were particularly favourable, revealed the fact that the emblems used by magistrates were sometimes specially selected, the precise motives of choice being discoverable. Similarly it was shown that types were not necessarily coats of arms, and that the likelihood of their being so was certain to decrease as coinage grew and developed an independent importance. The influences that could be traced as affecting the selection of devices were grouped under four heads—the decorative, the imitative, the commemorative and the religious. In its widest sense the decorative instinct was always present. At some epochs it was always paramount. The art of coin engraving reached its zenith in the fifth century B.C., some of the finest dies being signed by the artist who executed them, a feature far more significant on coins than corresponding signatures on painted vases or on gems. The influence of the decorative instinct in its narrower sense betrayed itself in the tendency to arrange objects in pairs or in groups of three—to design patterns, in fact—and also in the extent to which the older coins reproduce subjects that were consciously borrowed from that far older art in which Greek art, as we understood it, had its roots. This latter characteristic might equally well have been treated as a manifestation of the imitative impulse. But it seemed best to reserve the term imitation for cases where the type of one coin was deliberately borrowed from that of another. Specially successful devices might be copied through sheer admiration for their beauty. The creations of the Syracusan engravers, Kimon and Euainetos, for instance, enjoyed an immense popularity. They were imitated throughout the whole Mediterranean basin from Thessaly in the north to Carthage in the south, and from Spain in the west to Cilicia in the east. But appreciation of artistic excellence was not the sole, or indeed the main, reason that prompted imitation. The fact that coins enjoyed a high reputation commercially was sometimes sufficient to single them out as desirable models. This was the ultimate basis of what were called "barbarous imitations." The silver tetradrachms of Athens were copied as far east as India. Their very popularity led to their style being stereotyped at a comparatively early period, with the curious result that the coins of the age of Pheidias were immeasurably inferior to the contemporary issues of other States. The popularity of the Athenian silver was subsequently rivalled by the popularity of the gold staters of Philip of Macedon. Philip's coins had a particular interest for students of British history, since it was upon them that the oldest currency minted in our island was modelled. Its first beginnings might be placed about 150 B.C. The coins were of native gold, and the types were borrowed from the Gaulish imitations of Macedonian coins which had made their way to Western Europe either through the seaport of Marseilles or overland by the valleys of the Danube and the Rhine. Early British coins had been made the subject of a special study by Sir John Evans, who had not only been able to throw much light on the unwritten history of the ancient Britons, but had also placed the whole question of barbarous imitations on a scientific footing by deducing the general laws that governed the evolution of types. These laws were found to be equally potent everywhere, controlling, for instance, the whole process by which the currencies of Parthia, Bactria and India developed out of the money of Alexander the Great and his successors.

Mr. Macdonald, in his third lecture, began by discussing the commemorative influence as it affected the selection of

coin-types. There are many ways in which this influence might betray itself, its object being to secure some device that would serve as a shorthand sign for the place itself, and the meaning of which could hardly fail to be understood by those into whose hands coins bearing it might come. Canting badges were commemorative in this sense, and so were allusions to natural features such as rivers and mountains. It was for a similar reason that local plants and local animals were chosen, and closely akin to this was the practice of representing local sports and pursuits, like bull-fighting in Thessaly or chariot-racing in Sicily. References to the origin of a city were common. Colonists, for instance, might continue to employ the types they had used in their old home. Imaginary portraits of legendary founders were very popular. Indeed, local mythology generally was largely drawn upon, some of the fourth century Arcadian types conveying a complete story. Allusions to actual incidents of contemporary history were very rare in early times. Political alliances were, however, sometimes commemorated by a process of uniting two or more single types or by the adoption of some symbolical emblem. Thus the federated cities that combined against Spartan oppression, in the beginning of the fourth century B.C., selected as a common type a figure of the infant Heracles strangling the serpents that had attacked him. Passing on to speak of the religious influence, the lecturer pointed out that it was in all probability ultimately derived from the preceding. It could not but happen that the most striking characteristic of a city, that by which she was most anxious to be known amongst her neighbours, was often an intimate connection with some deity. Athens was a case in point. The types in use there were the head of Athena on the obverse and her sacred bird, the owl, on the reverse. The same relation between the two sides is frequently observable elsewhere. But if it was through the promptings of the commemorative instinct that religious types first found a place upon coins, in the course of centuries the commemorative influence, where it survived at all, sank to a level of secondary importance. Examples were given of series which were completely dominated by the religious motive. The types of the fourth century B.C. were contrasted with those on the archaic coinage of the same towns, with the view of showing what a remarkable change of fashion had occurred in the interval. The actual process of this change was traced in several typical cases, when it was seen that one or other of two things was apt to happen to the device that had originally been the most important if not the sole type. It might be reduced to the rank of a mere symbol in the field. If, however, it continued to be employed as a type, it was usually transferred to the reverse, in order to make room for the head of a god or goddess. Examples and exceptions were discussed in detail. Finally attention was drawn to the close association that existed between the original type and the inscription giving the name of the issuing State. This association accounts for the growth of the custom of placing that inscription on the reverse. Apparent exceptions really confirm the rule.

TESSERÆ.

Indian Cave Temples.

THE most interesting and important groups of these caves are at Karli, between Bombay and Poonah; at Kannari, near Bombay; at Ajunta and Ellora, in the Dekkan; at Nashik, in the valley of the Nerbudda; and in the Island of Elephanta. They consist of temples, vast halls serving as places of assembly, monasteries for the residence of many monks together and small detached dwellings. To these excavations temples for Brahminical idols and for Jaina worship were subsequently added after the extinction of Buddhism; so that frequently in the same group are found vestiges of very different periods, extending over many centuries, the earliest being the Buddhist, the next the Brahminical, the latest the Jaina. It would be difficult to imagine any scene more picturesque, yet more savage and more desolate, than that offered by these remains of an ancient Hindu civilisation. At Ajunta, Kannari and Karli the caves are for the most part in deep, rocky ravines, from whose sides hang the spreading boughs of the sacred tree of the Hindus, and whose bottoms are filled with the densest jungle, the resort of tigers, leopards and other beasts of prey. The entrances are concealed by enormous masses of fallen rock and by tangled brushwood

which almost exclude the light. In the holy Island of Elephanta the solemn temples are surrounded by more gentle scenery. From their entrances the eye wanders over the blue waters of the bay, fringed by the richest tropical vegetation, the spreading palm, the plantain and the coconut tree. The precipitous cliffs of Ellora overhang vast fertile plains, once speckled with thriving villages. Secluded spots appear to have been chosen for retirement and study, and few or no traces of buildings are to be found near these mysterious caves. Their sole tenant is now some crazy fanatic, who, in wasted nakedness, with matted hair and hideous deformity of limbs, passes his days in motionless prayer or daubs with the sacred red the images of the forgotten gods. The silence is only disturbed by an adventurous traveller or by the wild animals that seek shelter in their dark recesses. In an architectural point of view the most remarkable of these excavations are a class of Buddhist temples, singularly like Christian basilicas. They have a centre nave, very narrow side aisles and a semicircular apse, in which stands a domical shrine containing the sacred relics. The ceiling is vaulted in the form of a wooden ribbed roof. Light is admitted through and above the entrance facing the nave, and, streaming through the centre, is concentrated upon the shrine and idol. The side aisles being left in almost complete darkness have an appearance of depth and vastness by no means corresponding with their real size. Altogether the effect of these excavated basilicas is singularly solemn and mysterious.

Bronze Casting.

The method of the ancients in casting bronze statues is not described by any ancient writer, but it is supposed to be this: a fireproof core was first built up of plaster, clay, earth or other materials, and over this a thin and even coating of wax or pitch was spread, or perhaps, which is not so probable, the surface was rasped down to the thickness intended for the bronze, and afterwards covered with a thin coating of wax. In either case the result would be the same. The outside of this wax being then completely covered with sand or packed clay-dust, there would be a thin coating of wax enclosed between the two surfaces, which, melting away before the fused metal, would allow that metal to take its place. This would account for the remarkable thinness and evenness of the ancient bronzes, for by such a method the core would be perfect, and the artist would naturally put on as little wax as possible. If we suppose the statue, after it was nearly completed in plaster or clay, not to have been rasped down but simply to have been covered with wax, we shall see that the result would be that the bronze cast would be a little fuller in size and thicker in proportions than the original model. And this is a peculiar characteristic of the ancient bronzes, especially to be observed in the limbs and joints, which are generally larger and puffier in bronze than in marble statues.

English and French Churches.

The French architectural student would be as much struck and learn as much on visiting a group of English churches in some district where neither design nor workmanship is spared—for instance, Lincolnshire or Northamptonshire—as we should by a corresponding group of French village churches. The former exhibit a depth, purity and delicacy in mouldings, a studied elegance in the tracery of windows, a symmetry of outline and refinement in proportions, with a careful exclusion from an early period of every incongruous element, which are not so apparent in the French specimens. But in the latter we find a massiveness and grandeur which we look for only in our own large conventual churches. Most of them are either wholly or in part vaulted with stone. Many have the main features belonging to a cathedral—the pier arch, the triforium and the clerestory; and these are so designed as to avoid giving the idea of a model in miniature. The central tower is, on the whole, more prevalent than in England. In some districts it forms the rule rather than the exception, while in others it is very rare. In Burgundy it is the property of all the styles, from Romanesque to Flamboyant; in Touraine it is apparently confined to the Romanesque, or early Transition. As in Germany, it is often octagonal, and the spire shows itself at an early period. The apse is also a more common feature than in England, though in many districts it by no means prevails to the exclusion of the square chancel; indeed, in the smaller Romanesque buildings in the north of France it is doubtful if the latter is not of more frequent occurrence. In southern France the apse is more nearly universal.

Where there are aisles or transepts the main apse is usually flanked by two smaller ones. This arrangement, however, was not unusual in England, as is proved by the large arch so frequently visible in the eastern wall of a transept. The apsidal aisle with radiating chapels is of frequent occurrence in the larger Romanesque churches; in the succeeding styles it became commonly the eastern finish of cathedrals. Where later additions have been made the most unexpected and picturesque combinations present themselves. The large and lofty chancel is added to the nave designed for a smaller structure, or the raised clerestory and roof of the nave almost swallow up the low central tower. The original nave becomes an aisle to a nave of later date, and the central tower becomes a lateral one. Aisles and chapels are added with but little reference to the scale of the buildings, and frequently have the effect of a series of transepts joining each other and terminating in gables. These may not be architectural beauties, but they increase the interest both to the student and the artist.

Professor Adams and his Pupils.

SIR,—Mr. Henry Adams is retiring from the Professorship of Engineering and Surveying at the City of London College, which he has held for upwards of thirty-five years. A committee of some of his former pupils has been formed and has met at the Surveyors' Institution for the purpose of commemorating the occasion. It is desired to communicate with as many of his old pupils as possible, and for this purpose I should be very greatly obliged if you would give publicity to the matter by publishing this letter in your valuable columns. Mr. Adams has lectured to about 4,000 pupils, the great majority of whom cannot now be traced except through the courtesy of the Press. Would any of them who see this announcement kindly communicate with me? Their signatures only to an address are sought.—Your obedient servant,

J. L. CROUCH, Chairman.

29 Basinghall Street, London, E.C. :
March 29, 1905.

GENERAL.

Mr. J. W. Simpson has been appointed architect to the Honourable Society of Lincoln's Inn.

The Edinburgh Architectural Association are arranging a week-end visit to London from April 14 to April 18. Several visits will take place on the Saturday and Monday.

Dr. Maurice Letulle, a Professor of the Paris Medical Faculty, has protested against the scheme for letting out the site of the razed fortifications of the city for building purposes. The health of Paris will, he declares, infallibly suffer.

The Kelvingrove Gallery, Glasgow, has been opened to the public two years and two months, and was visited during that period by nearly three and a half millions of people.

The French Council of Technical Education have adopted a proposal to make technical education compulsory under certain conditions. It is recommended that persons of either sex under eighteen years of age in commercial or industrial employment should have to go through a study adapted to their occupations.

Mr. Stanley Dunkerley has been appointed Professor of Engineering in Manchester University. Since 1897 he has held the office of head of the department of applied mathematics at Cambridge.

A Paper on "The Ancient Architecture of the Great Zimbabwe" will be read by Mr. R. A. Hall at the meeting of the Society of Arts on Wednesday next.

The Chancellor of the Duchy of Lancaster has delivered up the old seals (of Queen Victoria) of the Duchy and County Palatine of Lancaster and received from His Majesty the new seals, which have been executed by Mr. Frank Bowcher from designs of the late Mr. G. W. de Saulles.

Mr. Douglas Willis has been appointed county architect and surveyor by the Denbighshire County Council at a salary of 650*l.* per annum and expenses. Mr. Willis is forty years of age, and is engaged in the borough engineer's office at Norwich.

Excavations are now proceeding at Metz for the enlargement of the town. Among other finds are the ruins of the old Roman amphitheatre, which had, unfortunately, to be completely extirpated, in order to get foundations for the new railway station. Under a lunette to the west of the old station was found the crypt of the ancient abbey, containing the tombs of Louis le Débonnaire, of Saint Arnoul and the Empress Hildegard, which was wrecked by order of the Duke of Guise in 1552 during the siege by Charles V.

The Secretary of State for India is now prepared to receive applications for about thirty-five appointments of civil engineers for temporary service in India. Full particulars may be obtained from the Secretary, Judicial and Public Department, India Office, Whitehall, London, S.W. Candidates must be between twenty-four and thirty years on July 1, 1905.

The French Minister of Fine Arts has refused to give permission for the construction of the underground railway beneath the Louvre or under the Arc du Carrousel. It was proposed to have a station at the latter place, but the inhabitants prefer to have it nearer the Palais Royal.

Mr. William Sturge, who was president of the Surveyors' Institution from 1878 to 1880, died on Sunday last in Bristol. He was in his eighty-fifth year. For fifty years he was head of the firm of Messrs. T. P. Sturge & Son, surveyors. He was land steward of Bristol for many years.

The Exhibition of Designs prepared in the competition for houses for the working classes on the Rothschild foundation will be exhibited in the Hôtel de Ville, Paris, from Monday until Saturday in next week.

The Applications for the chief-engineership of the City of London have been reduced to the following:—W. Nisbet Blair (St. Pancras), A. E. Collins (Norwich), Wm. Oxtoby (Camberwell), Norman Scorge (Hackney) and Frank Sumner (Woolwich). The salary commences at 1,000*l.* a year and rises to 1,500*l.*

The Secretary for Scotland has invited a number of parties interested to a conference with him on the Scottish National Gallery and other allied questions, to be held in Edinburgh on April 7.

M. Jousely has obtained the first prize of 35,000 francs in the competition for laying out new suburbs for Barcelona. There were only five competitors.

Mr. Andrew Murray, the City surveyor, retired on a pension on Saturday after an association of over half a century with the Guildhall. The staff of his office presented him with a Chippendale cabinet, and eighty of the men in the works department gave him a tandalus.

Mr. Walter Thomas is engaged in preparing a report on the suitability of Carnarvon Castle to serve as the Welsh National Museum.

A Party of members of the Edinburgh Architectural Association visited Inveresk on Saturday. Note was taken of the Roman remains in Inveresk House grounds, and the leader of the party declared that, if the proprietors of the villa houses in Inveresk were to unite, they might, at very little expense, conduct some excavations on a very complete plan, and make the Roman town of Musselburgh so that people would be enabled to form a better idea of the importance of the place in Roman times, an importance which at present was not at all understood.

The Margaret Stokes Memorial Lectures at Alexandra College, Dublin, are this year being delivered by Mr. Romilly Allen. The subject of the first lecture, which was delivered on the 28th inst., was "Celtic Origins and Celtic Metal Work of the Pagan Period." The remaining two lectures will be on "Celtic Metal Work and Illuminated MSS. of the Christian Period" and "Celtic Sculpture and the Evolution of the High Cross of Ireland."

Mr. Frederick Sandham Waller, architect, of College Green, Gloucester, died on the 22nd inst. at the age of eighty-two years. Mr. Waller was at one time in partnership with the late Mr. Thomas Fuljames, Gloucester. For many years Mr. Waller was entrusted with the charge of Gloucester Cathedral, and he was associated with the late Sir Gilbert Scott and Mr. John Pearson, R.A., on the restorations carried out from time to time. He was also largely associated with church restoration in the diocese and elsewhere.

WALTER BRIERLEY, Architect.

The Architect.

THE WEEK.

It is to be hoped the Workmen's Compensation Bill, which was read a second time on Tuesday, will be introduced before it receives the Royal assent. The original Act was a masterpiece of bungling, and the variety of decisions on different points testified to the ineptness of the draughtsman. But when we find a lawyer with the experience of Lord DAVEY declaring that the new Bill was very hard to understand and that he was not satisfied it would prevent the most serious defects in the existing Act, we have an intimation of the difficulties which are sure to arise in County Courts. Lord DAVEY was of opinion that the old Act should have been repealed; and builders will be sure to agree with him for they must believe that the new Act will repeal the old, and they are doomed to suffer as formerly. Another peer considered the Bill was the most unintelligible of all within living memory, and Lord JAMES OF CRAWFORD, an able lawyer, acknowledged the difficulty of understanding the Bill, and therefore of interpreting its clauses. Benevolent legislators are likely to make use of the warnings, because the scope of the Bill is much wider than that of its predecessor. But what should be kept in mind is the working of the Act here. It is well to guard the interests of workmen, but care should be taken to avoid injustice to employers. There can be no question about the existing Act having created prejudices between employers and employed which should not be perpetuated or embittered.

CONSTANTIN MEUNIER, whose death was announced on Wednesday, was one of the most remarkable of modern artists. He was equally successful in painting and in sculpture. He resembled MILLET to some extent, although he was wanting in tenderness. He treated the workmen in foundries, coal-mines and on the peasants at field-work. The result is realism of a kind which some people were unable to admire. There is no question of the energy of his figures, and in seeing them the remarkable prosperity of Belgium is easily understood. His work is no doubt a departure from the old system through which heroic figures were supposed to be suitable for sculpture. However, the innovation corresponded with social changes, and hereafter his figures will be taken as a sign of the spirit of the time when they were created.

The action between the Corporation of Plymouth and the firm of PETHICK BROS. suggests that the old system of contracting has deteriorated in England. The work undertaken was difficult, and it had to be left to the control of overseers. But evidently because it was not from work which was executed above ground, it therefore could not be always under close observation by both workmen and those over them executed the work in an unauthorised manner. In 1900 the Corporation entered into a contract with Messrs. PETHICK to construct an outfall sewer which was to be carried into the bed of Plymouth Sound until a depth of 20 feet below water was reached. The contract was for £21,000. When the work was completed Mr. PETHICK, the engineer, employed an assistant to inspect it. But as that was troublesome he was not with taking information from the contractors' after the completion of the work the result appeared unsatisfactory. Divers were employed, and it was found the pipes were not carried to the proper depth. The Corporation therefore claimed £25,421.10 for the cost of contract and expenses which followed. The case lasted for eight days before Mr. Justice LAWSON. For the defence it was stated that when Messrs.

PETHICK discovered the facts of the case they were ready to guarantee the work for ten years. Everything had been done to have the work carried out satisfactorily. Counsel for the defendants came to the conclusion that it would be wiser to settle the case. It was fought because a charge of fraud had been made which involved the late Mr. PETHICK. An assurance was then given on the part of the plaintiffs that there was no fraud attributed to Messrs. PETHICK, but at first it was difficult to distinguish between them and their agents. The Corporation agreed to accept £20,000. and costs. At one time "contractor's men" were found to be not only skilled but trustworthy. It is to be hoped that they are not becoming deteriorated, for that would be fatal to one variety of English enterprise.

VISITORS to continental churches are sometimes annoyed when they find masterpieces of architecture wholly or partially concealed by drapery, which is sometimes twisted round columns or hung in front of statues or reliefs. On such occasions festivals which have interest for the congregation are being celebrated, and a stranger has perhaps no right to complain. In English churches there is at Christmas and Easter a similar veiling, although vegetation is employed instead of textiles. The arrangement is not always satisfactory, but there is no hope of a change so long as the clergy and ladies of the church exercise control. One protest has come from the Rector of Hawarden. In suggesting that the decorations of the church at Easter should consist of flowers in pots, he adds:—"There is a danger (and it has a tendency to grow like all other dangers) in the over-decorating of our churches and in the spreading of such decorations all about a building, often to the concealment of its natural beauty and outline and to the injury of its furniture, which may contain perhaps articles of beauty that should not be hidden. In proportion as a church is adorned with beautiful and artistic furniture the greater should be the care taken in avoiding injury to or concealment of such articles at our chief festivals." It would be an advantage if a similar mode of decoration were adopted generally in churches, and it would be more suggestive of the interest of the parishioners than the usual mode of decoration.

As light and air cases usually relate to important buildings, there is novelty in finding one arising out of an alleged obstruction to the windows of a house which cost £425. by the extension of the gable end of the adjoining house which cost £400. The pair are in Edgbaston, and plaintiff and defendant are ladies. There was an array of architects and house agents on a grand scale. The kitchen it was testified on the part of the plaintiff had been rendered very gloomy, and it was impossible to read or sew without the aid of gas. Defendant's witnesses were no less convinced the lighting was satisfactory. Mr. Justice BRAY visited the premises and he found he was able to read the smallest type of the *Birmingham Daily Post* in the darkest corner of the kitchen. His Lordship said he could not under the circumstances come to the conclusion that there was a substantial deprivation of light enough to render the occupation of the house uncomfortable according to the ordinary notions of mankind. There might have been some diminution of light, but not such as to give a right of action. If the building had been raised 2 or 3 feet higher, as was intended, it might have made a substantial difference, and although he could not say that even then there would have been a right of action, there would have been a reasonable excuse for bringing the action. His Lordship, in giving judgment for defendant, allowed all costs of proceedings after August 5. In this case, as in several others, the influence of the COLLS judgment is apparent.

THE PARTHENON.

THE announcement that M. CAVVADIAS, the Greek official archaeologist, intends at the congress in Athens, which opens to-morrow, to raise a discussion about the principles to be adopted for the restoration of ancient monuments, and particularly of the Parthenon, has fluttered many academic and artistic dovescotes throughout the Continent. It would seem that individuals and societies have interpreted the proposal as if it advocated the practices which are most obnoxious to them. Some think the Greeks are about to attempt to rejuvenate the Temple of Athéné. They see visions of coloured and gilded architecture, sculpture restored in plaster, and much else which is assumed to have characterised the structure when it was in a state of perfection. As there are many theories about the building, some archaeologists are afraid that those of their rivals may be exemplified.

There are, however, other archaeologists who realise that a new spirit is beginning to inspire those who are engaged in explorations. They are not satisfied with the discovery of a few treasures over which they can rejoice and then leave the major part of the remains to be regarded as *débris*. Out of the fragments they endeavour to reconstitute architectural or sculptural details, and in that way an astonishing amount of success has been attained. M. CAVVADIAS, in spite of limited means, has been able to reveal the buildings of Epidaurus with a clearness and completeness which would be considered impossible during the greater part of the nineteenth century. M. HOMOLLE, having a more restricted task, was enabled not merely to reveal, but to make a restoration of the treasury of the Athenians at Delphi. In this work he has employed only fragments of the original, and his structure is, as he says, not a work of the imagination, but one marked with absolute certainty and indisputable truth. The enterprise required unusual patience, for some pieces of stone were found at a long distance from their proper site. We must suppose that M. HOMOLLE does not exaggerate, and that he describes his treasury with as much exactitude as if he were a witness in a Court of Law. His description has been corroborated by other archaeologists. M. CAVVADIAS has also been able to add to the interest of the Erechtheum by utilising fragments which were on the site. He has, moreover, been successful in experiments at the temple of Phigaleia. May we not then suppose that something might be added to the Parthenon by means of the large and small stones which are scattered around the temple, an addition which would increase our knowledge of the arrangements?

It is impossible to tell until an effort has been made how much of the Parthenon is to be found in these remains. Seeing such a heap of fragments, the early travellers took a despairing view of the situation. DODWELL, who visited the Acropolis in 1801, said that, a little more than a century before, the description of PLUTARCH was still applicable to the Parthenon. According to the biographer of illustrious men, the "structures which PERICLES raised are the more admirable, as being completed in so short a time, they yet had such a lasting beauty; for as they had, when new, the venerable aspect of antiquity, so now they are old they have the freshness of a modern work; they seem to be preserved from the injuries of time by a kind of vital principle, which produces a vigour that cannot be impaired, and a bloom that will never fade." DODWELL wished to show what was the result of the bigotry of creeds and the plundering of artists and amateurs. Like other enthusiasts for Greece he was shocked by what was done by Lord ELGIN, whose example was followed by men of a different class. But, like some of his contemporaries, his thoughts were mainly occupied by sculpture, and he gave no attention to the character of the architectural relics which were lying at his feet. Lord ELGIN'S success incited other people to obtain fragments. The ignorant Turks, who

looked on all representations of the human figure as idols, preferred to use carved marble for the walls of their houses or for making lime. The practice continued, for, according to JOSEPH WOODS, the architect, who examined the Parthenon in 1818, the young Turks endeavoured to break off fragments to sell to the Franks, and the petty officers and sailors belonging to merchantmen and ships of war were no more respectful of the temple. "Thousands of broken pieces, evident from the building and which they might almost find lying about," says WOODS, "but nothing will save them unless they perform their share of mutilation and repeatedly on my visits to the Acropolis I have beheld with sorrow new fractures on the drapery of caryatides, the only objects within their reach." There is no record of any desire to obtain pieces of columns or of the walls, for to the ignorant people there was no virtue in the marble; one stone was as good as another. If at the beginning of the nineteenth century there was a civilised Government in Athens and if an archaeologist of the type of M. CAVVADIAS was allowed to have control of the ruins, there is no doubt that the Parthenon and some of the other buildings in the Acropolis would present a very different appearance at the present time.

When a stranger looks at the ground he is likely to be convinced that any arrangement of the stones and columns is a hopeless task. But an enthusiast such as CAVVADIAS may see possibilities which would not strike ordinary men. It used to be said that limekilns at one time existed in the neighbourhood of the Parthenon, which were used for the burning of marble from the temple. But no credit is now given to the statement. It is more likely that the marble was reduced to rubble through neglect, and that it forms a part of the soil. Nothing is supposed to be lost in nature, it is easy to imagine that some of the stones which now appear without character were at one time part of the inner or outer columns. If one example of the former could be reconstituted by genuine fragments the world would be enriched and an important problem solved.

When the difficulties are considered which await man who attempts to make a satisfactory column out of the remains which have survived, it is absurd to suppose there is a conspiracy to transform the ruins into a complete temple. Greece is not rich enough to undertake such an enterprise, and there is no civilised country that would be a party to one of the grossest acts of vandalism ever committed. The ruin in its present state has a tragic beauty which would vanish if any attempt were made to alter its character. M. CAVVADIAS should, however, be allowed to try an experiment with the stones which are to be found near the Parthenon; they would not suffer by any effort to bring them into a tectural order.

Enthusiasts who may wish to see the Parthenon restored into some semblance of its former self must be allowed, offering a tribute to the power of ancient architecture, or rather of Athens. Although we live in an age in which yesterday almost appears as antiquity, ancient Greece exercises its power over us. The goddess of the Parthenon is still supposed to symbolise wisdom; or, if we will, genius or intellect. As such it seems sacrilege to have in any way desecrated the Temple of Athéné. RENAN was no doubt posing for a kneeling on the sacred hill, he implored pardon for the who had stolen the sculpture belonging to the temple to enrich Western cities. He and other sentimentalists believed that one day there would be solemn restitution. In order that the victory over selfishness might be complete, it was desired that the temple should be prepared to receive its original, its proper adornment. Men have to change their nature before heroism of that kind is possible. The sculpture, wherever it is, is an extension of those arts which ATHENS represented. The noble figures compel men to think of Athens and the dispersion has therefore apparently rendered

service to the goddess. They are not perfect, and it is not perhaps possible to restore them to their original condition. But it is far less feasible to renew the temple. Its original arrangement cannot be revealed. It is better therefore to leave it as it stands as a memorial of knowledge may die out, and that the victorious combatant of NEPTUNE cannot cause a few columns to rise with the same facility as the olive tree once sprang from the barren soil of the Acropolis.

PLANNING.

THE general significance attached to the word "plans" exemplifies how easily the most important part of a collection of things can be taken for the whole. A majority of people will accept a series of designs as plans. This mode of interpretation is not due to accident. The statues of early Eastern kings which we see in the Louvre all have slabs on their knees on which plans are inscribed. It would be more interesting to see the rough sketch of a building were given in each case, but evidently in those remote times the importance of a plan was recognised. It may have been accepted as a symbol of orderly government. When a statue of an architect is commissioned his office is suggested by a scroll on which a plan of one of his most noteworthy buildings is graven. Modern criticism does not underrate the importance of the plan. Many errors of error in building can be rectified, but if the planning is inconvenient or unsuitable the only proper course is re-erection.

There are some architects, or perhaps it would be more correct to say there were some, who have a fear of following the plans of their buildings to be seen by one except their clients and the contractors. Some of that class sometimes propose the registration of plans, and we believe there is one case where a plan has been patented. But there is little use now in concealment. When we find inspectors asking for a plan of a school as an exercise for students in geography, it becomes evident that even at an early age children can be made to know something about the nature of a plan. In technical classes what used to be a mystery is explained, and there are few builders who have not apprentices who are competent to make a plan of any building. Plans of convenient houses are now often copied than is generally supposed.

When Mr. PERCY MARKS's book on planning first appeared we were glad to welcome it, because it was a protest against that secrecy which is more common in architecture than in any other profession. It presented a variety of buildings, and, what was of no small value, it explained the broad principles of planning. The author did not adopt the professorial tone, but spoke as if one student were addressing another. The book was successful, and a second edition has now appeared, which may be said to be nearly double the size of the original work. Instead of eighty there are now 126 plans, and 126 pages of text have grown to 220. In addition the same anxiety for accuracy, even in details, is to be observed, for, as the author says, "an architect should not deem any point too trivial;" the new book is deserving of a place in every architectural student's library. Among the buildings which the author selects as additions are the new Theatre, the Colchester Town Hall, Lord Mayor's town house, Mount Street, W., the Carlton Hotel, Battersea electric power station, examples of business premises, barracks, a Congregational church, a synagogue, a provincial post office, houses, a village hall, stables and a golf club-

In many ways we can see the effect of a further continuation of the subject. For instance, in describing

The Principles of Planning. An Analytical Treatise for Architects and Others. By Percy L. Marks. Second edition, revised and enlarged, with many additional examples. (B. T. Batsford.)

model dwellings on the Millbank estate it was said "the minimum size of a living-room may be taken at 120 feet super, and one bedroom should be not less than about 130 feet and a second 90 feet to 100 feet superficial." It is now added:—"In the dwellings provided at Tottenham by the London County Council the minimum size of a bedroom is 96 feet superficial; the provincial authorities are frequently less liberal, 85 feet superficial or less as the minimum size being in evidence." Mr. MARKS believes that "science is measurement," and his pages abound in dimensions of all kinds. He gives a table of them, which will often save trouble in planning. In the first edition there was no plan of a synagogue. Now one is given of the West, London, which we are told, though not typical from the orthodox Israelite's standpoint, is full of interest and information. The illustrations of clubs are extended. The dairy is an addition. It is remarkable that in describing hotels the provision of stock-rooms was neglected, but it is now corrected. An extract from a paper by Mr. JOHN LEIGHTON, the book-binder, relates to libraries or book-rooms in private houses:—

There should be but one external wall, and that north, thus ensuring an even, steady light, without glare of sunshine or heat, which parches and causes the colours to fade. A room on the first floor or above a vaulted chamber is preferable as tending to keep the books dry. Bookcases should not approach too near to the ceiling, where the air is hot and vitiated, tending to destroy leather. The lowest shelves may well project at least 18 inches for folios, thus providing a ledge whereupon to rest these and similar large and bulky works. A gallery is a useful feature in a library. The shelves throughout should by preference be of one width, so that books may be transposed *en masse* when necessary. Bookcases may be advisedly not more than 4 feet wide and not deeper than royal 4to on the upper tiers.

Instead of the plan of the asylum at Brentwood, one is given of the lunatic asylum at Horton, of which there is a replica at Bexley Heath. A comparison of the two plans will suggest the extraordinary development of the system. A plan is given of the public market in Cardiff, and the borough surveyor, who is the designer, remarks on it, "the gallery shops and stalls have proved unworkable generally throughout the country, the ground floor having to accommodate all classes of goods. The butchers' shops would be better if fitted as two to each 24-feet bay instead of three to the bay." Market people are difficult to please. The costly market at Bethnal Green which the Baroness BURDETT-COUTTS erected failed from its opening to attract buyers or sellers. The only reason that could be adduced was that from its Gothic character the people imagined it was connected with ecclesiastical functions, and that they would be subjected to sermons if they attended. An article relates to refreshment-rooms. The regulation of the London County Council, that if possible inclines should be used instead of steps in theatres and other places for public entertainment, the gradient not being more than 1 in 10, enables Mr. MARKS to alter the chapter on staircases. He adopts the rule of giving 66 as the result of multiplying tread and riser; 8-inch and 9-inch treads would therefore be rarely adopted, and 10 by 9½ would have the preference. Mr. MARKS, although he is an enthusiast for planning, does not assume that by itself it is all-sufficient, or that a well-planned building must necessarily be a beautiful one. In his concluding chapter he writes:—

Beauty of plan exists merely on paper so far as buildings are concerned, and in the process of transference from the draught to the embodiment the lines of the plan lose their significance as elements of beauty as they become merged in the lines of the elevations; it is in the latter that beauty as a factor of design plays a part, and one, it must be remembered, of great import. The pleasure afforded by an "aesthetic plan" begins and ends with its appearance on paper. To perpetuate it, it would be necessary to invoke the services of a Santos-Dumont, whose airship would require to be poised directly over the building to be viewed,

and at a sufficient height to focus the whole and to obtain the effect of mass as opposed to detail. Indeed, to carry the argument to its logical conclusion, in order to obtain an effect similar to that afforded by the draughtsman's typical plan, it would be necessary to slice away the roofing, to blacken all sectional walling and limewhite all floors and finished surfaces. It is a matter of wonder to the author that this want of value of planaesthesia in regard to buildings is ever questioned. When, however, landscape gardening or pavement decoration is under consideration, then planning is to a great extent both means and end, and, as a result, the æsthetics of line and form require every attention.

Mr. MARKS pursues his analysis so far, it is difficult in a limited space to enable a reader to realise the amplitude of the treatise. Like WOTTON, he considers "Commoditie," or commodiousness, should have precedence of "Delight." His book will serve both as a guide and for occasional reference. Its suggestiveness will help others besides students to recognise its utility.

MURAL PAINTING.*

IN the first volume of Mr. WESTLAKE'S comprehensive history of mural decoration he treated of the subject as it was practised by Greeks and Romans, and by the earliest Christians. It could not be said that there was much difference between the earlier and the later productions. The artists who worked for the Christians worshipping in the catacombs were not likely to be Christians, or only in exceptional cases. The latter, although they might be sincere in their new belief, could not throw off their old mannerisms as readily as they changed their theory about a future world. The result is that a Pagan style is to be found in most of the paintings which the Christians placed over their altars or near the tombs of confessors and martyrs. Nude amorini in vineyards, figures that were copies of statues of heathen divinities, and much else that recalled the old mythology were depicted. It might have been intended as a ruse to deceive the Roman authorities. But as long as such work was in favour there could not be a distinctive Christian style.

It cannot be said that in the first part of Mr. WESTLAKE'S volume we see illustrations which may be considered as distinctive of a new style. As the author remarks:—"The notion which seems to possess many minds is that under Christianity a new sort of art rapidly sprang up, and that 'Christian art' immediately came into existence. On the contrary, the translation of forms and ideas into a new art was very slow, and was not accomplished until probably the fifth or sixth century in any reasonable way. The various divisions of Pagan cults each had their own symbolism; these symbolisms were naturally used for a very long period by the new Christian nations to carry the new doctrines exactly as they carried the old ones. Little by little a selection from all the old forms was made, and such selected symbols, like selected phrases, were used to express common Christian ideas."

The new doctrines were, however, too powerful to be pictorially expressed by ancient forms. Beauty was the highest aim of the Pagan artist, but in the new creed that quality was of no account. The prophet's words, "There is no beauty in Him," were applied to the Founder, and soon a disregard of all that an ancient painter or sculptor would admire became characteristic. Not only so, but in the course of time efforts were made to adopt the hieratic system in Egypt, by painting the faces which were to be seen in churches according to fixed principles. A new influence arose, viz. the Byzantine. According to MACAULAY, the one benefit of the Byzantine Empire

was the preservation in the midst of barbarism of masterpieces of Attic genius. But it cannot be asserted that their Christian paintings or mosaics were reminiscent of the days of APOLLO or PHIDIAS. No doubt ornament they showed some ingenuity, but their figures have a stiffness which does not suggest beings who were alive. When seen as masses of varied though subdued colour in dark buildings the pictures have a decorative effect, but if impartially studied they demonstrate that art was fettered. Mr. WESTLAKE by numerous illustrations reveals the progress of art; the wall-paintings are compared with paintings illuminated manuscripts. Examples are given from France and Germany as well as from Italy and Greece.

Many readers will take more interest in the chapter relating to mural painting in England to the end of the twelfth century. The fragments found at Silchester prove that the Romans were not forgetful of painting while they were in England. Whether the natives were inspired by seeing what could be done by Roman art Mr. WESTLAKE declines to discuss. He prefers to judge of early English art from manuscripts and stray pieces of carving and sculpture. The illuminators are likely to have furnished designs for paintings which were produced on a larger scale. He believes it is very probable that there was a chief designer in each scriptorium, who sketched in the compositions of the manuscript and gave rough compositions to the painter and carver. The sketches, when found in certain MSS. combined with finished illumination, generally show great artistic skill. This is particularly evident in a MS. of the fourteenth century in the British Museum (2 B. v) "wherein the finished illumination lacks the life of sketch." By whatever process they were produced there is no doubt that at an early age English churches were comparable to those on the Continent. According to Mr. WESTLAKE:—

The known learning of the world was as central here as elsewhere, and the international communication of literature and art greater then perhaps than now. The paintings at Canterbury, at Clayton, at Copford, at Durham and a number of other places remind us of those at Constantinople, at Rome, in Southern Italy, or Palermo; only was the monastic intercourse perpetual, but Norman domination was potent in the eleventh century nearly all these places. We shall find the same general details of drapery, of ornament, of furniture, and in some cases of physiognomy preserved, although as the national art develops this latter changes first. One will not, therefore, be surprised to find the almost exact resemblance of details here and as far as Southern Italy, Sicily, or Greece. But it is not necessary longer to dwell generally on these things, as they must be recapitulated in the description of local art. There remains not the slightest doubt, from authentic accounts still existing, that the churches of England were as richly painted as those in any other country of Europe. The terrible havoc worked by Danes destroyed all or nearly all of the work in the buildings, and even the buildings themselves. There is, however, some passages from coeval historians, giving the strongest evidence of my assertion. An oft-quoted passage in Bede's "Lives of the Abbots" tells us that St. Benedict brought over designs from Rome, which he painted on the walls of his monasteries. This passage also tends to give evidence of the practice of multiple designs on a small scale in the scriptoria, which small designs were sent or carried away for enlargement on the wall. Of all the paintings of the pre-Danish period, however, hardly a fragment remains. The only ones which could hazard to place at an earlier date are two heads in the Clayton Church, but even these are open to question.

Mr. WESTLAKE presents several sketches of fragments which have survived of English work, and it is evident that they have a family resemblance to earlier examples which were produced in Italy in manuscripts and wall-paintings. Without illustrations it would be impossible for us to give a notion of their style. Mural painting, according to the author, "gave beauty and splendour to temples, palaces, and houses, reduced the melancholy of the tomb and consoled

* *An Elementary History of Design in Mural Painting, principally during the Christian Era.* With an introduction on the art of the pre-Christian Period. By N. H. J. Westlake, F.S.A. Vol. II. (London and Oxford: James Parker & Co.)

journer. It rendered comely objects of use, and defined the nature of the user."

An interesting chapter relates to the ornament of the period described. It shows that the rosette, the almette, the fret, the suastica, the spiral, the scroll, the canthus and various other forms were in use. In every instance Mr. WESTLAKE gives his authority for the authenticity of whatever he introduces, and the 229 illustrations may therefore be accepted as trustworthy. The labour and research which the production of such a book required is difficult to estimate, but, like the other works of the author, it is certain of acceptance as a standard authority on a most important and interesting subject.

THE RHIND LECTURES.

IN his fourth lecture on archæology Mr. George MacDonald began by indicating three possible reasons for the growth of an intimate association between coins and religion. The imitative influence probably counted for something. Again, in historical Greece, just as in Mediæval times, the bonds between art and religion were exceedingly close. So far as sculpture was concerned (and it was to sculpture that die-cutting and gem-engraving were most early allied), the activity of the earlier artists was mainly directed into religious channels. Lastly, the coincidence that at Athens the mint was in the shrine of a hero, while at Rome it was in the temple of a goddess, is too remarkable to be set aside as meaningless. It is quite likely that the mint, like the standards of weight and measure, may have been placed under Divine protection to prevent arrangements being tampered with in moments of political exigency. Such a precaution, however, favours rather of a comparatively advanced than of a primitive period. Economic principles are not arrived at by intuitive methods, and it may be doubted whether the full significance of the invention of coins was appreciated by those who first struck them. An examination of a number of separate series showed that the transition to purely religious types was practically completed about 350 B.C. The intensity of the religious colouring on second-century types was thrown into strong relief by contrast with the types of Jewish coins, the earliest of which date from the time of Simon Maccabæus. From then until the days of the Herods, the dictates of Pharisaic orthodoxy were most strictly complied with, and no devices were used by the Jews which it would have been possible to interpret as implying a breach of the Second Commandment. Proceeding next to speak of portraiture, the lecturer pointed out that its connection with coins was a direct result of the operation of the religious influence. The first historical personage whose likeness appeared as a type was Alexander the Great. And even he did not put his own trait upon coins. This was done by his successors after deification. The historical facts as to the worship of living sovereigns correspond absolutely to the phenomena of the coins. Reference was then made to the gradual extinction of autonomous local coinages, first by the action of the Hellenistic kings, and subsequently through the irresistible advance of Rome. The so-called "Greek Imperial" series represents a revival which sprang out of the reorganisation carried through by Augustus. Under the Empire permission to issue a local bronze currency was a distinct privilege. Many of the issues were commemorative in their character, types and inscriptions giving that they were minted on a definite occasion—the founding of a new temple, the inauguration of an *entente* between two cities, the holding of a festival, the celebration of games. These coins usually have an Imperial type on the obverse. The reverse types are very varied, and are often of the highest interest. Architectural representations are frequent—temples, bridges, gateways, sometimes a sketch of a whole city. Personifications of river-gods and mountains were also common. In many cases were actual copies of statues. Literary evidence enables a considerable number of these to be identified with certainty. Sometimes the pose of the figure or figures is the only clue. Occasionally there are unmistakable indications that the original has been a painting. Here and there it is a legend that is illustrated. But over and over again finds oneself in the presence of a familiar story, such as Hector and Leander at Abydos and at Sestos, Hector and his fellow-fighters of the Trojan war at Ilium, where the

artist has evidently worked with Homer's lines in his mind, and Noah's Deluge at Apameia, in Phrygia. Local celebrities form another interesting class, Homer being very popular. Amongst other literary men similarly honoured are Stesichorus, Herodotus, Anaxagoras, Heraclitus and Aratus. There are also types which allude to an emperor's personal connection with a city, such as the series commemorating Caracalla's visit to Pergamum.

The whole of the fifth lecture was devoted to a review of the coinage of Rome. Copper was long the standard metal among the Romans, and the oldest coins were so large that they had to be cast, not struck. Silver was first minted by the State in 268 B.C., and gold not until the year after Julius Cæsar's death.

The military *imperium*, however, carried with it the right of striking money outside the city when the exigencies of a campaign might demand it. Thus Sulla minted gold and silver on a very extensive scale during his wars in Greece. His example was followed by Julius Cæsar, whose invasion of Italy produced a most curious situation. The constitutional authorities, as represented by the Senate, fled across the Adriatic with Pompeius, and such State currency as was issued was minted in the East. In the meantime Cæsar, having established himself in the capital, proceeded to strike gold and silver in virtue of his powers as *imperator*, powers which he had no title to retain when once he had entered the gates. On his recognition by the Senate he put the silver issues on a constitutional basis, but still minted gold. The political confusion that ensued upon his death was faithfully reflected in the currency. The right of mintage was exercised by quite a number of the leading combatants in the Civil War. When Augustus organised the principate, he dealt with the coinage in very characteristic fashion. Retaining in his own hands the striking of gold and silver, he conferred upon the Senate a monopoly of the copper and bronze issues, which were now resumed after an interval of some sixty years. This system lasted for three centuries, and only broke down under pressure of the persistent depreciation of the Imperial silver.

Proceeding to speak of the types, the lecturer pointed out that these could not fail to be, in the first instance, religious, seeing that the practice of issuing coins was borrowed from the Greeks at the very time when the religious influence held undisputed sway. The types of the Republican copper were uniform throughout its history, and the intense practicality of the Romans was illustrated not only by the prominence given to the marks of value, but also by the fact that a special deity was reserved for each denomination. The head of Janus was probably placed upon the *as* for the same reason that led to his name being bestowed on the first month of the year. We know that he was the god of all beginnings. The types of the silver denarius provide a story of very remarkable interest. At first they were uniform. About 154 B.C. the first symptoms of change betrayed themselves. Some twenty years later the moneyers began to make occasional use of types that alluded directly to their family history. Finally, the religious impulse yielded entirely to a revival of the commemorative one, so that during the last years of the Republican era the types became almost purely personal in their reference. Even contemporary events were not infrequently portrayed. Sulla's son, for example, employed a representation of the surrender of Jugurtha, a device, by the way, which his father had used for his signet ring. Mommsen has drawn attention to the manner in which the growth of the personal element in the types mirrors the course of political development at Rome. In this connection it is significant that the first living man whose portrait appeared on the State coinage was Julius Cæsar. This phenomenon is to be connected rather with his personal authority than with his deification. After his assassination, even the Liberators, always excepting Cassius, had coins minted bearing their own heads. This course was followed by Augustus, while the legend giving the name of the ruler was transferred to the obverse as a description title, thus completing the prototype of the coinages of modern monarchical countries.

On some of the reverse types of the transition period the commemorative tendency was so strongly marked that the coins were much like medals. A conspicuous instance was the denarius struck by Brutus with a reverse alluding to the murder of Cæsar. Under Augustus and his successors the same principle was actively at work, although now personal allusions had, of course, to centre round the Emperor and his family. During the Imperial age architectural types were more common than they had been

before, while personifications of qualities like Justice, Clemency and so on, were extraordinarily numerous. The actual choice of types was apparently still left to the individual moneyers. This policy inevitably led to flattery, which was more apparent in Rome itself than in the provinces. The lecture closed with a short discussion of the types of subsidiary mints, such as Alexandria and of Roman colonies.

The sixth and last lecture showed how at the close of the third century A.D. the triumph of the Roman coinage over the Greek was complete. As far as the arm of Rome could reach there was room for Roman money only. Although much of that money was actually struck in the provinces the mints that issued it were Imperial mints. The coins with the marks of London and Colchester, for instance, are as truly Roman as those that bear the mark of Rome itself. When the barriers of the Empire were finally broken down by the new nationalities that had so long been thundering at its gates, the Visigoths, Vandals and other "barbarian" peoples adopted many of the institutions of Roman government, including the monetary system. Their coins were for the most part mere imitations of Imperial pieces, retaining the emperor's head and the emperor's name. Even Odoacer, after his deposition of Augustulus, minted as the nominal vassal of the Eastern emperor. In the meantime there had been introduced among Roman types an element that was destined to have a profound influence. In the course of Constantine's reign the symbols of the Christian religion began to appear as heraldic devices—on the emperor's helmet or shield, on the labarum or Imperial standard, and so on. By-and-by they were employed as independent types. In spite of a temporary eclipse under Julian the Apostate, in whose reign the emblems of the Egyptian gods came into prominence, they grew steadily in popularity as a result of the increasing importance of Christianity as a social and political force. Regarding the types of the Western Empire there is little more of interest to be said.

In Byzantium it was otherwise. There, about the year 450 A.D., the figure of Christ was used for the first time on a coin. He took the place of the Pagan goddess Juno Pronuba in a group representing the marriage of the Empress Pulcheria to Marcian. The coin in question is known to us from a unique specimen now in the Hunterian Museum at Glasgow. This instance was an isolated one, explicable by the circumstances of the marriage, which was a spiritual one only. Rather more than two centuries later, however, the bust of Christ holding the gospels began to be used as an ordinary reverse type. This coincided with the development of image worship in the Christian Church, and it is significant that the same period saw the birth of the Mohammedan coinage, which eschewed all types as necessarily idolatrous. To this day orthodox Mohammedan coins have nothing but inscriptions. The advent of the "Iconoclasts" was marked by the disappearance of representations of Christ from the Imperial coins. After the Council of Constantinople had pronounced anathema on the image-breakers such representations were reintroduced, and were presently followed by pictures of the Virgin. Groups in which one or other of the saints occupied a leading place were frequent from the end of the eleventh century onwards. It was then, too, that the coin motto was fully developed, partly, no doubt, through rivalry with the coinage of Islam. During the last three or four hundred years of the Byzantine Empire the parallel between coins and seals was extraordinarily close. Returning to the West, the lecturer proceeded to show that, after the fall of the Western Empire, the imitative influence was supreme for two or three centuries. The Merovingian and other coinages were little better than barbarous imitations of the Roman. A new era was inaugurated by Charlemagne, who abandoned the gold standard which Europe had inherited from Rome, and struck a silver denarius. Metal, fabric and types were largely copied throughout the West almost immediately, while the striking of gold came to an end, the gold currency of Europe being provided by the Byzantine pieces, or "bezants," as they were called.

Very remarkable gold coins were minted by Frederick the Second, "The Wonder of the World," before 1250. But the real signal for the revival of gold money and for a general numismatic Renaissance was the issue at Florence in 1252 of the first gold florin. It was shown that, as in painting so in die-engraving, the artistic inspiration of the new age came from Constantinople. The two sides of the florin were then taken as illustrative of two of the leading motives that determined the choice of Mediæval coin-types,

the reappearance of heraldic devices, especially of "canting badges," being a striking feature. Somewhat later, and probably through the influence of the medal as treated by Pisano and others, came the revival of portraiture. The silver penny of David I., the gold noble of David II., and the bonnet piece of James V. were discussed as characteristic examples.

BUILDINGS FOR TECHNICAL CLASSES.

AN official memorandum has been prepared by the Board of Education respecting the planning of buildings for technical classes. It is as follows:—The conditions relating the planning and construction of buildings for accommodation of technical classes are much more varied than those affecting any other type of institution for educational purposes, so much so that any code of rules designed to be universally applicable to such buildings would either subject in nearly every case to exceptions required by the particular circumstances, or so meagre as to be of little practical guidance to managers. Hints may in certain cases be obtainable from the rules which the Board issues for other types of educational institutions, but inasmuch as each of these sets of rules has been framed with special regard to the requirements of schools or institutions of distinct and well-marked character, it would not be right to rely upon them in planning buildings for technical classes, whether in matters of principle or of detail.

A building of the nature of a technical institute should be designed with careful consideration of the special circumstances of the locality; for, while the number of students to be accommodated is a dominating factor in the problem presented to the managers, yet the design and the details of the building are greatly affected by differences in the organisation of the institution and in the nature of the instruction contemplated. In the largest centres of population it may be necessary to erect buildings which will afford special accommodation for advanced day classes connected with one or more important industries. The main purpose of the greater number of technical schools is, however, the provision of educational facilities in evening classes for students who are engaged during the day in technical or commercial pursuits, and this gives each school an individuality defined by features that might be roughly indicated under such heads as these:—

(a) The extent to which co-ordination with other evening schools makes it unnecessary that the technical institute should provide accommodation for students in the earlier stages of their technical education; (b) the sections into which the subjects of instruction naturally fall; (c) the relation of the numbers of students in one section to those in another; (d) the number of classes in the several sections and the frequency of class meetings; (e) any special provisions necessary in connection with particular local industries.

The circumstances and possibilities of the school in these matters affect not only the aggregate accommodation to be provided, and its distribution as to sections of work, but also the extent to which classrooms, lecture-rooms, laboratories, or other rooms for practical instruction in science or art or their applications can be restricted to their use to single subjects, and therefore the extent to which specialisation of the design and fittings of rooms will be justifiable.

It may be proper, in planning buildings for the purpose of technical classes, which, so far as can be foreseen, will probably be used for that purpose in the evening only, to consider whether there is any possibility that the building may be required to serve some other educational purpose in the daytime; but unless, as the result of such consideration, the latter purpose becomes avowedly paramount (in which case one or other of the sets of rules issued by the Board may be applicable), care should be taken not to allow the planning to be affected in such a way as to make the buildings less suitable for the technical classes, for which it is the managers' primary intention to make provision.

The experience of those who have had recent occasion to erect new buildings for technical institutes, or additions to existing buildings, shows that satisfactory results may be secured by arranging that the plans shall be prepared in accordance with an approximate statement of room dimensions accompanied by sufficient particulars as to the character of the several rooms. The compilation of such preliminary descriptive schedule implies a careful survey of the educational work to be carried on in the proposed building. It may with advantage follow upon an examination

recently erected buildings somewhat similar in size and action, for the experience of the use of one building frequently affords valuable suggestions or warning to those who about to plan another. Should a local education authority, or other body of managers, when contemplating the provision of further accommodation for technical classes, desire to consult the Board before the plans are drawn, the Board will be pleased to arrange that an officer whose educational experience has included the work of such an institution should confer, either at the office of the Board locally, with those to whom the duty of preparing the scheme of the building has been remitted.

Plans submitted to the Board for approval are subjected to technical examination in detail, those for each building being considered in relation to the educational needs of the area to be served. Should the plans appear to be defective or capable of improvement in any matter of construction or arrangement, suggestions are at once communicated to the managers so that any necessary action may be taken before tenders are invited.

ARCHITECTURE IN SCOTLAND.

THE architectural drawings in the Royal Scottish Academy, says the *Glasgow Herald*, are even fewer in number this year than formerly. Rejections may account for this to some extent, for the average of quality is high, if there be no works of first magnitude or importance. Executed buildings preponderate rather than projects, so photographic illustrations are plentiful. Still, in three cases at least of finished works representation by drawings is preferred. One misses the competitive designs of former displays, interesting in their way as showing how public architecture got; for not always does the official selection commend itself to outsiders. Whether the scarcity of drawings is to be laid to the account of the fewness of building projects or not, one at least, much canvassed, might have been exhibited, viz. an illustration of what is proposed for the new Hall.

To begin with an Associate's work, a notable addition to Edinburgh street architecture and of sufficient novelty to invite comment is the Professional and Civil Service Library Association, by Mr. John Jas. Burnet. This is a treatment of the Classic that accords with its surroundings, and yet is distinctive in its trace of French influence and many touches characteristic of and familiar to the architect. No shopkeeper can take exception to its large window surface for purposes of commerce, while its architectural effect is got by projecting eaves panelled on the underside. There are marble columns at the entrance, sculptured drums, and horizontal bands of coloured marble set in the wall. This is in addition to the usual architectural treatment that surrounds the shop windows. Mr. Cullen's Bank District Offices, Hamilton, of dignified Classic, has a good deal of originality in its details. It may be fitly compared with the Midlothian County Buildings, by Mr. Henry, shown by photograph of similar style, if more restrained, as befits its site and surroundings. The front to St. Andrew's is particularly satisfying, and the interiors are equally good; a plan is given. In the same style is the Archers' Hall, Entrance and Stair, and the Scottish Agricultural Club Entrance Hall, by Sir R. Rowand Anderson, photographs of works that affect one more by appropriateness than by any novelty. Ornament is absent, but it is not missed. The vaulted colonnade of the latter shows design in the planning as well as in wall space. Glasgow buildings are represented by the Edinburgh Life Assurance Office, now erecting in St. Vincent Street, by Mr. John A. Campbell, shown in a slight sketch; Messrs. Annan's new premises, Sauchiehall Street, by Messrs. Honeyman, Keppie & Macintosh, illustrated by a red geometric drawing.

Domestic work one or two Edinburgh architects have submitted. In Mr. Lorimer's case this is well maintained. Kerro, Forfarshire, a work surely after his own heart, the restoration and addition to an old Scottish mansion, the even extreme quaintness is allowable. A room set as a chapel (unusual nowadays, but common to the old) has its doorway very nicely treated with sculpture and pious inscription. Another of Mr. Lorimer's exhibits does not please so well—High Barn, Surrey. Whether this is really an old barn transmogrified or a new building in the garb of one the photograph does not show. Especially, beyond a tall narrow gable with Dutch-like curls, and aggressively bare; "the barn" is the drawing-room

affectedly simple. Queenshill, Kirkcudbrightshire, by Messrs. Leadbetter & Fairley, is better. It is in Scottish manner, rough-cast and stone dressings, with features recalling Falkland Palace without the towers. Carraig Thura, on Loch Awe, by Mr. G. P. K. Young, is in a similar manner, but with the masonry all exposed; the frontages are too much cut up. Ardlaggan, by Messrs. J. Jerdan & Son, is in Classic of a domestic kind, and it is pleasant to meet with the gable emphasised by the pediment cornice, the current vagary being to let the slates flush the wall. A frame of photographs of recent works by Mr. Henry F. Kerr is quiet and unobtrusive. House at Innerleithing, Messrs. Dunn & Findlay, is Scottish domestic in style, chiefly covered with rough-cast. A terrace in front with stone balustrade helps the general effect wonderfully. Photos of two country houses by Mr. T. D. Rhind. One has very bare posts at verandahs, the other has the interesting feature of modelled ornament in plaster on one of the gables.

Photographs of three houses by Mr. A. H. Crawford are all of them refined and good. Carlung, a reconstructed mansion in Ayrshire, by Messrs. Leadbetter & Fairley, is a design after the English manorial type. In this case the brick filling may be replaced by rough-cast. Gartmore House, by Mr. David Barclay, also a reconstruction, is in the Italian villa manner, but it is coarsely done; a photo and no plan. Red Tower, Helensburgh, by Mr. Leiper, R.S.A., a large house for Mr. James Allan, has many of the characteristics of the architect's work. Appropriately enough, the round tower that he is partial to is here, the great oriel that carries up to a polygonal-slatted roof, the bit of timberwork externally; while within there is much elaborately panelled wall dados and richly moulded plaster ceilings. St. James's U.F. Church, Kilmacoll, by the same, is shown in seven photographs. The novelty is the spire finish of French character; the phase of Gothic employed is English decorated, three-aisled in plan, with clerestories; all the stonework is exposed internally. The other churches illustrated are Pitcairn, by Mr. H. J. Blanc, R.S.A., which has a short tower with a spirelet covered with lead, in Perpendicular style; a pen and ink drawing; also in pen and ink is a U.F. Church at Bo'ness, by Scott & Campbell, with a slated spire and a corner turret, and Dundyvan Church, Coatbridge, by Mr. Alex. Cullen, with a crown spire and a happily placed hall that groups well with the church. These comprise the ecclesiastical work in buildings, but we must include rich interior woodwork at Coats Memorial and St. James's Church, Paisley, by Mr. Blanc.

Only two Libraries appear, at Whitehaven and Prestonpans, by Messrs. Greig Fairbairn & Macniven, both excellent, well expressing their purpose, and nicely shown by wash drawings. A School at Helensburgh, by Mr. A. N. Paterson, has less of the institutional look about it than too often attaches to Board buildings, being low and with outbuildings that help the grouping, with curved slated roofs of east country type: a fine architectural tinted drawing by the architect. Other coloured drawings, but not so good, are: Lady Colebrooke's Workshop and Field Court, Gray's Inn, too pictorially treated. The largest building shown is our Technical College in George Street, illustrated by a slightly tinted wash drawing. There is no plan, so one must judge only the façade. It is most disappointing architecture. Doubtless every window is required, but with balconies it would be easy to relieve the flat front without injury to light. It is very unfortunate that so fine an opportunity has been missed. A design for Wesleyan Halls, by Mr. James G. Dunn, has a nice treatment of Georgian brick and stone, shown in a good wash and pencil drawing. A memorial library at Glenalmond is by Mr. A. C. Heiton, and of interest, but the overhanging oriel over the doorway is not too happy. The interior of tea-rooms in Macvitties, Guest & Co.'s new premises in Princes Street, is an addition of note to the number of elaborately provided places of the kind. The restraint shown is commendable, for here if anywhere advertisement is permissible.

The Norfolk Education Committee have rejected the following motion:—"That in cases of alterations and additions to school buildings or houses not exceeding 500*l.*, it be an instruction to the architect employed not to supply bills of quantities, but that the competing builders prepare their tenders from an inspection of the plans and specifications, which should be open to inspection for a reasonable time before the date of receiving the tenders."

NOTES AND COMMENTS.

IN the Journal of the Society of Arts for the 31st ult., the Council publish a statement concerning the proposed amalgamation of the London Institution and the Society. A committee of both bodies drew up a report on the subject. It will be considered at the annual meeting of the Institution on April 28, and at the annual meeting of the Society on June 28. Counsel have advised that the least costly method of carrying out the amalgamation would be by obtaining an Act of Parliament. The Council of the Society of Arts consider that if properly carried out the union of the two institutions would "produce an institution of very great influence, and capable of carrying out public objects of the very greatest value." It is also said "that the union, if effected, would be an amalgamation of two powerful institutions, and not an absorption of one by the other. The objects of the two institutions are of so similar a nature, and their membership is of so closely allied a character, that there is little fear of any difficulty on this score, or any reason to apprehend that the objects which specially appeal to the members of either institution would be neglected in consequence of the overpowering influence of the other." The Society of Arts is the most disinterested of all the British societies, and the dissident members of the London Institution should remember that fact, and that the proposal for union has but one object, which is the welfare of the country.

THE late Sir NOEL PATON, the painter, sometimes represented knightly scenes in his pictures. He possessed a valuable collection of armour. It was lent to the Royal Scottish Museum for two years. So much interest was excited by it that Dr. DOBBIE obtained the approval of the Scottish Education Department to purchase the collection for 10,000*l*. The Treasury have agreed to advance a part of the purchase money if the balance can be raised by public subscriptions. Dr. DOBBIE's appeal has brought 1,000 guineas from the Corporation of Edinburgh, and contributions have been received from nearly all parts of Scotland. The Royal Scottish Academy is aiding, and there is no doubt this most interesting collection will be secured for the museum.

THE service which Professor LANTERI has rendered in teaching the sculptor's art at South Kensington during a quarter of a century was well deserving of the testimonial offered to him by his students. It consisted of a series of reproductions of works by HOLBEIN and ALFRED STEVENS, two artists who were not without some affinity in their style. A silver bowl was also presented to Madame LANTERI. Among the letters read was one from M. RODIN, who said:—"The teaching of Professor LANTERI, which I cannot praise as it deserves, is destined to bear fruit in the future by which England is bound to profit greatly. By his new method, by his strength and his precision, your professor has given to the teaching of sculpture a character far more important, richer in result and more fruitful than that which is possessed by ordinary methods of instruction." Signor LANTERI has so well performed his duties, it is to be hoped he will long hold his appointment. The modelling school of South Kensington has suffered in the past from the numerous changes of the teachers. Before one system was matured another was substituted, and the "character" which M. RODIN alludes to became an impossibility.

THE basilica of St. Michael, in Hildesheim, is one of the most interesting examples of German Romanesque. It is one of those selected by FERGUSON as an example of the style. It was founded by Bishop BERNWARD, who is renowned as an architect, painter and metal-worker, and was consecrated in 1033. It consists of a nave, two aisles and double transepts. The ceiling is flat, and on it are paintings of prophets and saints

which are supposed to date from the end of the twelfth century. FERGUSON remarks on "the elegance, both in proportion and detail, of the pier arches which separate the nave from the aisles; the proportion of the pillars is excellent, their capitals rich and beautiful, and every third pillar being replaced by a pier gives variety and apparent stability which is extremely pleasing." This noble church is now said to be in a dangerous condition. In order to obtain funds to insure its safety a society has been formed, and probably the money will be collected without delay. A building which has such a history should, however, be protected by the State.

THE County Councils are finding the designing of schools to be a perplexing problem. Most of the Lancashire districts disapprove of the scheme of appointing one architect for all schools, on the ground that the work to be done is beyond the capacity of a single man. In Essex the proposal is to appoint a consulting architect, with a salary of 400*l*., to supervise the plans of other architects, with 2½ per cent. in addition for any schools he may design. The subject is at present under consideration. In Durham what seems to be a similar system is adopted. The architect of the county education committee has been asked to prepare plans for schools at Neville's Cross and Langley Park. In addition, the following architects were selected for other schools:—Eaglescliffe, Mr. J. SANDERSON; Stockton; Crookhill, Mr. W. H. BENDLE; Newcastle; Cockton Hill, Mr. G. S. HOSKINS; Darlington; Southwick, Messrs. BROWN & SPAIN; Sunderland; Leeholme, Messrs. CLARK & MOSCROP; Darlington; Emmari Colliery, Messrs. BROWNE & BROWNE, Newcastle. No objection was raised to the arrangement because the process of selection was unknown, but after a discussion it was allowed to stand.

It is satisfactory to note that in the instructions issued to inspectors under the Irish Land Act which were issued this week, attention is given to architectural remains. Clause 23 states:—"Where any ancient monuments, including any ancient or Mediaeval structure, erection, or monument, or any remains thereof, which is a matter of public interest, or reason of historic, traditional, or artistic interest attaching thereto, exists on a holding or parcel of land in the estate, the inspector or surveyor should call special attention thereto, with a view to its preservation under Section 14 of the Act, if the same be considered desirable. This report should specify the nature and condition of the monument, and how it is at present situated and safeguarded.

It is not possible at present to realise the extent of the earthquake which appears to be still causing devastation in India. The accounts received must be exaggerated. But in the area which has suffered there are many great buildings, and their collapse would make Indian architecture less important than it is at present. It cannot be said that in the past sufficient attention was given by Englishmen to the remains of the varieties of Indian construction. Happily there is now a different spirit, and the destruction of the Taj Mahal, which is within the district where supernatural forces were active, would be felt as a national loss. Lahore, which has suffered, contains a multitude of buildings which have historic as well as artistic interest. But at present it cannot be determined how many have fallen.

BALFOUR PLACE, FROM SOUTH-WEST.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

MEETING of the Institute of Architects was held on Monday evening last. Mr. John Belcher, A.R.A., president, in the chair.

Mr. Alex. Graham (hon. secretary) announced the death of Mr. Frederick S. Waller, Fellow, elected 1856, who was placed on the list of Retired Fellows in 1900, and of the late Mr. Samuel J. Nicholl, Associate, elected 1847. Mr. J. W. SIMPSON read a paper on

The Planning of Cities and Public Spaces.

Referring to the literature on the subject, Mr. Simpson expressed his indebtedness to the works of Herr Stübben, of Cologne, and Herr Camillo Sitte, of Vienna, and remarked that the artistic side of city planning had been almost entirely neglected in England; our authorities, he supposed, do not even realise its existence. The laying out of new streets and roads is nowadays looked upon as purely technical engineering. It was not thus that the cities of the past were created which are still the wonder and delight of the modern world. The Greeks in the Acropolis, the Romans in the Forum, have given us a model for all time of the way to concentrate the forces at our disposal for the beautifying of a city. Contrast the effect of such places, enclosed by splendid edifices and adorned with countless masterpieces of plastic and architectural art, with the forlorn bronze figure stranded on its pedestal amid a tearing stream of traffic which represents the modern idea of a public monument. The "place" of the ægean and Renaissance times, the direct descendant of the antique Forum, has been entirely ignored in our modern city plans. Granted that modern conditions render the "place" no longer necessary as a common centre of change and commerce, yet we may do well to examine the fathers' work and save of the artistic heritage what can be adapted to our circumstances. Exhibiting on the screen plans of various ancient "places" in Italian, Greek, and Flemish cities, the author brought out that, in spite of their apparently aimless irregularity, they were in reality constructed upon definite principles. With a city must husband our resources if we are to obtain an artistic whole. If we scatter indiscriminately the material which makes for beauty (and for our purpose this material is represented by the public buildings and monuments) it is swallowed up in the general mass and fails of its effect. In the ancient "places" the statues, fountains, and other monuments were placed, not in the centre of the space, but at the sides. Fountains naturally should be placed beside the beaten trackway. As Donatello's fountain of Gattamelata and the little column stand at the side of the entrance of the church of St. Anthony of Padua, so obelisks and statues of the Pharaohs rose beside the entrances of the temples. The ancient churches in Italy were often engaged on one or more sides with other buildings, and the author gave several illustrations to show how he intended to produce those groups of open places which give such charm to the buildings. The enclosing of the old "place" was an important feature and a principal element of its charm. No mere open space between streets will give it—the appearance of an unbroken frame of buildings is essential. The author's illustrations made out two leading principles. First, the monuments being placed at the sides, the centre of the square is left free, and the place is enclosed by a continuous frame of buildings. The "place" must be proportionate in size and shape to the buildings to which it is to give value. Generally speaking, the space in front of a church or other vertical composition will be found to be deep, while that before a town or other building whose characteristic is length is usually shallow. The irregular plan of ancient "places," though not in accordance with our modern ideas of "symmetry," do not distress us in execution—they appear natural. The ancients did not trouble about theoretical symmetry, but realised in practice what actually caught the eye. The author directed special attention to the Signoria at Florence—from an architectural point of view the most remarkable square in the world. Its form and size, the disposition of its monuments and buildings, the way in which the streets deliver into it, are all admirably studied. Effort is apparent, and the superb composition is achieved without disturbing thoughts as to the causes of its beauty. Again, the plans of the Piazza di San Marco and the Piazzazzetta at Venice exemplify with the most refined art the principles deduced as to the placing of monuments, the form of the central space, the enclosed frame, the absence

of geometrical regularity, and the value given to squares by their combination with others of varying form and size.

Passing on to street planning, the author referred to the theoretical systems, rectangular, radiating or triangular, as being one and all devoid of artistic interest; nor did such a consideration enter the minds of the engineers who designed them. They had failed even to solve satisfactorily the practical problem of constructing the shortest route between any two points so as to save time in transit. In ancient towns nearly all side streets entered main thoroughfares at right angles. In the modern triangulated and radiated schemes acute angles were inevitable. Again, the ancients avoided as far as they could the delivery of several arteries of traffic at the same point. This principle was now quite neglected. Considering that the chief object of modern street planning is to save time in getting from one point to another, and not merely to construct the geometrically shortest routes between them, the author turned to the streets of Bruges and the fourteenth century in search of guiding principles, illustrating his points by the aid of diagrams. In the whole of Bruges there is hardly a street which formed an acute angle with another, nor a crossing of more than one street with one other. Where a street approached another obliquely or threatened a complicated intersection, its line would be curved so as to avoid acute angles and confusion. Again, the principle of framing the view by enclosing it and preventing distracting perspective is carried out with as delicate an art in the plans of ancient streets as in those of open "places." The more limited the impression the more complete is its effect was the sound axiom of art which, consciously or by tradition, guided the old street builders. There is no reason, either practical or artistic, why our streets should have monotonous parallel sides. The author took as an example the characteristic little "Rue de St. Armand" at Bruges. Not only is such a varying line picturesque and advantageous to the buildings, but it affords exactly those spaces for the cab-stands, telephone and fire-escape kiosks and other constantly increasing requirements which are difficult to provide for and cause obstructions in uniformly regular streets. Violent bends are not necessary; a slight curvature or displacement of the axis line will produce the happiest effects. The concave line of frontage is the most valuable in improving the appearance of a street, and it should be broken as little as need be. In conclusion the author asked, Is it hopeless to suppose that in time our authorities may perceive that mere pulling down, aligning and widening of streets will never meet our traffic requirements, and that what is needed is artistic and considered planning? To the Institute students especially he commended this problem. Let them not be content to continue by mere tradition the measurement and study of the individual building and its details, important though these be. There lies a rich reward for those who will consider the combination, construction and grouping by which effect is gained; and the R.I.B.A. prize committee might perhaps judiciously stimulate synthetic as well as analytic investigations.

Planning of the Streets and Public Spaces of London.

Professor BERESFORD PITE, contributing a second paper, said:—It must be manifest that counsels of perfection which originated and governed the planning of an architect's Utopia or of a garden city changed in value when the case was altered to the grim actuality of a modern city. Upon the superior commercial value of well-designed wide streets and grand public spaces, compared with ill-arranged and ineffective ones, there could be no doubt. The recent development of municipal organisations should create local interest in the larger aspects of street architecture and stimulate emulation between the boroughs. London was dotted over with picturesque elements which might be crystallised into characteristic and pleasing groups and arrangements. The author recalled typical centres of concentration of traffic and buildings which had each a character only definable by its local London name—e.g. Tower Hill, with its history, its artistic charm and dignity, its large freedom of space and openness to the river; Smithfield, with its splendidly characteristic markets, its ancient priory and great hospital, and the mysteriousness of its subterranean roadway; King's Cross, with its railway termini and restlessness and the ragged landscape of the Euston Road; Whitechapel, with its old haymarket width, the shambles and picturesquely situated church; St. George's Circus, finely planned

and occupying the natural centre of London, with the noble Bethlehem Hospital beautifully placed near by; the Elephant and Castle, Camberwell Green, Kennington Gate and the site of the new Lambeth town hall at Brixton were further examples to show that each district of London had opportunities for the conservation of the interest of public places and thoroughfares which were not far to seek for the exercise of local patriotism. The author pressed home to his audience the value of the latent and inherent qualities of London's local landscapes. Owing to the general lack of artificiality or of a formal arrangement of the many features of interest in London street architecture a character had been created which had artistic value, and, generally speaking, London was in no need of the services of a Baron Haussmann to straighten her out. A recognition of the peculiar elements of the city's landscapes would lead to that wise appreciation of liberty and of practicability which would not only save us from the personal annoyance of cherishing unattainable ideals, but would enable us to advise local authorities as to the conservation of those elements of interest and picturesqueness which were valuable. But the interest of London's planning and the laying-out of her public spaces was not only that of the smaller centres. Quoting Turner's remark that London without St. Paul's would not be London, the author referred not a little of the Englishman's sense of the dignity and sufficiency of his citizenship to the situation of the cathedral upon the outer sweep of the great river bend which revealed it to all who entered by the great waterway. In a very real sense the laying-out and planning of the city depended upon the sweep of the curves with which the river passed through London from the Palace of Greenwich to that of Fulham, and thus controlled the direction of the main thoroughfares on both banks from east to west. Englishmen were scarcely yet alive to the imperial grandeur of the Thames embankments, more worthy of admiration than any scheme of avenues or streets that the world at present held. Public buildings and national monuments could be more splendidly placed upon the banks of a broad river than on any other class of site, and London, without the enormous expense of forming new roadways and clearing thickly occupied areas for the purpose, was in possession upon the Thames of a series of situations for grand buildings which should awaken the public conscience to the existence of the delights architecture had the power to reveal. Speaking of the bridges of London, the two distinct aspects of a bridge design were, first, that of its width, proportion and gradient as a thoroughfare viewed from above; secondly, that of its elevation viewed from below. When the necessary new bridge at the Temple appeared, may it be as fine as Westminster from above and as beautiful as Waterloo from beneath. It would occupy a majestic site in the grand curve of the Embankment, so that its perspective would grow and radiate as it was approached, and with Somerset House between it and Waterloo Bridge, and the great Embankment below, a subject would be created not unworthy of some new English Piranesi. It was to be hoped that the fashion for bringing steam railways into cities would soon be over, and that invisible tubes would supply all the needs of rapid urban locomotion, while proper masonry bridges would replace the temporary and rusted-out toys of a past century for the accommodation of the now triumphant autocar across the Thames. It was too late to lament the presence of the Thames railway bridges, but how fine a series of the termini of the three great southern lines, such as those which lay on the north of Euston and Marylebone Roads, would have been on the opposite bank, each approached by a fine passenger bridge from the City shore. What a saving of time in locomotion, the railway managers being saved the problems of bridge crossing. What a saving to the companies in the cost of City sites for the termini would not this reform have effected, and above all, what an addition of architectural interest and beauty to the river in place of the marring the railways had effected. Referring to Regent Street, he argued that it was inevitable that the course of nearly a century should make inroads upon the completeness of any human scheme, and it was fruitless to deplore the necessary alterations which renewed the face of progressive cities periodically. Regent Street, however, had a special claim to be considered as a whole, for it was such. Its characteristic was harmonious completeness, with a sustained variety in its consistency which was doubtless the unexplained secret of its pleasantness. The

whole street had been laid out and built with a regal of dignified discipline, and it remained the property Crown. It was, therefore, greatly to be regretted that latterly rebuilding had been permitted to take place as if the street had no harmony to be broken or character of its own. Architects could not forget the perfect works of Professor Cockerell, one of the most and innocently projected over the footway, and the full towers at the curved approach to Regent Street. Nor could they but regard the reasons urged for removal as being entirely insufficient, or find for their grief in the contrast to all its architectural virtues which now vauntingly occupied its site the eastern side of the street the harmony had rudely disturbed as to architecture and scale by modern intrusions which it was only necessary to characterise as extraordinary instances of the blindness of reasonable authority to artistic facts. In view of the enormous labour and extent of the inception and accomplishment of the design of Regent Street, and of its value to London as a whole, it was not in sober truth too much to ask reasons avail for not undertaking the modification or reconstruction of the recent monstrosities. Indeed, a complete design for preserving the proportions and character of the whole of this fine thoroughfare needs to be taken in hand, in order that the inevitable effects of the shortening tenures under the original leases in rebuilding may be met without reducing the street to such a wreath as its former self as has been achieved at Piccadilly Circus. The lower portion of Regent Street and Waterloo Place itself were in some danger of falling a prey to piecemeal rebuildings without unity of treatment as to proportions. Londoners had expended some Philistine wit upon the Crimea Memorial, but no one could deny the fineness of its monumental scale and the harmonious but quiet detail of Waterloo Place itself. Was this also to be sacrificed in the removal of St. Philip's Church, Regent Street? Had been deprived of another refined and interesting front view and the proportions of the adjoining blocks. What would follow on its site? Piccadilly Circus was referred to as a painful example of how in decadent times primeval disregard of order reassessed itself. The revelation of the latter art of the nineteenth century was surprised by the Pavilion and the vista of Shaftesbury Avenue, enshrining as a jewel in a swine's snout Gilbert's fountain, and by the comedy granite dome of the Strand Board of Works' convenience, presented altogether a contrast to the Quadrant, the County Fire Office and the remains of the design of the Circus that cried aloud for remedy. This absurd accumulation of mistakes should be courageously handled and removed. The fear of the cost and the false economy in laying out Shaftesbury Avenue and the resulting sites had spoilt Piccadilly Circus, dismembered Regent Street, but there were capabilities in the ruins for renewing something of the complete scheme which had been lost and of providing a public space there of which we need no longer be grieved and ashamed. Whitehall and Parliament Square were decidedly growing in architectural interest and picturesqueness. The placing of great formal buildings upon a thoroughfare having a slight general curve and a variation in width was producing in the former its charming effects; while the interest of the Abbey flanked by the Houses of Parliament and St. Margaret's Church was a valuable foil to its neighbours, increased by contrast with the very different buildings at the northern side, and it was still a frontage waiting for some able designer to treat worthily before the western side behind the Canning Street. The placing of the finer classical buildings that London possessed upon informal and somewhat random surroundings was worthy of remark. St. Paul's would not be removed by removal from the wonderful piling up of buildings and spires which grouped with it on its approach from Fleet Street through Ludgate Circus, and the Royal Exchange without its pell-mell of omnibuses, and the accidental appearance of the Mansion House or shy retirement of the Bank into the background, would not be in London at all. The success and character of London street planning would appear to depend upon the provision of a building upon a site and in surroundings that were architecturally ideal, the natural tendency to picturesqueness in a crowded city making amends by artistic accident for the lack of rule and restriction required in its surroundings. At South Kensington a whole modern

of great and costly buildings had recently sprung on roads of magnificent width, without any such effect as could without much difficulty have been obtained with the gardens on the north, Cromwell on the south, and Queen's and Prince's Gates west and east. The buildings include the costly and wonderful Albert Memorial, the Albert Hall, Imperial Institute, Natural History and Victoria and Albert Museums—which are of the first magnitude—and the two Colleges of Science, the City and Guilds Institute, the College of Music and the others were of impressive size. The estate, however, had been futilely subdivided by two cross roads, practically accommodating only two buildings apiece, and the rest were on the outskirts facing the surrounding stucco mansions. No earthly view of this fine accumulation of first-modern buildings was practicable. Turning eastwards on the Strand one found a great problem courageously posed and originated, but waiting for its fate at the hands of the builders. Could a street of such a width as 100 feet be the sites and conditions were in character and in keeping with its breadth on one side of the street only? The difficulties would vanish if the providence of proportions in Regent Street were adopted here, and the scale would have value, not only to the two lovely churches and to the Somerset House, but a healthy freedom for light and air in the central block of London atmosphere. The author concluded that the consideration of the subject before them led naturally to look to the exercise of authority as necessary in all streets and public spaces laid out on rational and symmetrical principles, for the preservation of the character of the whole, and for the prevention of assertive individualism to the detriment of general unity. Such authority could be most readily afforded by the County Council, probably acting through an architectural committee of advice, whose judgment could be allowed to ride upon the cases where the public interest demanded regularity of treatment or otherwise. The widening of thoroughfares that had become main routes was expensive and difficult, but the Institute, he hoped, would throw its influence in the path of measures which must issue in an increase of public amenity and health, and would not be deterred by the difficult questions of rights of property connected with frontage lines to narrow or limit its sympathy with the wishes of the London County Council to widen, open and improve for all architectural purposes the streets that should be transformed into dignified thoroughfares. The proposals in the Draft Amendment Bill, now withdrawn, to increase the width of new streets and, when expedient in the public interest, to widen streets up to 150 feet, were surely considered with a regard for architectural effect that was of the highest value, and which must command the support of every lover of London.

Mr. G. M. FREEMAN, K.C., in proposing a vote of thanks to the authors of the two papers, said he entirely agreed with Professor Pite's suggestion that London had an advantage which perhaps no city in the world in a comparative sense possessed, and that was the great waterway of the Thames flowing through it. The papers had divided themselves into two great questions, the first dealing with the regulation of the individual buildings, and the second on suggesting how the streets should be regulated. It was evident that regulations in these matters were necessary, especially under the present condition of things they could have a street of excellent proportion spoiled by the erection of buildings quite incongruous to it. It would be possible to remedy this by having all the property made State property and by the framing of such building regulations as would compel people to keep their buildings to certain heights. There would still be difficulties, however, to a good general scheme, because the design of the buildings could not be controlled. Then there was another matter, the disinterestedness of the public and Parliament in aesthetics. The bridges built by railway companies afforded examples of the general lack of taste. There was only one practical way of treating the question, and that was for artists, sculptors and architects to be represented on those bodies that controlled the affairs. The spirit of commercialism and vulgarity was universal. All large continental cities suffered in the way that we did, and in such places as Milan, Florence, Venice, possessing the most perfect and beautiful examples of architecture and street arrangement, they had that in modern work the barrack-like style of domestic buildings predominated. The remedy rested with the profession. In the constitution of old Governments they found the artists and architects were municipal men who took an active part in the control of the affairs of State. But

nowadays it seemed that people with light and learning, who could render valuable assistance in such questions, did not seek public service. Until, therefore, the artistic professions came forward to give their counsel in that which concerned beauty and taste the epidemic of vulgarity would continue.

Mr. WALTER CRANE, who seconded the vote of thanks, agreed with the last speaker that the only way to get reform in municipal councils in an artistic sense was to get artists and architects represented on those bodies. The tendency of the times was against true architecture, so that he believed any success that might reward their efforts would be the result of accident. The beauty of London was really destroyed by its suburbs. The city in itself did not lack merit, but as in many continental places the outskirts and suburbs as approaches marred the effect of the capital.

Captain HEMPHILL, L.C.C., said it would be well if the Institute understood the view in which the County Council approached such subjects. The County Council were in a difficult position, because they had to consider the public, who were not struck with that feeling towards art which dominated the meeting. In all its proposals the County Council had endeavoured to get assistance and advice from those who were able to give it. They had been condemned about the widening of the Strand for not putting the frontage back. The difficulty was that the scheme submitted to the Council would have cost 300,000*l.*, and they felt they were not justified in spending such a large sum of money. The County Council did not pretend to be entirely artistic or scientific, and he thought they would welcome such assistance as a committee of architects could give in matters relating to building. The Council in the proposed new Building Act which had been withdrawn did not claim that they knew everything; on the contrary, they asked advice, and yet the Act had rendered a great service to London. In reference to the papers, he said he felt that desirable as the pictures of ancient places might be, it was somewhat doubtful if the old arrangements would meet with the conditions of modern requirements, and in London they were concerned with the present and improvements for the future.

Mr. H. V. LANCHESTER supported the vote of thanks to the authors of the papers.

The PRESIDENT, in summarising the discussion, referred to the changes that were being made in Regent Street. The alterations were to be regretted, but the matter, he said, was under consideration by the Crown officials, and it was very probable that there would not be a recurrence of the blunders that had lately been committed. Piccadilly Circus was also receiving attention, and he hoped a satisfactory scheme would be planned and eventually carried out.

SCOTTISH NATIONAL GALLERY.

AT the present time, when the question of the future of the National Gallery of Scotland is occupying attention in art and other circles, it is pleasing to be able to report, says the *Scotsman*, the gift of three important pictures to the gallery by two prominent Edinburgh citizens. It has always been matter of surprise that more pictures have not come to the gallery, especially by bequest. An idea seems to have prevailed that there was no more room for pictures on the walls; but, restricted as the space undoubtedly is, it is wonderful how the curator can always find a place for a really good work of art. This, however, is said without prejudice to the established fact that more accommodation is urgently needed for the National Gallery. In this case the gifts about to be mentioned are all the more acceptable inasmuch as they are made in the lifetime of the donors. The first to be noticed is a picture in oil by the late Erskine Nicol, R.S.A., A.R.A., which has been presented by Sir A. Oliver Riddell, Craiglockhart House, Slateford. It is entitled "An Irish Emigrant Landing at Liverpool." The measurements of the canvas are 4 feet 8 inches (upright) by 3 feet 5 inches, and the work is undoubtedly a very important example of the art of Mr. Nicol, and will be hailed with much satisfaction by those who wish to see a good collection of Scottish pictures built up in the Scottish National Gallery. In the Irishman who has just landed on a quay at Liverpool will be recognised Mr. Nicol's well-known model, Jim Blake, who figures in a good many of his Irish pictures. He is here a stalwart, picturesque figure, attired in tall hat of wonderful shape, ragged frock

coat, reddish vest and dull yellow trousers. He carries a bag over his right shoulder and holds a walking cane in his left hand. He is just having his first contact with English civilisation, for a bootblack has accosted him to ask if he wants to have his boots polished. At the question the Irishman has pulled himself up in a grandly independent manner. A roguish youngster, attracted by the quaint figure of the emigrant, is running up to see the fun. There are other points of interest in the picture. On the left, a little behind the emigrant, is an Irish girl, evidently in distress, who is having a bill explained to her by a swarthy sailor, and on the right, on the quay, is another group. The shipping stretches away in fine perspective, under a pleasing sky. The picture is altogether admirably painted in suave, luminous colours, and the details have been treated with the utmost care without in any way detracting from the interest of the central figure.

Two "kit-cat" portraits of much interest have been presented by Mr. Arthur Sanderson. They are by George Watson, the first president of the Royal Scottish Academy, and represent himself and his wife. There is a portrait of Watson in the portrait gallery and another in the library of the Royal Scottish Academy, but this work is allowed to be finer than either of the other two. The face of the first President of the Academy has a general resemblance to that of Sir Walter Scott, though the head is not so massive. The head of the portrait, with short cropped hair and glossy forehead, with white loose collar underneath the chin, stands out in fine relief against a dark background. There is more colour in the portrait of his wife, a buxom matron in black, with white goffered cap and ruffle, and wearing a deep red shawl, which is grasped at the left side by the right hand. There have also been bequeathed to the gallery three interesting drawings—two by Paul Sandby, R.A., one of the early English water-colourists, giving different views of Bothwell Castle, one dated 1770; and an architectural design by Thomas Sandby. These drawings have been gifted by the representatives of these two early artists.

Then there have been purchased by the fine art committee of the Board of Manufactures for the Gallery a small but exceedingly fine example of the art of the late Paul Chalmers, R.S.A., called "A Quiet Cup"—an old woman enjoying a cup of tea—as also a marble bust of Allan Ramsay, the painter, which was modelled from life in Rome by M. Foye. The pedigree of this bust has been well traced. When the painter died it came into the possession of his son, General Ramsay, and in turn passed to Lord Henderland and to Lord and Lady Murray. Subsequently it became the property of Mr. Lockhart Thomson, at whose sale the bust was purchased. A small wooded landscape by the Rev. John Thomson, of Duddingston, which was seen at the last Raeburn exhibition, and then very much admired, has also been acquired for the Gallery, the sum paid for the three works just mentioned being 107*l*. These new works have not yet been placed in the Gallery, but will be as soon as possible. There has also been offered on loan for exhibition by Mrs. Dott, Colinton, and accepted, a strong study of a Jewish head by Josef Israels, for his picture entitled "A Son of God's People."

WEST COUNTRY SCREENS AND ROOD-LOFTS.*

IN introducing the subject of West Country screens and rood-lofts, a few preliminary remarks upon screenwork in its more general aspect may not be out of place.

The chancel screen is a feature common to Christian churches of all lands and times, but whereas in some countries it is exceptional in its occurrence, in Britain it is very frequently met with, and would appear to have been well-nigh universal in former days, forming one of the most essential features of the English parish church.

In spite of the ravages of time, fire, iconoclastic zeal, and last—but not least in its destructiveness—nineteenth-century "improvements" and "restorations," it is estimated that there yet remain some 2,000 screens or parts of screens in our churches, and of these the West Country furnishes a large proportion, Devonshire alone contributing nearly 200 (some of course mere fragments) and Somerset about half that number. This abundance of screenwork seems to be traceable to the strength of Oriental influence in the early British Church, which laid the foundation of many pecu-

liarities of plan and arrangement that differentiate churches from their continental neighbours.

The earliest church builders appear to have been influenced by Hebrew tradition, and to have based plans upon that of the Jewish Temple, with its tridivisions separated by veils, and we find the use of veils and of screens as a substitute for veils, perpetual only in the Eastern churches of later times, but in the Celtic and Mediæval churches in these islands. Early writers testify to the fact that in the Celtic church a solid stone barrier was built between nave and chancel.

The churches of those days were not stone built, but were of wood or wattle, and it would appear like wickerwork was largely used in the construction of the lighter parts, as, for example, partitions and screens. The many remains of Celtic ornament or decorative work as applied to stone seem to suggest this, as they show representations of twisted or plaited work, interlaced and tendrils, &c., and in some cases these are elaborated into patterns very similar to those we find in the Country wood detail of a far later date.

The west and south-west of Britain were the strongholds of the Celtic race after the Saxon invasion, and in these districts the older Church and its traditions were not completely uprooted as in other parts—consequently we may expect to find that local types of church building of decorative detail would exhibit their characteristic features. In addition to this, the native stone of the West—in Cornwall and Devon—was chiefly of a rough and incapable nature, incapable of being wrought into fine forms by the mason or carver. Hence in these districts the stone art was not brought to so great a pitch of excellence as elsewhere, and it naturally follows that more attention was lavished upon the woodwork.

We may thus discern two reasons for the preponderance and excellence of the West Country woodwork of which the Mediæval screens and rood-lofts furnish the choicest examples, these having been from the first objects of especial regard and veneration, towards the beautifying of which every effort was made.

Parallel instances may be found in Brittany, where we exist a number of fine screens having features in common with the West British, the same conditions as to race and soil here holding good.

Saxon and Norman building traditions are chiefly concerned with the mason's art, and there appears little character of the decorative detail they employed to suggest a derivation from wickerwork or tendril forms; but in spite of the powerful influence of the style introduced by the Romanesque builders, the oldest British forms of ideas seem to have held their ground and gradually leavened the whole of our national Church architecture, giving a peculiar type of plan in which the high chancel screen is universal, screenwork of wood or stone being found in every part of England, but nowhere more abundantly than in the western districts.

There was a type of stone-built church common in Britain in early days, in which a solid barrier of masonry was built between nave and chancel. This was pierced by a single opening, not much wider than an ordinary doorway. In this we seem to discern the prototype of the heavy stone screens which are occasionally found in the country churches. Stone screens are, however, of unusual occurrence in the West of England, though they are found in certain localities as North Wilts and South Wilts. Some of these are of early date, and were originally designed as screens supporting a gallery over, thus forming the type of rood-loft as associated with the parish church.

One perfect specimen of this order remains at Compton Bassett, Wilts. The eastern member, forming the screen proper, consists of a wall with central doorway and traceried sidelights, below which altars formerly stood. To the westward is an open screen of three arches, highly enriched with sculpture and ornamental mouldings. A parallel instance is found at Le Folgöet, Brittany, which shows the altars, missing at Compton, but here in the ancient and customary position.

Of this arrangement of altars we have an instance at Patrício, in Monmouthshire, but here the screen itself is of wood, and is only a single screen. But the type of chancel most common in the West had no stone-built chancel screen such as that other early type I mentioned, but was a parallelogram of uniform width and height from end to end, without any internal break, so far as the masonry concerned. The roof, undivided by any chancel arch, ran clear from end to end, but the confines of the nave

* A paper read by Mr. F. Bligh Bond, F.R.I.B.A., at the meeting of the Applied Art Section of the Society of Arts.

cel were clearly marked off by the closely-traceried screen which crossed the church at this point. This arrangement is well seen at Llanegryn.

The abundance of wood screens in the West is very noticeable, and both in Wales and in Devonshire, districts containing them in large numbers, they are associated with the type of church above described.

Those which survive are chiefly of the fifteenth or sixteenth centuries, two causes having operated to reduce the amount of earlier work.

In the first place, natural decay; in the second place, the removal of the earlier screens for the more extensive and complex structures of later times. The latter fact was proved and commented on by the late G. E. Street.

The very general rebuilding of West Country churches, their enlargement by the addition of aisles in the sixteenth century, also accounts in a great measure for the disappearance of earlier work. This is notably the case in Devon and in Somerset, in which counties we may nevertheless find still a few excellent specimens of wood screening prior in date to the fifteenth century. That at Combe, in Devon, may be considered very early. It is simple and rough in execution. The parclose at Ottery Mary are of massive fourteenth-century type, also the screen at Mere, in Wilts (not the present rood-screen).

Later we find screens such as those now arranged as a screen in the church at Bridgwater, in which the work is of a massive type, exhibiting features akin to stonework in detail. Wood detail begins as an imitation of stone, in its earlier periods is extremely massive, comparatively coarse in execution, though sometimes wonderfully carved after the manner of freestone, but gradually we find it exhibiting more refinement of character and skill in execution, the design becoming more easy and natural, and proportions lighter and more closely adapted to the nature of the material and expressive of its qualities. We can distinguish this progress in viewing the detail of the parclose screens at Halberton, and the chantry screen now standing in the south transept at Dunster.

In the period of mature design which we are now reaching, it may be claimed that there is a very perfect intimate correspondence between the character and detail of the West Country woodwork and the nature of the material in which it is wrought, there being a virility and force in the design and a "verve" in the execution which are highly suggestive of the vigour of living forms, and have before great interest and value to the artist or art student. This quality is by no means so well developed in other parts or parts of England, where the detail is too often slavishly imitative of stonework, and exhibits a comparative meanness and poverty of design, features of a harsh character and possessing little interest, such as buttresses, ornaments, water tables and others of a like order, which are proper to stonework, being reproduced on a minute or unbalanced scale, with much repetition. These features are too often to give a hard and mechanical feeling to woodwork, a feeling which is increased when the mouldings employed are hollow or angular, but which can be greatly modified by judicious use of foliage forms and enrichments.

The West Country work is distinguished not only by the absence to a large extent of these mechanical and imitative details, but also by the universal employment of convex mouldings, beads or ogees, which are destructive of any tendency to harshness of effect, and bold convex profiles in scrolls and vignette enrichments.

But in the earlier woodwork some imitation of stone is to be expected, seeing that the arts of joinery and woodwork were in process of development in England during the thirteenth and fourteenth centuries, and only reached their climax in the early fifteenth century, after the period in which stonework had attained its best development.

We may now turn to the form of the earlier screens. Most of the wood screens of the fourteenth century would appear to have supported a loft or gallery to the westward, or usually over the screen. The screens themselves have frontal framed heads and the loft would have had a flat

There are several such early screens in Devon—as at Combe, Braunton, Budleigh, &c. That at Stoke-in-the-Head is said to date from Richard II.'s reign, and until its restoration it supported a narrow gallery. The little screen at Culbone probably upheld a similar gallery, and there are others of these square-headed early screens in Somerset, at Pawlett and Huish Episcopi, the latter said to have been removed from Enmore, whilst the northern part of the county is full of screens or remains of screens of a

peculiar and, I think, later type, of which Priddy, Wellow or West Pennard churches afford examples. These consist of a number of narrow vertical divisions having narrow lights, square-headed and containing tracery with crocketed canopy heads to the lights.

The galleries over the screens of this class were probably raised upon a coved soffit, as we see at Christian Malford, Ashchurch and elsewhere.

In Wales we meet with many screens of the Llanegryn type, carrying wide lofts with flat soffits placed centrally over them, and sometimes supported, as at Llanwnnog, by legs at front and back. Next comes a more elaborate type, which has arcading within a square head, as at Exbourne and Bow in Devon, and Keynsham, Ashton and Wrington in Somerset, and in these the loft in most cases stood centrally over the screen supported by coving back and front. Lastly come the magnificent groined screens for which Devon is so famous, and these mark the climax of the art. The development of the groining compares very favourably with any specimen to be found in other parts of England, or with foreign screens; and the character of the ornamental detail, especially the vignette enrichments in the cornice, leaves little to be desired in point of excellence of design and execution.

The screens in the West Country are usually of great width, frequently being continued across nave and aisles from north wall to south wall, whilst there is every evidence that the rood-lofts ran the whole length of the same. The screens generally exhibit a series of fenestrations with arched heads, subdivided by moulded standards supporting a close reticulated head of Perpendicular tracery, and between these spring groinings of hexagonal section, with moulded ribs and embossed or traceried fillings. Above these comes the beam which carried three or four tiers of vignette enrichment, divided by plain or twisted beads, and enriched by crestings at top and bottom, a choice and often highly ingenious design.

It is interesting to trace the types ruling in the different localities of the West Country, as these exhibit some totally distinct schools of design. Those of Devonshire were roughly classified by the author of this paper in the Devonshire Association Transactions for 1903.

There are several leading types of work purely English in character, of which those of Kenton, Kentisbere and Hartland may be singled out as representative specimens, whilst at Swymbridge and Bridford we find a highly enriched variety, literally encrusted with carving, and differing widely in detail from the usual type. Somerset gives us a series of great dignity and distinction of character in the tall transomed screens at High Ham, Queen Camel, Mere and others, whilst occasionally, as at Fitzhead, we find a screen entirely unique.

There are also a large number of screens, chiefly, I think, of late date, in which foreign detail is conspicuous, and in some of these there seems to be actual foreign workmanship. In the case of Kenton there is a screen of which the whole framework and most of the detail are English, while small portions betray a Flemish character.

Italian detail is found at Marwood, Atherington and elsewhere in the fillings of the groining, whilst at Aveton Giffard and Kingsbridge we have a French type.

There is a group of screens in Mid-Devon, at Colebrooke, Coleridge and Brushford, which have a character akin to the French Flamboyant, but with a curious Moorish or Oriental feeling about them. The tracery is subdivided, there being a main order of flowing or reticulated design, filled with a minute fretwork of similar form. A screen at St. Fiacre, in Brittany, exhibits detail closely analogous to these.

The English fifteenth-century type conforms to the Perpendicular, but in some late cases there is a tendency to a debased Decorated type of tracery, with detail coarse and ill executed. This appears in the parclose screens at South Milton and West Alvington, both, I think, very late work. The Cornish work partakes of this nature, the tracery of the St. Buryan screen showing it; also that at St. Ewe. Unfortunately, Cornish screenwork has mostly disappeared as the result of nineteenth-century vandalism.

The gallery fronts which surmounted the beam were of extremely rich design, and on them resources of the wood-carvers, painters and gilders' crafts were expended, producing an effect of great magnificence.

The usual arrangement seems to have consisted of a series of panels, sometimes pierced with tracery, sometimes embossed, but for the most part painted with figures of saints or Scripture subjects; those in Devon-

shire following as their prototype the jubé in Exeter Cathedral, which exhibits a series of Old and New Testament subjects. These panels would be surmounted by canopy heads of the finest tabernacle work and divided enriched standards, as we see in the old gallery at Atherington and restored rood-loft of Kenton or Staverton. At the top there would be a running ornament with a tall cresting over it.

These paintings would have afforded a valuable means of instruction for the unlettered rustics of former times, and have been termed "The Poor Man's Bible."

Much fine work remains in Wales where the rood-lofts have survived in many cases and exhibit some remarkable detail. Those at Llanegryn (east side), Llanwrog and Llangwm are typical specimens, having pierced traceried panels. Few remains of rood-lofts exist in Devonshire at the present date. Atherington, the best preserved, retains both balcony fronts, nothing having disappeared but the statuary or original paintings, which have been replaced by heraldry, scrolls and inscriptions of Elizabethan date.

Another at Marwood was taken down within living memory and several more are known to have been standing at no very distant date. The balcony over the eastern side is still standing, however, and is a quaint and curious piece of work, evidently of late date, the panels being filled with rudely-carved grotesques.

The rood-lofts which, prior to the Reformation period, had been employed for numerous purposes, mostly of a nature afterwards judged to be superstitious, appear, nevertheless, to have fulfilled a special function of more lasting importance in providing accommodation for choir and organist, with perhaps other musicians.

In this use they were frequently confirmed, it would appear, after the Reformation, being extensively used for the purpose, and no doubt many only disappeared because they were worn out. The order of Archbishop Parker that the rood-loft fronts should be taken down as far as the beam and finished with a convenient cresting was generally, but by no means universally, complied with, and this was especially the case in Devonshire, where a great many were retained as singing galleries or pews, as at Tiverton, Culmpton and Totnes, whilst others were simply removed to the west end of the church. It has been considered that the order for their removal was not aimed at the lofts as lofts, so much as at those superstitious accessories which were often a part of their structure, and thus necessitated in many cases the demolition of the entire fronts.

It seems odd that whilst the paintings or sculptures over the screen fell under such complete condemnation in Edward VI.'s and Elizabeth's time, the figure-paintings which adorned the lower panels of the screens were not ordered to be destroyed. Such mutilation as they have received appears to have been chiefly at the hands of the Puritans, and many series of such figures yet remain in Devonshire, as well as East Anglia, to gladden the heart of the antiquary. These paintings have been ably and exhaustively dealt with by Mr. C. E. Keyser, F.S.A. ("Archæologia," vol. lvi. 1898).

There was a strict injunction that the screens themselves were in all cases to be retained, and we find that not only were they not destroyed at the Reformation, but a great many were erected during the Reformation period, and subsequently these may be classed in order of date as the sixteenth, seventeenth and eighteenth-century types, illustrations of which are given in the screens at Lustleigh, Rodney Stoke, Washfield, Low Ham and Cruwys-Morchard. The screen at Lustleigh shows the Gothic traditions in its general form and detail, but with altered features according to Reformation ideas, figures of choristers and clergy being substituted for saints on the lower panels. That at Washfield illustrates the Jacobean type, in which a greater departure from old models is of course noticeable. In the screen at Rodney Stoke we see the effect of the revival of Catholic ideas under Archbishop Laud, there being here a post-Reformation loft above a screen of the same date. Other fine types of post-Reformation screenwork may be seen at Croscombe, Crowcombe and Bridgwater.

The attempt to reproduce some of the characters of fifteenth-century enrichment is noticeable in the cornices, but the immense difference is apparent, the seventeenth-century imitation being flat, coarse and superficial, and yet having a by no means ineffective character. It illustrates, however, the great decadence in the native arts since the days of the Tudors.

The example from Low Ham is even more interesting, as here is a church with internal fittings complete in

Caroline Gothic. The screen is well worthy of study. Cruwys-Morchard we see one of the instances—number—of a screen with parclose, stalls, &c., erected in the Hanoverian period. This was an age of apathy for Church matters when old landmarks were in process of being forgotten, and although such instances as this are a continuity of old tradition, yet, as far as the characteristics of West Country screenwork are concerned, work cannot claim to be a successor, as it is purely in design.

The West Country type of church having as a feature a chancel arch, its place was usually taken by a parclose extending from above the screen to the apex of the chancel. There are good ancient instances of this at Bettws-Negon and at Mitcheldean, whilst Littleham (Bideford) presents a modern one. This may be called a tympanum over the screen. On this it was customary to depict the Doom against it or in front of it, on the western side, would be the Holy Rood with figures of St. Mary and St. John.

At the Reformation these tympana were despoiled of their superstitious paintings and their surfaces were washed or plastered, and the Tables of the Law, with the Royal Arms, the Creed, and the Lord's Prayer attached to them in accordance with the decree of 1604. It is to be regretted that during the earlier "Restoration" period of the nineteenth century the greater part of these were removed, being considered an obstruction by the clergy of those days who had lost sight of the old traditions and failed to see the necessity of a barrier between nave and chancel. Much mischief also has been done by the hasty and unjudicious repair of screens, and to save the cost of restoration they have frequently been cleared of their ornamental detail. Sufficient nevertheless remains to form an accurate storehouse of the greatest value, and it needs but a careful and attentive study of the West Country screenwork to demonstrate its very high importance to those who are seeking to revive those beautiful handicrafts which were the pride and joy of our forefathers, but which have since fallen so lamentably into abeyance.

In these beautiful compositions we find a richness of variety which cannot fail to satisfy, combined with a remarkable honesty of design, and all the freedom from affectation which differentiates a native from a borrowed style. They remind us of those ineradicable principles in art which connect the form and proportions of a design with the nature of the material in which it is wrought, and regulate character in truth, fitness and harmony, offering in these respects, it may be feared, a rather painful contrast with much that unfortunately distinguishes modern composition—especially those of a school which aims at emancipating itself from ancient rules.

Mr. Bodley, R.A. (chairman), thought the paper was the most able and interesting account of the old screens in the West of England churches. It not only dealt with the history but also with the art of the subject. The running vine patterns were full of beauty. He had examined some of them, and might remark that he had some delight in carved fragments of them in his office which were given him by the late Lord Devon. They were almost always gilded on red, which gave a warm tint. There were two very different ideas of the interior of a church. The one was to have it all open to view, so that it might appear spacious and grand and present an uninterrupted vista. That was the Classical and is the modern idea. The Gothic plan is the opposite to this. Here the interior is screened and we have the conception of mystery—an indefinite space beyond. A dark screen may stand up against a bright golden east end. If nature was to be the guide in art, there can be no doubt that the screened effect is the one most in accord with it. The Chairman further said that he remembered walking on a road that wound its way half up a green hill that rose out of a vast level landscape. Between hill and this wide view of long stretching land there were trees standing, screenlike, with their high stems and the trace of their branches. They stood out dark against the background of the vast stretch of land that was bathed in sunlight. Presently, as he walked on, the trees came to an end and all the broad low-lying land was displayed to his eye. The view was fine, but the entrancing beauty, the mystery of a half-seen view was gone. The poetry was turned into prose and the richness of effect to comparative poverty. With the less seen view of the plain the effect was one of indefinite, well-nigh an infinite, appearance of space and distance. But when all was seen there was a loss—a loss even of size and distance. The half had been greater than the whole, as it often is in art. Here then was the screen

as contrasted with the unbroken vista idea. How more beautiful the screened scene was than the open one words could express. While he was familiar with a few screens that had been exhibited, he was a little sorry more of the Eastern counties' screens had not been shown, because he knew them best. The screen at South was a great work of art. It was rather interesting that at church there were two screens, the centre screen the screen at the side, which were entirely different. The centre one, which was a little earlier, was full of art, the other was rude. He was sorry to have to say he believed the painting on the centre screen was a fine work, and was almost worthy of Van Eyck or Vermeer; the painting on the side screen was English and very rude and elementary compared with the Flemish

WHISTLER'S "CARLYLE."

WHEN the galleries and museums of art committee of the Glasgow Corporation decided to purchase the portrait of Thomas Carlyle there was much opposition. A graphic account of the transaction by Robert Crawford, LL.D., lately appeared in the *Glasgow Evening News*, in which he said:—I happened at that time to be chairman of the galleries committee, and in that capacity was largely responsible for carrying through this business. In those days the Corporation was a very old and conservative picture buyer; we had bought pictures for some years, and had over £4,000 in hand, waiting on something good to turn up. The proposal to purchase Whistler's "Carlyle" really originated in the Art Club, largely owing to the influence of Mr. E. A. Walton, and by Mr. James (now Sir James) Guthrie, a memorial signed by over ninety artists and others, including Sir John and Orchardson, after which a deputation waited on the galleries committee and urged them to buy the portrait. The picture had been shown in Paris, Berlin, Munich, Vienna and Edinburgh. Some discussion arose in Edinburgh, when it was shown there, as to the commercial wisdom of purchasing it at the price of 400 guineas, which the value put upon it then. Whistler, when he heard of this discussion, promptly telegraphed that the price was 400 guineas, and it was at this price the Corporation of Glasgow were now urged to purchase the picture. The committee on galleries viewed the proposition favourably, and thought that a "deal" might be made for perhaps eight hundred instead of a thousand.

Next day I left for London, taking with me a municipal colleague somewhat Philistine in matters of art, hard of hearing and straight in speech, whose mission was to "squeeze" the price, while I took the office of sympathetic mediator determined anyhow to have the picture. We went by appointment and in considerable mental excitement to Cheyne Row, Chelsea, to interview the author of "Gentle Art of Making Enemies." The house, I remember, was almost devoid of furniture—a large drawing-room on the ground floor had a few screens and panels hanging about in its vast spaces. These seemed to be symphonies or nocturnes in blue, grey and silver—ghostly vague impressions of what seemed to be the Thames and bridges; but, as my Philistine colleague assured me, they could have been turned upside down without one missing which end was top and which was bottom. There were a few rush-bottomed chairs and a table, four bricks in the empty fireplace, and some bits of wood burned in the little square thus formed. My Philistine rubbed his hands with satisfaction at these symptoms of a "simpler life," feeling assured that his "squeezing" process was the more likely to be successful.

Mr. Whistler received us with great ceremonial, cordiality and impressiveness. He wore, *inter alia*, a brown velvet jacket and loose neck-tie, with hanging ends, and a pair of the Boul' Mich. His hair was oiled and combed and worn well down towards the shoulder. He stood as if on his tiptoes—his head daintily turned sideways, while his bright sparkling eyes and his general air of grace and grace somehow suggested to us the aspect of a rare or a love bird.

Cigarettes and tea—laced, I think, by a dash of lemon and a dash of rum ("Vienna tea")—were produced, and Whistler's talk—brilliant, eccentric, epigrammatic—very delightful and entertaining; but he shied off at the most remote suggestion of business. "The picture; yes, of course, the picture is yours. The great Corporation of Glasgow—most listened and humane—most liberal in its ideas—cer-

tainly into no better hands, can I desire to see my 'Carlyle' placed. With great pleasure I see that many artists with whom I have not the pleasure to see eye to eye have honoured me by asking you to take my picture for your city—I honour them for this."

"But," I said, "Mr. Whistler, we have not yet decided whether the picture can be ours. My friend the Philistine here and others in Glasgow think that the price now fixed is perhaps too high, and we think of suggesting—say, 800 guineas."

"My dear ruddy-faced Scot," replied Whistler, "what is this we are doing? You and I will never condescend to haggle about money. If it was in my power to bestow this picture on the people of Glasgow as a gift I would gladly do so, as a proof of my appreciation of their good judgment in desiring to possess it. They do so choose, do they not? Alas! I cannot make it a gift and I wish you to have it. What need, then, to discuss the question of money? But you have not yet seen the picture. It is not here; tomorrow will you give me the felicity to see you again and I will show you the 'Carlyle'?"

As we were preparing to leave, my Philistine friend ventured out of the financial into the artistic arena, but was sorry for it a moment after. "Is it true," said my colleague, "that, as I have heard, modern pictures don't stand so well as the old masters? The colours, they say, fade sooner?"

To which Whistler, in a perfect blizzard of intonation and gesticulation, replied, "No, it is not true—modern pictures do not fade, and therein lies their complete damnation."

Next day—a fine sunny afternoon—a bright welcome more tea and cigarettes, smiles and delightful little rushes of epigrammatic talk as before. Still intent on business, I, said in my most sympathetic and ingratiating voice:—"Now, Mr. Whistler, have you, since we saw you yesterday, thought any more about the price of the 'Carlyle'?"

"My dear friends, most estimable of Scotchmen," replied Whistler, "I have indeed been thinking, but only on the anticipation of again seeing you this afternoon, after our delightful chat of yesterday—and now that you are here let us talk, smoke, drink tea and be happy."

Upstairs the picture was displayed on an easel—the Philistine and I putting on the airs of practical experts, walking back and forward, and scrutinising the beautiful picture from various points of view.

The Philistine then, clearing his throat, said in a firm voice, "Mr. Whistler, do you call this life size?"

"No, I don't," snapped Whistler, with a gesture which said plainly, "if I could I would throw you out of the window." "There is no such thing as 'life size.' If I put you up against that canvas and measure you, you would be a monster."

The Philistine was now considerably crushed; Whistler was irritable; I began to quake in fear of an eruption, and was trying to throw the oil of sympathy over the troubled waters, when my somewhat crest-fallen Philistine comrade made one more rash conversational venture. "The tones of this portrait are rather dull, are they not? Not very brilliant, are they?" he said.

"Not brilliant! No; why should they be? Are you brilliant? No. Am I brilliant? Not at all. We are not 'highly coloured,' are we? We are very, very ordinary-looking people. The picture says that and no more." There seemed nothing more to say after that, and so the Philistine and I departed, after promising to send a cheque for the picture, highly charmed with the gay persiflage of the greatest of modern Impressionists.

The London Geological Field Class, conducted by Professor Seeley, F.R.S., begins its twentieth year's season on Saturday, April 29, with a visit to the North Downs at Betchworth. The field class, which is carried on continuously on the Saturday afternoons in May, June and July, affords practical teaching in geology by studying direct from nature the structure and modes of occurrence of the rocks in the basin of the Thames and adjacent country. Further particulars may be obtained from the secretary, Mr. J. W. Jarvis, F.G.S., St. Mark's College, Chelsea, S.W.

A Church is about to be built in New York of a novel class. The church is the Broadway Tabernacle, and a site has been secured at the corner of Broadway and Fifty-seventh Street, where, on a lot 100 feet by 100 feet, a ten-storey steel construction will be erected. While the general design will be of an ecclesiastical character the new building will have numerous classrooms, a library, baths, gymnasium and kitchen.

Re Essex, Nicol & Goodman Partnership Dissolution.

SIR,—We beg to inform you that the partnership heretofore subsisting between us has this day been dissolved by mutual consent. In future Mr. Oliver Essex, F.R.I.B.A., and Mr. John Goodman, will practise as Messrs. Essex & Goodman at the address below, and Mr. J. Coulson Nicol, A.R.I.B.A., will practise with his son, Mr. G. Salway Nicol, A.R.I.B.A., as Messrs. Nicol & Nicol, at King's Court, 117 Colmore Row, Birmingham. Both firms will have a London office at 25 Bedford Row, W.C. All moneys due to or from us will be received or paid by us at Colmore House, 21 Waterloo Street, Birmingham, or at King's Court, 117 Colmore Row, Birmingham.—Yours faithfully,
 ESSEX, NICOL & GOODMAN.
 Colmore House, 21 Waterloo Street,
 Birmingham: March 31, 1905.

SIR,—I have pleasure in intimating that I have taken my son, Mr. George Salway Nicol, A.R.I.B.A., into partnership, and will continue to practise with him at address below. During the eighteen years I have been associated with Mr. Oliver Essex, F.R.I.B.A., the firm has been engaged on several important works in Birmingham and district, viz. the Municipal Meat Market, Municipal Technical School, Barron's Stores, Lunt's Premises, Grainger & Smith's Factory, Preston Arcade, Newbury's Buildings, Christ Church Buildings, Newton Chambers, Cornwall Buildings, &c. Amongst current contracts the new offices of the Hearts of Oak Benefit Society, Euston Road, London, with other contracts, will be continued under my personal direction.—I am, yours faithfully,
 JNO. C. NICOL.

King's Court, 117 Colmore Row, Birmingham:
 April 5, 1905.

GENERAL.

A Collection of Paintings belonging to the late Mr. James Staats Forbes was sold last week at Munich for 13,000*l*. The highest price obtained was 1,525*l* for a picture by Lenbach.

Mr. W. Noble Twelvetrees read a paper on "The Design of Concrete-Steel Beams" before the Civil and Mechanical Engineers' Society on the 6th inst.

The Prefect of the Seine has made a proposal to the Municipal Council with a view to purchasing all the works which were in the studio of the sculptor, M. Dalou, at the time of his death. If the Municipality decides to purchase the works, a special room in the Petit Palais will be devoted to them.

Mr. Alfred East, A.R.A., has been appointed by the Municipality of Venice a member of the jury which will select the works for the International Art Exhibition to be opened on the 21st inst.

Mr. J. S. Sargent has been elected foreign associate of the French Academy of Fine Art, in place of the late Herr Menzel.

Professor Todilini has just completed the model for the monument to be erected in memory of the late Pope Leo XIII. The memorial consists of a sarcophagus, resting upon a granite base, on which stands a statue, 10 feet in height, of Pope Leo in his pontifical dress and with a tiara in his hand. On one side of the sarcophagus is the figure of a working man, and on the other a statue emblematic of the Church, holding in its hand an olive twig. The monument, which has been subscribed by the surviving cardinals created by Leo XIII., will be of a total height of 30 feet.

The Liverpool Cathedral Executive Committee, at their meeting on Monday, received a series of photographs from the contractors indicating the large amount of work requisite in preparing the pier foundations.

Mr. S. H. Hill Willis has been permanently elected surveyor to the Orsett (Essex) District Council.

A Paper on "The Manufacture and Testing of Portland Cement" will be given by Mr. A. K. Bamber (Managing Director of the Associated Portland Cement Manufacturers, 1900, Ltd.) at the meeting of the Society of Architects on next Thursday. The paper will be illustrated by biograph pictures, showing machinery, &c., in operation.

Mr. W. Whitaker, B.A., will read a paper before the of London College Science Society, entitled "Wh Hospital: Its Architectural Importance," on Friday the 14th inst.

The New English Art Club will open an exhibition Royal Institution, Liverpool, on the 17th inst. On the demolition of the Dudley Gallery there will be no exhibition in London.

The Council of the Institution of Civil Engineers resolved to recognise the ordinary degree of Bachelor of Engineering of the University of Liverpool obtaining the examinations of that University as equivalent to those of the Institution, as candidates from the associate membership examination of the Institution.

At Last Week's Meeting of the Edinburgh Architectural Association the president, Mr. J. T. Baillie, made reference to the loss which the Association, the city, the country, and even the colonies, had sustained in the death of Mr. George Henderson. He said that the work which Mr. Henderson did, at home and abroad, far and near, diversified and varied as it was in character and style, was always marked by scholarly as well as practical knowledge and by well-trained taste; and the results were things of beauty and usefulness, monuments of his own skill, and examples and models for the instruction of others.

The Late Professor Adolf von Menzel, the painter, besides innumerable sketch-books, 5,000 loose drawings valued by experts at 50,000*l*. His heirs have offered them to the German National Gallery.

Mr. Stanley Dunkerley, M.Sc., has been appointed the professorship of engineering at Manchester University. Mr. Dunkerley was a student of Owens College, obtained the B.Sc. degree of the Victoria University first-class honours in mathematics, and in the following year in engineering.

The General Purposes Committee of the Brighton Corporation have received a report that, by virtue of his appointment as deputy borough surveyor, Mr. Alfred Weller will carry out the duties of borough surveyor until September next, at his present salary. The committee recommend that Mr. Weller be appointed borough surveyor of Brighton and surveyor to the Sanitary Authority for the borough from September 29 next, at a salary of 500*l*. per annum payable quarterly.

The Edinburgh Dean of Guild Court have granted warrants for the construction of new engineering and physical laboratories at the Old Fever Hospital buildings, Infirmary Street, recently acquired by Edinburgh University Court. Alterations will be made on the High School Yards and there will be a lecture theatre, drawing office, &c. An engineering workshop will be erected in connection with the classes to be held there. The internal gables will be removed and 9-inch brick partitions substituted. The boundary wall is in some places to be rebuilt. The front of the building will not, it is understood, undergo alterations.

The Jury who are to examine the competitive designs for the Rothschild dwellings will consist of MM. Emile Cheysson, Gaston Griotet, Georges Picot, Robert Rothschild and Jules Siegfried; M. Schneider, secretary, and MM. H. P. Nénot, Louis Bonnier, Paul Wallon and Georges Roussi, architects. Two other architects will be selected by the competitors.

M. De Selves, the prefect of the Seine, proposes that the models and other works bequeathed to the Orphanage of Art by the late Jules Dalou shall be purchased by the Municipality of Paris.

The Death is announced of M. H. F. Iselin, the sculptor, at the age of eighty years. After studying with Rudolph M. Iselin obtained a gold medal in 1852 for his "Jeu de Romain," which was purchased by the State. For 50 years past M. Iselin had lived in retirement at Clairefontaine (Haute-Saône), his native village.

A Memorial Tablet has been placed by the London County Council on 48 Welbeck Street, the house in which Thomas Young, physician and Egyptologist, lived from 1800 to 1825. Young is known best for his exposition of the inscription on the Rosetta stone, which proved the key to the Egyptian hieroglyphics.

Professor Delitzsch has undertaken another series of explorations in Assyria and Babylon.

The Representatives of the French Academy of Fine Arts at the Archaeological Congress at Athens are MM. Bonna Marqueste and Bernier.

SIR R. ROWLAND ANDERSON, LL.D., Architect.

The Architect.

THE WEEK.

members of the National Art Collections Fund their first annual meeting on Friday last. The objects of this Society are similar to those of the Friends of the Louvre in France. But in one case there are enthusiastic millionaires, while in the other the funds contributed by the 551 members are limited in amount. However, although the Society has only been a short time in existence, several interesting objects have been added, viz. an old English repeating-watch, by WALTER RAY; a picture by WATTEAU, entitled *Fête Champêtre*; a volume of rare engravings and paintings, a copy of *The Martyrdom of SS. Peter and Paul*, by MICHELANGELO MAZZOLA; a plate of Rhodian faience, a Greek vase relief of the fourth century before CHRIST, and a small picture of the *Madonna and Child*, by BASTIANI. Without a large increase in the membership it cannot be expected that the fund will be able to make costly donations to museums or galleries. Co-operation can do much, and for the National Art Collections Fund there is a vacancy.

ANOTHER case which proves the necessity for a written agreement in architectural transactions has been heard at the Glamorgan Assizes. Mr. HERBERT TURNER, architect and surveyor, of Cardiff, claimed 10% damages from the owners of the Cardiff Heath estate for breach of contract and fees for plans used in the development of the property. He was instructed to prepare plans, which were approved by the solicitor to the estate, who had died in 1902. It was decided that he should have charge of the letting of the different plots, and he made arrangements with builders for building houses. In fact, he was to act as surveyor until the sale of the fifty-four acres had been built upon. On the solicitor's death the management was taken out of his hands. He consequently claimed for the amounts he would have received had he continued to hold office, at the same rate as was paid to other surveyors on the estate. Mr. TURNER was unable to produce any written agreement. Mr. ENGLISH HARRISON, who acted as commissioner, accordingly decided against the plaintiff.

THE subject of trade effluents is likely to receive unusual attention in the committee-rooms of the House of Commons during the present session. There is no doubt that trade refuse is one of the difficulties with which sanitary authorities are not always able to cope. It might be supposed that it should be regarded as a nuisance for which provision has to be made by local authorities. But if there was no check, it would be possible for a manufacturer to set up large works in a small town and compel the inhabitants to enlarge their sewers for his convenience. The Rivers Pollution Prevention Act says that local authorities are under certain conditions to give facilities for the discharge of liquids from factories or manufacturing premises into their sewers. But the sanitary authority need not give such facilities where the sewers are only sufficient for the requirements of the district. The report of the Royal Commission on Sewage Disposal recommends that it should be the duty of the local authorities to provide such sewers as may be necessary to carry trade effluents as well as domestic sewage, and that the manufacturer should be in the right, subject to the observance of certain safeguards, to discharge trade effluents into the sewers of the local authority. Instead of providing by direct agreement what those safeguards should be, the local authority should frame regulations (subject to confirmation by a central authority) which could provide definite standards for the different manufacturers as regards preliminary treatment of the effluents, and

power to vary the standards or to dispense with them altogether in special cases should be given. The committee who are investigating the Heckmondwike Improvement Bill consider that trade refuse should be restricted to the discharge of liquid refuse. But trade refuse includes solid matter, and the difficulty is, therefore, not surmounted if the regulations refer only to liquids.

THE reports of Dr. THRESH, the medical officer of health for Essex, generally contain information which will be useful to those who have to consider domestic water-supply. In the report which was presented on the 4th inst. he opposes the prejudice against wells. "I am becoming more and more convinced, as the result of my personal observations and my study of the distribution of typhoid fever," says Dr. THRESH, "that this disease is never caused by well water when the well is so constructed that no impurity can get into it without having filtered through 8 or 10 feet of soil." He also adds:—"No person need hesitate about taking up his residence in the country merely because he will have to use well water for drinking and domestic purposes. With a properly constructed well he may feel decidedly safer, so far as water-borne disease is concerned, than in drinking the Thames and Lea water in London, or the moorland water supplied to Manchester, Liverpool and other cities." The wells, however, do not yield a large supply except in the south-west of Essex, and they are better adapted for single houses or groups of houses than for towns.

In their report for 1905 the Council of the Devon and Exeter Architectural Society regret the absence of enthusiasm among the associates, as evidenced not only by the rare attendance at meetings, but by the lack of competition for the prizes offered by the Society. For the measured drawings only one set was submitted, and no sketches were sent in for the hon. secretary's prize. The Council also regret that the response from principals was insufficient to warrant embarking upon a scheme of lectures in connection with the London Architectural Association. For the present it must lie in abeyance. On March 24 a fairly representative meeting was held to listen to the papers of Mr. A. S. CROSS and Mr. GEORGE HUBBARD upon the subject of the "Statutory Qualifications of Architects." The resultant of the discussion was a resolution that the Society heartily approves of the principle of the statutory qualification of architects, and urges the Institute to press forward a Bill for that purpose. The Society consists of fifty members, ten associate members and twenty-seven associates.

THE Bessemer Gold Medal of the Iron and Steel Institute has been awarded this year to Professor ARNOLD, of the Sheffield University College. He has resolved to hand over the medal to the City Council, who provided the plant that was employed in the researches for which the medal was awarded. Without that aid the medal would not have gone to Sheffield in the year 1905. He acknowledges also his obligation to his staff for their hard work and devotion during fifteen years. Professor ARNOLD believes in rendering to CÆSAR the things that are CÆSAR's, and therefore he suggests "that as it seems probable that soon with university rank a new Board-room more in keeping with the dignity of the institution will be required, the medal, with its illuminated certificate and frame, be placed there between the Mappin medal boards, to remind students that although they have climbed up a somewhat steep slope, they are not yet quite at the top of the hill, and to encourage them to still further exertions." A tribute has been gracefully paid to the Sheffield Council, who will soon have the satisfaction of having a legalised and complete university in their city.

THE LIVERPOOL ARBITRATION CASE.

AMONG the benefits which are owing to WILLIAM III. the sanctioning of the principle of arbitration holds an important place. If we remember how firmly the English Courts clung to their privileges it required a strong will to have it declared by Parliament that "it hath been found by experience that references made by rule of Court have contributed much to the ease of the subject." The insisting on a rule of Court as a condition of successful arbitration revealed the resolution to keep the new system under the control of the judges. It was not possible until many years had elapsed to have a legal inquiry without an order of Court.

The conditions of business in our time may be said to demand arbitration. So much depends on technical details in many actions, it is not to be expected that the judges can master them from the statements of counsel and witnesses. There is in such cases an amount of drudgery to be gone through from which judges should be spared. Indeed, it sometimes happens that the terms employed can be considered as belonging to a different language. A few years ago it was necessary to compile a glossary to enable a Royal Commission to understand what was said by witnesses in an inquiry relating to trade, and a similar aid would often be of use in the courts of law. To experts all those terms are as familiar as ordinary monosyllables.

Apart from the obscurities of language, there are cases in which the evidence that is brought before the Court can only be, as it were, of a fractional kind. We sometimes find a judge expresses an intention to visit premises which are the subject of the action before him, and it is an avowal that what he has heard from witnesses or seen in models or diagrams is inadequate to enable him to arrive at a decision. Visits of the kind can only rarely be made by a judge, but an arbitrator would probably begin his work in that way.

The remarkable case between Mr. W. H. LEVER and the Corporation of Liverpool reveals the peculiarities of arbitration as now practised, as well as the support which the Courts afford to the procedure in difficult circumstances. Our readers are aware, we presume, of the history of the transaction, and we need not, therefore, enter into the details of it. Mr. LEVER in 1900 purchased a large tract of land for 60,000*l.* Part was presented by him to the people of Bolton to form a public park, a part was to be used in connection with a residence for himself, and the remainder was to be developed as opportunities arose. Additional land was acquired in order to make the estate compact. Roads were also opened. As the land was in the vicinity of the Liverpool reservoirs the Corporation became alarmed, and in 1892 obtained an Act giving them compulsory powers to secure additional lands, or, in other words, to acquire Mr. LEVER's property.

The action of the Corporation was justified. There would be danger to Liverpool if the reservoirs were affected by the existence of a town or village near them. It would have been more prudent if they had anticipated the risk and purchased the ground before Mr. LEVER could have arranged for it. The water supply had, however, cost an enormous sum, and the necessity of possessing so large an area of land would probably be disputed. The question to be decided was what sum was to be paid. The area of Mr. LEVER's estate was 2,200 acres, of which 400 acres were given to Bolton. There was consequently four-fifths of an estate remaining which cost 60,000*l.* The value of land, we need not say, is extremely elastic. If tested by its agricultural use it is supposed to stand at a low rate in this country. But the capabilities of land are not easily measured. If used as a building estate the value would be far higher. But in this case the land was indispensable, and, what is more, there could be no competition. The system of water supply would have to be transformed if the reservoirs were to be free from the encroachment of dangerous elements.

Mr. LEVER, who understood the problem better than anyone else, asked the large sum of 459,000*l.* for four-fifths of an estate for which he paid 60,000*l.* There were no doubt expenses incurred in laying out roads, and some interlacing pieces of land were purchased, but against that may be set the part of the estate which was attached to his residence. It was therefore necessary to determine the amount to be paid by arbitration.

The arbitrators appointed were Mr. ROBERT VIGAN, who has valued a great part of England for railway and other purposes, and Sir EDWARD BOYLE, who has gained experience as an architect, a surveyor, a barrister, and as a writer on compensation. Mr. REGINALD EMPEROR MIDDLETON was selected as umpire; he has had a wide experience of waterworks abroad and at home, and is an engineer to a great many municipal councils for water supply. Three such experts should gain the confidence of the most sceptical. They had a difficult task before them, for, as a matter of course, there must have been divergence among the valuers. According to one witness the value of the land was 40,000*l.*—an amount which we conclude was based on the price given for it by Mr. LEVER. Another witness considered that 200,000*l.* would be a fair price for the ground.

Everyone accustomed to such investigations is able to make allowances for vast differences between valuations, and the umpire could have made his award at his office in Westminster. But a curious claim was set on by the Liverpool Corporation which prevented such a course being adopted. They boldly declared that although they were not owners of the land, yet they were in the position of riparian owners, and were entitled to claim not only all the rain-water which fell upon the land, but also any water which flowed beneath the surface. That it was ingenious strategy cannot be denied. It might be supposed to be a trap for the umpire, as according to one view the determination would involve a question of title which was outside the arbitration. Mr. LEVER, of course, refused to recognise the assertion and claimed a right to all water except such as flowed in defined channels. If such a theory as that maintained by the Corporation could be upheld the value of the estate would be much diminished. In any case, it became necessary for the umpire to have an ocular demonstration of the conditions of the water on the estate. Mr. MIDDLETON accordingly went there in July.

Under ordinary circumstances no importance would be assigned to the visit of an umpire to the property with which he was for the time being connected. But the visit was utilised by the Corporation in a way that is without precedent in the history of arbitrations, and which is not likely to be repeated. Consulting engineers in Westminster are not usually able to tramp over fields as quickly as they were in their younger days when they had to take sections or lay out curves in a hurry. Mr. MIDDLETON, who is sixty years of age, suffers occasionally from malarial attacks, which are the consequence of residing in hot climates. After two days' toiling over the moors he was knocked up. Whereupon at the instance of Corporation officials a doctor was sent to examine the umpire. He found him in his bedroom smiling and walking, and came to the conclusion that Mr. MIDDLETON was out of condition, but with no grave or mental symptoms of any kind. The doctor expected to be paid by the Corporation who had employed him, but he was told to send his account to the patient. Mr. MIDDLETON, who was not aware of the conditions, paid the doctor and returned unattended to London. We shall soon explain what use was made of the incident.

By the Arbitration Act of 1889 an award is invalid unless it can be shown that the arbitrator or umpire was one-sided, or that he allowed himself to be deceived by any of the parties, or had not conducted the inquiry in a proper way. The Corporation resolved to impugn Mr. MIDDLETON's award, that Mr. LEVER was to receive 138,449*l.* on the ground that as he was seriously ill his memory was impaired, and that he was at least

temporarily incapable of properly adjudicating upon the matter. It was no doubt true that the time for making the award had been extended. But no injury arose to either parties from the delay. If a slight attack of illness is a bar to a sound judgment, then many of the decisions given in the law courts must be unjust. Judges do their work fairly, although they may have had to see their physicians before they entered the Court, and may have to swallow medicine while on the Bench. Knowing what has to be sustained by professional men of all kinds, Mr. Justice WARRINGTON, who tried the case, was justified in expressing surprise that a body like the Liverpool Corporation should have adopted such a plea, for which there was not a particle of evidence. It is needless to say that the award was declared to be valid and that the Corporation will have to pay the cost of the arbitration as well as the law costs.

It will follow from Mr. Justice WARRINGTON's action that the position of an arbitrator must be considered more secure than it was. Whatever may be the capabilities of a man who undertakes such an office there is a possibility that he may conduct the inquiry in a manner which does not always correspond with that of the Appeal Courts. Some judges are not always serious. But if an architect or an engineer were to imitate their lighter moods one of the parties would be likely to say justice was not done. A slight attack of illness would also be supposed to seriously affect the arbitrator's judgment. Henceforth, in order to have an award set aside it will be necessary that the arbitrator must be guilty of the misconduct or other offences which are described in the Act.

THE WATER-COLOURS SOCIETY.

It is an advantage in the exhibitions of the Society of Painters in Water-Colours that we are able to compare the influences both of tradition and innovation. There are members who are still faithful to transparent colours, and who impart to their dainty little drawings the finish of a miniature. Other members and Associates admit few restrictions except those imposed by the use of paper and of colours mixed with water. The result is that many varieties of drawings are to be seen this year, and the exhibition, although confined to one room, affords subjects for enjoyable study during several visits.

Some drawings this year are unusually large. Mr. E. ALEXANDER'S *Peacock and Python* measures 70 inches by 40 inches. It required courage to select such a subject, and only a vigorous hand could draw the long lines of the bird's feathers, with which the serpent appears almost parallel. But justice is hardly rendered to the python, for on such occasions the skin loses its gloss and shines as if by the victory. Another drawing of a novel kind and the work of an Associate is the *Theodore and Honoria*, by Mr. H. E. CROCKET. It presents a scene in the strange story which DRYDEN translated from BOCCACCIO. The subject was hitherto neglected, for a more difficult one could hardly be found. For what would now be considered as a mere vision—the continuous murdering of a woman by a mounted knight—has to be treated as a reality. Mr. CROCKET has interpreted the legend in the spirit of the Florentines who first heard it. There is nothing suggestive of the stage vision. The table is placed amidst tall trees, and the chase passes close to the guests.

The guests are startled, but look upon the tragedy as if the actors were living beings, and not ghosts. Such a drawing reveals a power in composition with several figures which is not common with water-colour artists. Mr. CROCKET has two other drawings, a benign *St. Elizabeth*, who is seen carrying a child along a street, and a *Tannhauser*, where the knightly bard appears to be listening to the Rhine maidens. In this so we have novelty, for a floating figure is detached, so that two drawings are given instead of one. Mr.

CADOGAN COWPER in *Molly, Duchess of Nona*, shows a bust of a young Italian girl in an elaborately ornamented robe who is strangely reminiscent of the older *Mona Lisa*. Mr. WAINWRIGHT, who is also an Associate, in his *Covenanter's Sermon*, a *Linner of the Olden Time*, and *An Impromptu*, contributes drawings which are not easily passed over. They are experiments in strongly marked light and shade, and stand out with almost the force of relief.

This year we see several methods of representing architecture. Mr. J. S. SARGENT'S *Palazzo Grimani* would be likely to horrify a quantity surveyor from its being made up of disconnected spots of colour. But at the right distance they all fall in their places and suggest the lower storey of a Venetian building. The treatment, however, seems better adapted for his *Bed of a Torrent*, where there are detached boulders. Mr. REGINALD BARRATT'S manner is different, and we may say more reverential. He has an admirable view of the entrance of the Ducal Palace, Venice, with the sculptured figures, and an entrance to St. Mark's, in which the mosaics are represented in brilliant colours. He has also a view of the great church at Dordrecht, the abbey at Middelburg, and the Campo Santo at Venice, as seen from the canal. In all of these the buildings, however much they differ in style, are depicted truthfully. Miss CLARA MONTALBA'S representation of the *Redentore, Venice*, would delight a French impressionist. The lines of the building, the procession with banners up the steps, the boats and crowds are shown in the thinnest of sienna. It is, therefore, more suggestive of a thought than of an architectural representation. But it has merits, and recalls PALLADIO'S building, which is not his masterpiece. Mr. ALBERT GOODWIN shows views in several towns, from Grenada, in the West Indies, to Bosham, in Sussex. In his *Lincoln* the cathedral appears, but the pencil has to be aided by the pen, for lines in Indian ink are used to emphasise the arcading. The most characteristic of his drawings is *The Last Act and Fall of the Curtain, Pompeii, A.D. 79*. In it we see the amphitheatre—not quite as elliptical as the original—from which the crowds have escaped, for Vesuvius is emitting flaming embers in the background. Mr. T. M. ROOKE has three drawings of French subjects, with two from Westminster Abbey, in which details are honestly given. What a fine series his views of the building would make if collected. Mr. HERBERT MARSHALL attempts the *Tower Bridge* as seen from the roadway, from which the anomalous structure looks more unsuitable than from the river. The subject was not worthy of his pencil. River scenes have not yet lost their interest. Mr. HODSON'S view of the Houses of Parliament appears to be foreshortened to excess, and the length of the building is not made evident. Mr. GOODALL has given one of the ever-popular views of St. Paul's from the Surrey side. The *Open Air*, by Mr. THORNE-WAITE, looks like a view of the Sussex Downs. Sir FRANCIS POWELL has a vigorous seascape which is called *Staffa from the North-East*, the little island appearing on the horizon. The view of Snowdon, which is a large drawing, is one of Mr. CLARENCE WHAITE'S most successful works. Only opaque colours are used for it. It is enough to demonstrate that the praise which the mountain is now receiving is justified. *The Cross Roads*, by Mr. TOM LLOYD, and his *Last Waggon* are delightful drawings of country scenes. *Wings of the Morning*, by Mr. E. R. HUGHES, treats the same theme as GUIDO'S *Aurora*, but instead of amorini there is a vast number of birds of varied plumage, while the birds of darkness wing their way to lower regions. As an imaginative work it merits recognition, but the execution is admirable, and the figures suggest flying.

The office of President in such a Society cannot fail to have an effect upon the holder's works. He must respect the past and curb his invention. Sir ERNEST WATERLOW continues to give transcripts from nature

which can be considered as successful without being remarkable. In *The Chalk-pits on the Sussex Downs* we see a somewhat bolder treatment, and *A Dorsetshire Common* almost makes us feel we are in the open air. But with all their merits we feel the artist could have accomplished much more under other circumstances. Mr. ROBERT LITTLE's *Gateshill* is so luminous as to appear almost like a work in oils. Mr. PATERSON's *Nameless Hills* is more a view of clouds than of the earth, but they belong to Scotland rather than to the South. His *Arthur's Seat* is a panoramic view produced by a few large washes. The night scene by Mr. EYRE WALKER, *Aysgarth Force in Flood*, shows daring, and is well adapted to the subject, for the rush of water seems more mysterious. It offers a curious contrast to its bright neighbour, *Clappersgate Village*, by Mr. CUTHBERT RIGBY. In *Rocks on the Greta*, by Mr. JESSOP HARDWICK, a strong contrast is offered between the barren mass and the rich vegetation around. But the most effective of those scenes comes from Ireland, viz. *Caragh River*, by Miss MILDRED A. BUTLER. Mr. HEMY contributes three marine views. The surging waves in the *Fishing Boats off Brixham* shows a master's hand.

Mr. WALTER WEST has only one drawing, which is delightful: a lady, apparently a Quakeress, thinking over a letter, which to her is *A Weighty Consideration*. The figure would serve for RACHEL GEDDES in "Red-gauntlet." Mr. ARTHUR HOPKINS has a graceful full-length figure of ROSALIND reading the verses, which would be a fitting companion to the Quakeress. *The Magic of Pan's Flute*, by Mr. WEGUELIN, presents a nude nymph in the hollow of a tree who is listening to the god. This is a charming work. The *Citharistria* and *Tibicina* are two of Mr. BULLEID's classic figures, and the most successful of those he has given of late years. In both drawings the figure is supplemented by a Bacchic relief as a background. They are among the gems of the exhibition. Mr. GLINDONI does not present a humorous scene this year, for his only work is *The Betrothal*, a scene from "The Bride of Lammermoor;" it is a favourite incident with painters. In this case there is a departure from the stage types of the ill-fated lovers. Mr. ARTHUR RACKHAM, in *The Princess's Mirror*, makes the ground appear as if it were marble, which has a curious effect. His principal drawing is *Pleasure Seekers*, in which geologists, photographers, mountaineers and other followers of pleasure are congregated within one frame. Mr. MACBETH's *The Ebb Tide*, a group of fisher-folk, does not manifest his customary and exquisite finish, and probably was too early taken from the studio.

On the walls there are 257 drawings, and fortunately not one among them can be considered as a failure. In many cases there is originality of subject, and, indeed, each canvas has something to recommend it. But it is becoming more plain every year that if large drawings continue to be sent in, and if some of the members will send a dozen examples, the wall space is too limited for justice to be done to them all. An amateur who would be resolved to examine all the works that are to be seen would have to go through a wearisome pilgrimage on his knees, for at least one-half the drawings are below the line of vision. If it is not possible to utilise some of the other rooms on the premises for exhibitions a reform will be necessary.

An Interesting Marble Tablet has been discovered during excavations in Vere Street in connection with the Holborn to Strand improvement. The tablet represents a man seated with a youth standing before him, and bears an inscription in the Greek language. Dr. Haverfield, of Christ Church, Oxford, has investigated the inscription, and states that the tablet is sepulchral in origin, and that although of an ancient date it is probably a modern importation into this country. The tablet is to be preserved for the present at the Horniman Museum.

ART GALLERIES, ABERDEEN.

ON Saturday a new sculpture gallery, which is an addition to the Art Gallery in Aberdeen, was opened by Sir George Reid, ex-president of the Royal Scottish Academy. The trustees of the late John Clark gave £8,000 towards the cost of the building, leaving a balance of £4,000 to be subscribed. The gallery contains about 100 casts of masterpieces of sculpture, some of which are not to be seen in the South Kensington collection or elsewhere in Great Britain.

Sir George Reid delivered an address. He recalled the history of the Institution, remarking that without Mr. James Murray Aberdeen would have had no such gallery. It is difficult to speak of Mr. Murray in his presence, and it is not easy to find words to express sufficiently his (Sir George's) admiration of the untiring energy, enthusiasm, and self-sacrifice which he had shown since he took up the matter. Professor Ramsay, of the University, had done much for the movement. In the selection of the committee had throughout had the benefit of the counsel and untiring assistance of Mr. Robert F. Martin, of the South Kensington Museum, to whom they were indebted for the admirable arrangements and groupings in the different courts. Going on to speak of the contents of the sculpture gallery, he pointed out, says the *Glasgow Herald*, that unfortunately much of what had survived of ancient art had come down to us in a mutilated state. Nearly all the finest Greek statues were mere wrecks. The frost and the rain of long centuries had marred the surface, but man had always been the great destroyer. Goth and Vandal, Christian and Turk, alike by turns had a hand in the work of destruction. The interest of the examples given of the sculptured art of Egypt, Assyria, and Greece was chiefly historical. There was a strange oppressiveness and dignity about Egyptian sculpture, but it was bound by narrow rules and deeply influenced by religious tradition. The earliest works which had come down to us were generally the best. It was an art arrested in its growth, and was never able to work out its full freedom. Assyrian art never got beyond the carving of surfaces, and like that of Egypt, knew neither progress nor development; but the Chaldeo-Assyrian sculptor could express the form, motion and character of animals in a quite surprising way. Early Greek sculpture had affinities to that of Egypt, but the Greek race resembled the Egyptian in nothing. It had neither the same original customs, nor the same beliefs. The Greek artist was constantly endeavouring to create his own individual ideal type, and in the end gave the world the most perfect works in sculpture which have ever come from human hands. Greek sculpture dealt chiefly with the ideal representation of the human body—but to make a splendid statue of marble it was necessary, in the first place, to make the living man, and great sculpture developed in Greece at the same period as the institution by which was formed the perfect human body. A noble trait of the body went hand in hand with the discipline of the mind. From the age of sixteen to eighteen the young men and women spent their days in the gymnasium—not to cultivate the mind, but to develop and perfect the body—and those unskilled in the exercises of the gymnasium were looked on with contempt as tradesmen and mechanics. The result in course of time was a beautiful race, and the sculptor perfected what nature had partly done. We were, as a nation, at last beginning slowly to realise the importance of physical training for the young. The sight, common enough, of slender, underfed, spectacled children creeping to school under a load of books, of multitudes of under-sized young men and women in our large manufacturing towns, and the statistics of the army recruiting department were, to the least of it, not reassuring. Although the space at the disposal of the committee was very limited, an effort had been made to illustrate the development of Greek sculpture from the early Archaic period till its culmination in the time of Phidias, and the examples ranged from the rude stelæ to the godlike forms of the figures from the east pediment of the Parthenon. The Roman, occupied with more serious affairs, war, conquest and the administration of conquered territories, had little natural aptitude for art, and was long indebted to the Etruscans in such matters. After the fall of Syracuse, Etruscan influence gave way to that of Greece, and the craving for works of Greek art in Greece and its colonies were spoiled and robbed of their art treasures by a horde of depredators, who carried them to Italy by hundreds of thousands. Greek sculpture

flocked to Rome as the new artistic centre of the world. Greek became the fashionable language; everything was Hellenised. Innumerable works belonging to what was known as the Græco-Roman period fill the museums of Europe, works often less characterised by the ideal than by an almost brutal realism.

After the fall of the Roman Empire the art of sculpture suffered a long eclipse. The gods—great and small—had vanished into darkness. But one of them, "The guardian of the flocks and herds, the all-pervading spirit of the fruitful earth," with his horns, shaggy goat's legs, budding tail and wicked yet kindly face, and who, as gods went, appears to have been not a bad sort of fellow—was destined to reappear later as the devil of popular Christian superstition. If we may judge by his constant presence in gargoyles and corbels, the Gothic sculptor found a fearful joy in carving him. The mocking demons that look down on Paris from the western towers of Notre-Dame were characteristic examples of his genius in that direction. In the early centuries of Christianity carving or modelling the human form was denounced as idolatry, and artists were regarded as "men of infamous occupation"—all the gladness of art had fled before the ascetic spirit of the Christian Church, so utterly opposed to the Greek ideal of the dignity of that bodily frame which they believed they shared with the gods themselves. The body was regarded as a thing to be mortified and held in contempt, and the doctrine of the depravity of the flesh, if we were to judge from the figures in the painted windows of Mediæval cathedrals and in the works of the primitive painters, resulted in the human form degenerating into lank skin and bone. It was difficult to fix a precise date for the beginning of the Renaissance movement, of which Italy was especially the nursing mother. It resulted from two currents of force—intellectual revolt against the bonds of scholastic theology and the extreme spirit of asceticism to which he had referred, and to this was joined an insatiable desire for knowledge. It permeated and transformed philosophy, science and religion, while the revival of classical knowledge and the study and imitation of ancient sculpture gave a new impetus to art. Much had been written regarding the Renaissance, its worldliness, pride, luxury, love of art and of good Latin, as well as of its wider and freer intellectual life which opened men's eyes to the beauty and wonder of the world in which they lived, and made life a thing to rejoice in. But there was only one aspect of the movement to which he would make a passing reference—the strange mixture of Christianity and Paganism in much of its art. Ruskin had frequently referred to this, and Browning had given us a vivid glimpse of it. When "the bishop orders his tomb in St. Praxed's Church," every detail, sacred or profane, of its ornamentation is minutely gone into, and

Pans and Nymphs, the Saviour at His Sermon on the Mount,
Saint Praxed in a glory, and one Pan
Ready to twitch the Nymph's last garment off,
And Moses with the tables . . .

and all were jumbled together on terms of complete equality. There was a fine representation of the sculpture of this period in the eastern gallery, including examples of the work of Donatello, Ghiberti and the Della Robbias, but separated from their natural surroundings and crowded into museums they inevitably lose something of their subtle charm.

Sculpture had never been as popular an art as painting in northern countries. It belonged rather to the more genial south; our cold, grey skies seemed unfavourable to its development, and while Scotland could show a goodly line of painters, its sculptors were comparatively few in number. It remained to be seen what use Aberdeen would make of this fine collection of casts which the Art Gallery committee had, with an amount of labour and trouble which they could scarcely realise, brought together. The students at the University, in Gordon's College, and in the neighbouring School of Art, the carvers in wood and granite, and the proverbial "man in the street," would each find something from which knowledge may be gained, and in those who had eyes to see the sense of the beautiful would be developed and strengthened. Those citizens who had all long taken an interest in the gallery had reason to be satisfied with its progress and the position it had now attained. They had had their share in establishing what was not merely for the present, but what was certain to be of lasting benefit to the community, and to all who had co-operated in the work he was sure he might, on behalf of the chairman and committee, return their most hearty

thanks. He trusted that these galleries would always be kept open free of charge, and he could not for a moment imagine that in a city of the size and importance of Aberdeen there could be the slightest difficulty in maintaining, and from time to time adding to, the contents of a building in which there was now much that was both instructive and beautiful.

LONDON COUNTY COUNCIL OFFICES.

THE latest report of the establishment committee of the County Council of London contains the following information relating to the proposed Westminster Bridge site:—

In considering the reference of the Council of December 6, 1904, we resolved at the outset that it was eminently desirable that the proposed new offices should provide accommodation not only for the staff of all branches of the Council's service, which could be administered from a centre, but also allow some room for expansion.

With a staff properly concentrated and arranged for in one building, an efficient system of organisation would be provided with more economy of space than is possible under the present conditions, and we would also hope that an economy in the service might itself be effected by reason of the large amount of work now entailed upon the staff in consequence of the separation of its various parts.

With regard to the accommodation of the staff, the number of rooms required for single occupants, namely, chief officers and their principal assistants, need not be much in excess of those now provided, but it should include rooms at the central offices for the chief officers of such services the staff of which will not be brought to the county hall. Also it would be well to arrange for a few smaller rooms in the building, so that in the event of the Council's duties being enlarged to any great extent the provision of rooms for chief officers might not be a difficult matter. The next requirement to which we have to draw attention is the accommodation of the drawing staff. For this purpose it is desirable that rooms of varying sizes, capable of accommodating the staff on any one scheme, and containing provision for a room for chief draughtsmen, should be provided. Offices of this kind would be required for the engineer, the architect, the valuer, the chief officer parks department and the asylums department, and for the purpose of meeting emergencies which it appears to us will inevitably occur in these departments from time to time we would suggest the provision of three additional drawing offices not allocated to any particular department, but capable of being used as emergency may dictate.

The next section is that of the technical assistants who require special accommodation, such as the staff of the chemist and the electric meter branch of the engineer's department. The accommodation at present provided for this work is not only extremely limited, but is not in that form in which it can be best used, and undoubtedly additional space will be required in order to make good this deficiency.

We then come to the provision of rooms for the officials in the higher ranks of the service. These officials should, without requiring a special room for each, be placed in a more or less quiet room associated with perhaps not more than two other officers.

Special provision will have to be made for the Council's typewriting staff, and it will have to be larger than at present provided, because under a more regulated system we apprehend that a greater amount of purely clerical work will be entrusted to the typewriting branch. On account of the noise of machines these rooms would have to be comparatively small, though opening out of each other.

The professional and clerical sections of the tramways department should also be accommodated if possible at the county hall. Not only is it an advantage to the public to have one *locus* for all services, but when the northern system is developed the county hall will be more central than the present head office at Camberwell.

It is a point whether the stores can be wholly provided on the new site, but if this could be arranged or partially so it would be a considerable advantage. With regard to the education stores depot at Clerkenwell Close, neither the number of the staff nor the particulars of the premises are included in the figures contained in this report.

Finally, the general staff should, in our opinion, be provided with larger rooms than at present exist, so that organisation and superintendence may be better provided

for, and less space may be occupied in the separation of the rooms.
